  - Child 2 months: 0.5 mL for 1 dose, injected preferably into deltoid region (or anterolateral thigh in infants), for information about the use of paracetamol for prophylaxis of post-immunisation pyrexia, see p. 260.
  - Child 4 months: 0.5 mL for 1 dose, injected preferably into deltoid region (or anterolateral thigh in infants), for information about the use of paracetamol for prophylaxis of post-immunisation pyrexia, see p. 260.

**Immunisation against Neisseria meningitidis, primary immunisation booster dose**
- **BY DEEP INTRAMUSCULAR INJECTION**
  - Child 12–23 months: 0.5 mL for 1 dose, injected preferably into deltoid region (or anterolateral thigh in infants)

**Immunisation against Neisseria meningitidis, primary immunisation (in unimmunised patients)**
- **BY DEEP INTRAMUSCULAR INJECTION**
  - Child 6–11 months: 0.5 mL for 2 doses, separated by an interval of at least 2 months; booster dose of 0.5 mL given between 1–2 years of age and at least 2 months after completion of primary immunisation, injected preferably into deltoid region (or anterolateral thigh in infants)
  - Child 12–23 months: 0.5 mL for 2 doses, separated by an interval of at least 2 months; booster dose of 0.5 mL given 12–24 months after completion of primary immunisation, injected preferably into deltoid region (or anterolateral thigh in infants)
  - Child 2–10 years: 0.5 mL for 2 doses, separated by an interval of at least 2 months. Injected preferably into deltoid region (or anterolateral thigh in infants)
  - Child 11–17 years: 0.5 mL for 2 doses, separated by an interval of at least 1 month. Injected preferably into deltoid region

**SIDE-EFFECTS**
- Rare Kawasaki disease - symptoms of meningitis reported (but no evidence that the vaccine causes meningococcal C meningitis)
- Frequency not known Unusual crying

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

- **Bexsero** (GlaxoSmithKline UK Ltd)
  - Bexsero vaccine suspension for injection 0.5mL pre-filled syringes | 1 pre-filled disposable injection £75.00

---

**Meningococcal group C vaccine**

**INDICATIONS AND DOSE**

**Patients with confirmed serogroup C disease (who have previously been immunised)**
- **BY INTRAMUSCULAR INJECTION**
  - Child 1–17 years: 0.5 mL for 1 dose, dose to be given before discharge from hospital

**SIDE-EFFECTS**
- Rare Symptoms of meningitis (but no evidence that vaccine causes meningococcal C meningitis)

**DIRECTIONS FOR ADMINISTRATION** Menjugate Kit® may be used via subcutaneous route in children with bleeding disorders.

**PRESCRIBING AND DISPENSING INFORMATION** Available as part of childhood immunisation schedule from www.immform.dh.gov.uk.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

- **NeisVac-C** (Pfizer Ltd)
  - NeisVac-C vaccine suspension for injection 0.5mL pre-filled syringes | 10 pre-filled disposable injection £187.50

---

**Meningococcal groups A with C and W135 and Y vaccine**

**INDICATIONS AND DOSE**

**MENVEO®**

**Primary immunisation against Neisseria meningitidis**
- **BY INTRAMUSCULAR INJECTION**
  - Child 13–15 years: 0.5 mL for 1 dose, preferably injected into deltoid region

**Immunisation against Neisseria meningitidis in an unimmunised patient**
- **BY INTRAMUSCULAR INJECTION**
  - Child 10–17 years: 0.5 mL for 1 dose, booster dose is not required

**Immunisation against Neisseria meningitidis in those at risk of exposure to prevent invasive disease**
- **BY INTRAMUSCULAR INJECTION**
  - Child 3–11 months: 0.5 mL every month for 2 doses, dose preferably injected into deltoid region
  - Child 1–17 years: 0.5 mL for 1 dose, dose preferably injected into deltoid region

**Patients attending university for the first time (who have not received the routine meningococcal A, C, W135, and Y conjugate vaccine over the age of 10 years)**
- **BY INTRAMUSCULAR INJECTION**
  - Child 16–17 years: 0.5 mL for 1 dose

**NIMENRIX®**

**Primary immunisation against Neisseria meningitidis**
- **BY INTRAMUSCULAR INJECTION**
  - Child 13–15 years: 0.5 mL for 1 dose, to be injected preferably into deltoid region

**Immunisation against Neisseria meningitidis in an unimmunised patient**
- **BY INTRAMUSCULAR INJECTION**
  - Child 10–17 years: 0.5 mL for 1 dose, booster dose is not required
Immunisation against *Neisseria meningitidis* in those at risk of exposure

- **BY INTRAMUSCULAR INJECTION**
  - Child 1-7 years: 0.5 mL for 1 dose, to be injected preferably into deltoid region (or anterolateral thigh in child 12-23 months), then 0.5 mL after 1 year if required for 1 dose, second dose should be considered in those who continue to be at risk of *Neisseria meningitidis* serogroup A infection

Patients attending university for the first time (who have not received the routine meningococcal A, C, W135, and Y conjugate vaccine over the age of 10 years)

- **BY INTRAMUSCULAR INJECTION**
  - Child 16-17 years: 0.5 mL for 1 dose

### UNLICENSED USE

**MENVEO®** Menveo® is not licensed for use in children under 2 years.

### SIDE-EFFECTS

- Rare Symptoms of meningitis reported (but no evidence that the vaccine causes meningococcal C meningitis)

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

- Menveo (GliaSinoSmithKline Ltd)
  - Menveo vaccine powder and solvent for solution for injection 0.5ml vials | 1 vial (P) £30.00
- Nimenrix (Pfizer Ltd)
  - Nimenrix vaccine powder and solvent for solution for injection 0.5ml pre-filled disposable injection (P) £30.00

---

**Pneumococcal polysaccharide conjugate vaccine (adsorbed)**

### INDICATIONS AND DOSE

**PREVENAR 13®**

**Primary immunisation against pneumococcal infection (first dose)**

- **BY INTRAMUSCULAR INJECTION**
  - Child 2 months: 0.5 mL for 1 dose, anterolateral thigh is preferred site of injection in infants

**Primary immunisation against pneumococcal infection (second dose)**

- **BY INTRAMUSCULAR INJECTION**
  - Child 4 months: 0.5 mL for 1 dose, anterolateral thigh is preferred site of injection in infants

**Primary immunisation against pneumococcal infection (booster dose)**

- **BY INTRAMUSCULAR INJECTION**
  - Child 12-13 months: 0.5 mL for 1 dose, anterolateral thigh is preferred site of injection in infants

Immunisation against pneumococcal infection (in patients who have not been vaccinated or not completed the primary course)

- **BY INTRAMUSCULAR INJECTION**
  - Child 12 months–4 years: 0.5 mL for 1 dose, deltoid muscle is preferred site of injection in young children; anterolateral thigh is preferred site in infants

Immunisation against pneumococcal infection, in immunocompromised or asplenic patients or patients with splenic dysfunction (who have not been vaccinated or not completed the primary course)

- **BY INTRAMUSCULAR INJECTION**
  - Child 12 months–4 years: 0.5 mL every 2 months for 2 doses, deltoid muscle is preferred site of injection in young children; anterolateral thigh is preferred site in infants

### SYNFLORIX®

Immunisation against pneumococcal infection

- **BY INTRAMUSCULAR INJECTION**
  - Child 6 weeks–4 years: Deltoid muscle is preferred site of injection in young children; anterolateral thigh is preferred site in infants (consult product literature)

### UNLICENSED USE

**PREVENAR 13®** The dose in BNF publications may differ from that in product literature.

### PRESCRIBING AND DISPENSING INFORMATION

**PREVENAR 13®** Available as part of childhood immunisation schedule from ImmForm [www.immform.dh.gov.uk](http://www.immform.dh.gov.uk).

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

- Prevenar (Pfizer Ltd)
  - Prevenar 13 vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (P) £49.10 | 10 pre-filled disposable injection (P) £491.00
- Synflorix (GliaSinoSmithKline UK Ltd)
  - Synflorix vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (P) £276.00

---

**Pneumococcal polysaccharide vaccine**

### INDICATIONS AND DOSE

Immunisation against pneumococcal infection

- **BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION**
  - Child 2-17 years: 0.5 mL for 1 dose

Immunisation in patients at increased risk of pneumococcal disease

- **BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION**
  - Child 2-4 years: 0.5 mL for 1 dose, dose should be administered after the second birthday or at least 2 months after the final dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed)
  - Child 5-17 years: 0.5 mL for 1 dose

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Pneumococcal polysaccharide vaccine (Non-proprietary)
  - Pneumococcal polysaccharide vaccine solution for injection 0.5ml vials | 1 vial (P) £8.32

---

**Typhoid vaccine**

### INDICATIONS AND DOSE

Immunisation against typhoid fever in children at high risk of typhoid fever

- **BY INTRAMUSCULAR INJECTION**
  - Child 12–23 months: 0.5 mL for 1 dose, dose should be given at least 2 weeks before potential exposure to typhoid infection, response may be suboptimal

Immunisation against typhoid fever

- **BY MOUTH**
  - Child 2-17 years: 0.5 mL for 1 dose, dose should be given at least 2 weeks before potential exposure to typhoid infection
  - Child 6-17 years: 1 capsule every 2 days for 3 doses (on days 1, 3, and 5)
Immunisation against hepatitis A and hepatitis B infection accelerated schedule for travellers departing within 1 month

- **BY INTRAMUSCULAR INJECTION**
  - Child 16–17 years: Initially 1 mL for 1 dose, then 0.5 mL after 6–12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders (but immune response may be reduced)

**VACCINES** > **VIRAL VACCINES**

**Hepatitis A and B vaccine**

The properties listed below are those particular to the combination only. For the properties of the components please consider, hepatitis A vaccine below, hepatitis B vaccine p. 765.

- **INDICATIONS AND DOSE**
  - **AMBIRIX®**
    - **Immunisation against hepatitis A and hepatitis B infection (primary course)**
      - **BY INTRAMUSCULAR INJECTION**
        - Child 1–15 years: Initially 1 mL for 1 dose, then 1 mL after 6–12 months for 1 dose, the deltoid region is the preferred site of injection in older children; anterolateral thigh is the preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)
        - **TWINRIX® ADULT**
          - **Immunisation against hepatitis A and hepatitis B infection (primary course)**
            - **BY INTRAMUSCULAR INJECTION**
              - Child 16–17 years: Initially 1 mL every month for 2 doses, then 0.5 mL after 5 months for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

**Hepatitis A vaccine**

- **INDICATIONS AND DOSE**
  - **AVAXIM®**
    - **Immunisation against hepatitis A infection**
      - **BY INTRAMUSCULAR INJECTION**
        - Child 16–17 years: Initially 0.5 mL for 1 dose, then 0.5 mL after 6–12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders; not to be injected into the buttock (vaccine efficacy reduced)
Hepatitis A with typhoid vaccine

The properties listed below are those particular to the combination only. For the properties of the components please consider, hepatitis A vaccine p. 764, typhoid vaccine p. 763.

**INDICATIONS AND DOSE**

**HEPATYRIX®**

Immunisation against hepatitis A and typhoid infection (primary course)

- **BY INTRAMUSCULAR INJECTION**
  - Child 15-17 years: 1 mL for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for patients with bleeding disorders, booster dose given using single component vaccines
Immunisation against hepatitis B infection, alternative accelerated schedule

- BY INTRAMUSCULAR INJECTION
- Child 11-15 years: 20 micrograms for 1 dose, followed by 20 micrograms after 6 months, this schedule is not suitable if high risk of infection between doses or if compliance with second dose uncertain, deltoid muscle is preferred site of injection; not to be injected into the buttoc (vaccine efficacy reduced)

Immunisation against hepatitis B infection (for neonates born to hepatitis B surface antigen positive mother)

- BY INTRAMUSCULAR INJECTION
- Neonate: 10 micrograms once a month for 3 doses, first dose to be given at birth with hepatitis B immunoglobulin injection (separate site), followed by 10 micrograms after 10 months for 1 dose, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced).

Immunisation against hepatitis B infection (in renal insufficiency, including haemodialysis patients)

- BY INTRAMUSCULAR INJECTION
- Neonate: 10 micrograms every month for 2 doses, followed by 10 micrograms after 5 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), this dose should not be given to neonates born to hepatitis B surface antigen positive mother.
- Child 1 month-15 years: 10 micrograms every month for 2 doses, followed by 10 micrograms after 5 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)
- Child 16-17 years: 40 micrograms every month for 3 doses, followed by 40 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (in renal insufficiency, including haemodialysis patients (accelerated schedule))

- BY INTRAMUSCULAR INJECTION
- Neonate: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), this dose should not be given to neonates born to hepatitis B surface antigen positive mother.
- Child 1 month-15 years: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)

FENDRIX®

Immunisation against hepatitis B infection in renal insufficiency (including pre-haemodialysis and haemodialysis patients)

- BY INTRAMUSCULAR INJECTION
- Child 15-17 years: 20 micrograms every month for 3 doses, followed by 20 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

HBVAXPRO®

Immunisation against hepatitis B infection

- BY INTRAMUSCULAR INJECTION
- Neonate: 5 micrograms for 1 dose, followed by 5 micrograms after 1 month for 1 dose, then 5 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, anterolateral thigh is preferred site of injection in neonates; not to be injected into the buttock (vaccine efficacy reduced), dose not to be used for neonate born to hepatitis B surface antigen positive mother.
- Child 1 month-15 years: 5 micrograms for 1 dose, followed by 5 micrograms after 1 month for 1 dose, then 5 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; anterolateral thigh is preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced)
- Child 16-17 years: 10 micrograms for 1 dose, followed by 10 micrograms after 1 month for 1 dose, then 10 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (accelerated schedule)

- BY INTRAMUSCULAR INJECTION
- Neonate: 5 micrograms every month for 3 doses, followed by 5 micrograms after 10 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), dose not to be used for neonate born to hepatitis B surface antigen positive mother.
- Child 1 month-15 years: 5 micrograms every month for 3 doses, followed by 5 micrograms after 10 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced)
- Child 16-17 years: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in older children; not to be injected into the buttock (vaccine efficacy reduced)
Neonate born to hepatitis B surface antigen-positive mother

- **BY INTRAMUSCULAR INJECTION**
  - Neonate: 5 micrograms every month for 3 doses, first dose given at birth with hepatitis B immunoglobulin injection (separate site), followed by 5 micrograms after 10 months for 1 dose, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced).

Chronic haemodialysis patients

- **BY INTRAMUSCULAR INJECTION**
  - Child 16-17 years: 40 micrograms every month for 2 doses, followed by 40 micrograms after 5 months for 1 dose, booster doses may be required in those with low antibody concentration, deltoid muscle is preferred site of injection in older children; not to be injected into the buttock (vaccine efficacy reduced).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

**EXCIPIENTS:** May contain Thiomersal

- **Engerix B** (GlaxoSmithKline UK Ltd)
  - Hepatitis B virus surface antigen 20 microgram per 1 ml Engerix B 20micrograms/1ml vaccine suspension for injection vials | 1 vial [Poten] £12.34 | 10 vial [Poten] £123.41
  - Hepatitis B 10micrograms/0.5ml vaccine suspension for injection pre-filled syringes | 1 pre-filled disposable injection [Poten] £5.97

- **Fendrix** (GlaxoSmithKline UK Ltd)
  - Hepatitis B virus surface antigen 40 microgram per 1 ml Fendrix 20micrograms/0.5ml vaccine suspension for injection pre-filled syringes | 1 pre-filled disposable injection [Poten] £8.10

- **HBVAXPRO** (Merck Sharp & Dohme Ltd)
  - Hepatitis B virus surface antigen 10 microgram per 1 ml HBVAXPRO 10micrograms/1ml vaccine suspension for injection pre-filled syringes | 1 pre-filled disposable injection [Poten] £2.40
  - Hepatitis B virus surface antigen 40 microgram per 1 ml HBVAXPRO 40micrograms/1ml vaccine suspension for injection vials | 1 vial [Poten] £27.60

**GARDASIL®**

Prevention of premalignant genital (cervical, vulvar and vaginal) and anal lesions, cervical and anal cancers, and genital warts

- **BY INTRAMUSCULAR INJECTION**
  - Child 9-14 years (female): 0.5 mL for 1 dose, followed by 0.5 mL after 6 months for 1 dose, if the second dose is administered earlier than 6 months after the first dose, a third dose should be administered, dose to be administered preferably into deltoid region or higher anterolateral thigh, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the girl is then aged 15 years or more.
  - Child 15-17 years (female): 0.5 mL for 1 dose, followed by 0.5 mL after 1–2.5 months for 1 dose, then 0.5 mL after 5–12 months from the first dose for 1 dose, dose to be administered into deltoid region, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.

- **UNLICENSED USE**
  - **GARDASIL®** Two dose schedule not licensed for use in girls aged 14 years.

- **PREGNANCY** Not known to be harmful, but vaccination should be postponed until completion of pregnancy.

- **PRESCRIBING AND DISPENSING INFORMATION** To avoid confusion, prescribers should specify the brand to be dispensed.

**Human papillomavirus vaccines**

02-Mar-2017

- **INDICATIONS AND DOSE**
  - **CERVARIX®**
    - Prevention of premalignant genital lesions and cervical cancer
      - **BY INTRAMUSCULAR INJECTION**
        - Child 9-14 years (female): 0.5 mL for 1 dose, followed by 0.5 mL after 5–7 months for 1 dose, if second dose administered earlier than 5 months after the first, a third dose should be administered, dose to be administered into deltoid region, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the girl is then aged 15 years or more.
        - Child 15-17 years (female): 0.5 mL for 1 dose, followed by 0.5 mL after 1–2.5 months for 1 dose, then 0.5 mL after 5–12 months from the first dose for 1 dose, dose to be administered into deltoid region, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.

- **INFLUENZA VACCINE**

  - **INDICATIONS AND DOSE**
    - Annual immunisation against seasonal influenza
      - **BY INTRAMUSCULAR INJECTION**
        - Child 6 months-17 years: 0.5 mL for 1 dose
      - **BY INTRanasAL ADMINISTRATION**
        - Child 2-17 years: 0.1 mL for 1 dose, dose to be administered into each nostril
Annual immunisation against seasonal influenza (for children who have not received seasonal influenza vaccine previously)
- By INTRAMUSCULAR INJECTION
  - Child 6 months–9 years: 0.5 mL for 1 dose, followed by 0.5 mL for 1 dose, after at least 4 weeks
  - By INTRanasAL ADMINISTRATION
  - Child 2–9 years: 0.1 mL for 1 dose, followed by 0.1 mL for 1 dose, after at least 4 weeks. 0.1 mL dose to be administered to each nostril

- **UNLICENSED USE** Some products containing inactivated influenza vaccine (surface antigen) are not licensed for use in children under 4 years—check product literature.

- **FLUVIRIN®** Not licensed for use in children under 4 years.
- **FLUARIX TETRA®** Not licensed for use in children under 3 years of age.
- **OPTAFLU®** Not licensed for use in children and adolescents under 18 years.
- **CONTRA-INDICATIONS** Preparations marketed by Pfizer, or CSL Biotherapies in child under 5 years—increased risk of febrile convulsions.

- **FLUENZ TETRA®** Active wheezing · concomitant use with antiviral therapy for influenza · concomitant use with salicylates · severe asthma.

- **CONTRA-INDICATIONS, FURTHER INFORMATION**
  - Concomitant use with antivirals Avoid antivirals for at least 2 weeks after immunisation; avoid immunisation for at least 48 hours after stopping the antiviral.

- **ENZIRA®** Child under 5 years—a increased risk of febrile convulsions.

- **CAUTIONS** Increased risk of fever in child 5–9 years with preparations marketed by Pfizer or CSL Biotherapies—use alternative influenza vaccine if available.

- **ENZIRA®** Child 5–9 years (increased risk of fever)—use alternative influenza vaccine if available.

- **INTERACTIONS** Appendix 1: live vaccines.

- **SIDE-EFFECTS**
  - General SIDE-EFFECTS
  - Uncommon Epistaxis
  - Frequency not known Febrele convulsions · transient thrombocytopenia

  - **SPECIFIC SIDE-EFFECTS**
    - With intranasal use Rhinorrhea.

- **ALLERGY AND CROSS-SENSITIVITY** Individuals with a history of egg allergy can be immunised with either an egg free influenza vaccine, if available, or an influenza vaccine with an ovalbumin content less than 120 nanograms/mL (facilities should be available to treat anaphylaxis).

  - Vaccines with an ovalbumin content more than 120 nanograms/mL or where content is not stated should not be used in individuals with egg allergy. If an influenza vaccine containing ovalbumin is being considered in those with a history of anaphylaxis to egg or egg allergy with uncontrolled asthma, these individuals should be referred to a specialist in hospital.

- **PREGNANCY** Inactivated vaccines not known to be harmful.

- **FLUENZ TETRA®** Avoid in pregnancy.

- **BREAST FEEDING** Inactivated vaccines not known to be harmful.

- **FLUENZ TETRA®** Avoid in breast-feeding.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - **FLUARIX TETRA®** Ovalbumin content less than 100 nanograms/mL.

- **PATIENT AND CARER ADVICE**
  - **FLUENZ TETRA®** Avoid close contact with severely immunocompromised patients for 1–2 weeks after vaccination.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Spray**
    - **EXCIPIENTS:** May contain Gelatin, gentamicin.
      - **FLUARIX TETRA®** Flumist Quadrivalent (AstraZeneca UK Ltd)
        - Flumist Quadrivalent vaccine nasal suspension 0.2ml unit dose | 10 unit dose (POM) £180.00
      - **FLUENZ TETRA®** Fluenz Tetra vaccine nasal suspension 0.2ml unit dose | 10 unit dose (POM) £180.00

  - **Suspension for injection**
    - **EXCIPIENTS:** May contain Gentamicin, kanamycin, neomycin penicillins, polymyxin b, thiomersal.
      - **FLUENZ TETRA®** Influenza vaccine (Non-proprietary)
        - Influenza vaccine (split virion, inactivated) suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (POM) £5.00–£6.59 | 10 pre-filled disposable injection (POM) £65.90
      - **Agrippal (Seqirus Ltd)**
        - Agrippal vaccine suspension for injection 0.5ml pre-filled syringes | 10 pre-filled disposable injection (POM) £58.50
      - **Enzira (Pfizer Ltd)**
        - Enzira vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (POM) £5.15 | 10 pre-filled disposable injection (POM) £52.50
      - **Fluarix Tetra (GlaxoSmithKline UK Ltd)**
        - Fluarix Tetra vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (POM) £9.94 | 10 pre-filled disposable injection (POM) £99.40
      - **Imuvac (BGP Products Ltd)**
        - Imvac vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (POM) £6.59 | 10 pre-filled disposable injection (POM) £65.90
      - **Influvac Sub-unit (BGP Products Ltd)**
        - Influvac Sub-unit vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (POM) £5.22 | 10 pre-filled disposable injection (POM) £52.20
      - **Intanza (Sanofi pasteur MSD Ltd)**
        - Intanza 15microgram strain vaccine suspension for injection 0.1ml pre-filled syringes | 1 pre-filled disposable injection (POM) £9.05 | 10 pre-filled disposable injection (POM) £90.50

---

**Japanese encephalitis vaccine**

**INDICATIONS AND DOSE**

**Immunisation against Japanese encephalitis**

- **BY INTRAMUSCULAR INJECTION**
  - Child 2 months–2 years: 0.25 mL every 28 days for 2 doses, anterolateral thigh is preferred site of injection in infants, the subcutaneous route may be used for patients with bleeding disorders
  - Child 3–17 years: 0.5 mL every 28 days for 2 doses, deltoid muscle is preferred site in older children; anterolateral thigh is preferred in infants, the subcutaneous route may be used for patients with bleeding disorders

**SIDE-EFFECTS**

- Uncommon Cough

**PREGNANCY** Although manufacturer advises avoid because of limited information, miscarriage has been associated with Japanese encephalitis virus infection acquired during the first 2 trimesters of pregnancy.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Japanese encephalitis vaccine (Non-proprietary)**
  - Japanese encephalitis GCV vaccine solution for injection 1ml vials | 1 vial no price available
Measles, mumps and rubella vaccine, live

**INDICATIONS AND DOSE**

**Primary immunisation against measles, mumps, and rubella (first dose)**
- **BY INTRAMUSCULAR INJECTION, OR BY DEEP SUBCUTANEOUS INJECTION**
  - Child 12-13 months: 0.5 mL for 1 dose

**Primary immunisation against measles, mumps, and rubella (second dose)**
- **BY INTRAMUSCULAR INJECTION, OR BY DEEP SUBCUTANEOUS INJECTION**
  - Child 40 months-5 years: 0.5 mL for 1 dose

**Rubella immunisation (in seronegative women, susceptible to rubella and in unimmunised, seronegative women, post-partum)**
- **BY INTRAMUSCULAR INJECTION, OR BY DEEP SUBCUTANEOUS INJECTION**
  - Females of childbearing potential: (consult product literature or local protocols)

*Children presenting for pre-school booster, who have not received the primary immunisation (first dose)*

Immunisation for patients at school-leaving age or at entry into further education, who have not completed the primary immunisation course | Control of measles outbreak | Immunisation for patients travelling to areas where measles is endemic or epidemic, who have not completed the primary immunisation
- **BY INTRAMUSCULAR INJECTION, OR BY DEEP SUBCUTANEOUS INJECTION**
  - Child 6 months-17 years: (consult product literature or local protocols)

**UNLICENSED USE** Not licensed for use in children under 9 months.

**IMPORTANT SAFETY INFORMATION**

**MMR VACCINATION AND BOWEL DISEASE OR AUTISM**

Reviews undertaken on behalf of the CSM, the Medical Research Council, and the Cochrane Collaboration, have not found any evidence of a link between MMR vaccination and bowel disease or autism. The Chief Medical Officers have advised that the MMR vaccine is the safest and best way to protect children against measles, mumps, and rubella. Information (including fact sheets and a list of references) may be obtained from www.dh.gov.uk/immunisation.

**CAUTIONS** Antibody response to measles component may be reduced after immunoglobulin administration or blood transfusion – leave an interval of at least 3 months before MMR immunisation

**CAUTIONS, FURTHER INFORMATION**

- Administration with other vaccines MMR vaccine should not be administered on the same day as yellow fever vaccine; there should be a 4-week minimum interval between the vaccines. When protection is rapidly required, the vaccines can be given at any interval and an additional dose of MMR may be considered.
- MMR and varicella-zoster vaccine can be given on the same day or separated by a 4-week minimum interval.

When protection is rapidly required, the vaccines can be given at any interval and an additional dose of the vaccine given second may be considered.

**INTERACTIONS** → Appendix 1: live vaccines

**SIDE-EFFECTS**

- **Uncommon** Parotid swelling (usually in the third week) - sleep disturbances - unusual crying in infants
- **Rare** Arthropathy (2 to 3 weeks after immunisation) - idiopathic thrombocytopenic purpura
- **Frequency not known** Optic neuritis - peripheral neuritis

**SIDE-EFFECTS, FURTHER INFORMATION**

Malaise, fever, or a rash can occur after the first dose of MMR vaccine – most commonly about a week after vaccination and lasting about 2 to 3 days. Leaflets are available for parents on advice for reducing fever (including the use of paracetamol).

- Febrile seizures – occur rarely 6 to 11 days after MMR vaccination (the incidence is lower than that following measles infection)
- Idiopathic thrombocytopenic purpura Idiopathic thrombocytopenic purpura has occurred rarely following MMR vaccination, usually within 6 weeks of the first dose. The risk of idiopathic thrombocytopenic purpura following MMR vaccine is much less than the risk after infection with wild measles or rubella virus. Children who develop idiopathic thrombocytopenic purpura within 6 weeks of the first dose of MMR should undergo serological testing before the second dose is due; if the results suggest incomplete immunity against measles, mumps or rubella then a second dose of MMR is recommended. The Specialist and Reference Microbiology Division, Health Protection Agency offers free serological testing for children who develop idiopathic thrombocytopenic purpura within 6 weeks of the first dose of MMR.
- Aseptic meningitis Post-vaccination aseptic meningitis was reported (rarely and with complete recovery) following vaccination with MMR vaccine containing Urabe mumps vaccine, which has now been discontinued; no cases have been confirmed in association with the currently used Jeryl Lynn mumps vaccine. Children with post-vaccination symptoms are not infectious.

**Frequency of side effects** Adverse reactions are considerably less frequent after the second dose of MMR vaccine than after the first.

**ALLERGY AND CROSS-SENSITIVITY** MMR vaccine can be given safely even when the child has had an anaphylactic reaction to food containing egg. Dislike of eggs, refusal to eat egg, or confirmed anaphylactic reactions to egg-containing food is not a contra-indication to MMR vaccination. Children with a confirmed anaphylactic reaction to the MMR vaccine should be assessed by a specialist.

**CONCEPTION AND CONTRACEPTION** Exclude pregnancy before immunisation. Avoid pregnancy for at least 1 month after vaccination.

**PRESCRIBING AND DISPENSING INFORMATION** Available as part of childhood immunisation schedule from health organisations or ImmForm www.immform.dh.gov.uk.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for suspension for injection**

EXCipients: May contain Gelatin, neomycin
- **M-M-RVAXPRO** (Merck Sharp & Dohme Ltd)
  - M-M-RVAXPRO vaccine powder and solvent for suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection | £11.00

**Powder and solvent for solution for injection**

EXCipients: May contain Neomycin
- **Priorix** (GlaxoSmithKline UK Ltd)
  - Priorix vaccine powder and solvent for solution for injection 0.5ml vials | 1 vial | £7.64
Rabies vaccine

**INDICATIONS AND DOSE**

Pre-exposure prophylaxis

- **BY INTRAMUSCULAR INJECTION**
  - Child: 1 mL for 1 dose, to be given 10 years after primary course is completed, administered in deltoid region or anterolateral thigh in infants, for those at continuous risk, measure plasma-concentration of antirabies antibodies every 6 months and give a booster dose if the titre is less than 0.5 units/mL, final dose may be given from day 21, if insufficient time before travel

Pre-exposure prophylaxis booster dose (for patients at frequent risk of exposure)

- **BY INTRAMUSCULAR INJECTION**
  - Child: 1 mL after 1 year for 1 dose, to be given 1 year after primary course is completed, then 1 mL every 3–5 years, to be administered in deltoid region or anterolateral thigh in infants, the frequency of booster doses may alternatively be determined according to plasma-concentration of antirabies antibodies

Post-exposure prophylaxis of fully immunised individuals (who have previously received pre-exposure or post-exposure prophylaxis with cell-derived rabies vaccine)

- **BY INTRAMUSCULAR INJECTION**
  - Child (administered on expert advice): 1 mL for 1 dose, followed by 1 mL after 3–7 days for 1 dose, to be administered in deltoid region or anterolateral thigh in infants, rabies immunoglobulin is not necessary

Post-exposure treatment for unimmunised individuals (or those whose prophylaxis is possibly incomplete)

- **BY INTRAMUSCULAR INJECTION**
  - Child (administered on expert advice): 1 mL 5 times a month for 1 month, doses should be given on days 0, 3, 7, 14, and the fifth dose is given between day 28–30, to be administered in deltoid region or anterolateral thigh in infants, depending on the level of risk (determined by factors such as the nature of the bite and the country where it was sustained), rabies immunoglobulin is given to unimmunised individuals on day 0 or within 7 days of starting the course of rabies vaccine, the immunisation course can be discontinued if it is proved that the individual was not at risk

**INTERACTIONS** → Appendix 1: rabies vaccine

**SIDE-EFFECTS** Paresis

**PREGNANCY** Because of the potential consequences of untreated rabies exposure and because rabies vaccination has not been associated with fetal abnormalities, pregnancy is not considered a contra-indication to post-exposure prophylaxis. Immunisation against rabies is indicated during pregnancy if there is substantial risk of exposure to rabies and rapid access to post-exposure prophylaxis is likely to be limited.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for suspension for injection**

EXCIPIENTS: May contain Neomycin

- Rabies vaccine (Non-proprietary) Verorab powder and solvent for suspension for injection 0.5mL vials 1 vial £40.84

- Rabipur (GlanzSmithKline UK Ltd) Rabipur vaccine powder and solvent for solution for injection 1mL vials 1 vial £34.56

- Rabipur vaccine powder and solvent for solution for injection 1mL pre-filled syringes 1 pre-filled disposable injection £34.56

Rotavirus vaccine

**INDICATIONS AND DOSE**

Immunisation against gastro-enteritis caused by rotavirus

- **BY MOUTH**
  - Child 6–23 weeks: 1.5 mL for 2 doses separated by an interval of at least 4 weeks, first dose must be given between 6–14 weeks of age; course should be completed before 24 weeks of age (preferably before 16 weeks)

**CONTRA-INDICATIONS** History of intussusception · predisposition to intussusception · severe combined immunosuppression

**CONTRA-INDICATIONS, FURTHER INFORMATION**

- Immunosuppression With the exception of severe combined immunodeficiency, rotavirus vaccine is not contra-indicated in immunosuppressed patients—benefit from vaccination is likely to outweigh the risk, if there is any doubt, seek specialist advice.

- **CAUTIONS** Diarrhoea (postpone vaccination) · immunosuppressed close contacts · vomiting (postpone vaccination)

**CAUTIONS, FURTHER INFORMATION**

The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; however, vaccination of those with immunosuppressed close contacts may protect the contacts from wild-type rotavirus disease and outweigh any risk from transmission of vaccine virus.

**INTERACTIONS** → Appendix 1: live vaccines

**SIDE-EFFECTS** Abdominal cramps · abdominal pain · diarrhoea · nausea · vomiting

**PATIENT AND CARER ADVICE** The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; carers of a recently vaccinated baby should be advised of the need to wash their hands after changing the baby’s nappies.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Oral suspension**

- Rotarix (GlanzSmithKline UK Ltd) Rotarix vaccine live oral suspension 1.5mL pre-filled syringes 1 unit dose £34.76

Tick-borne encephalitis vaccine, inactivated

**INDICATIONS AND DOSE**

Initial immunisation against tick-borne encephalitis

- **BY INTRAMUSCULAR INJECTION**
  - Child 1–15 years: 0.25 mL for 1 dose, followed by 0.25 mL after 1–3 months for 1 dose, then 0.25 mL after further 5–12 months for 1 dose, to achieve more rapid
CAUTIONS, FURTHER INFORMATION

Rarely, the varicella–zoster vaccine virus has been transmitted from the vaccinated individual to close contacts. Therefore, contact with the following should be avoided if a vaccine-related cutaneous rash develops within 4–6 weeks of the first or second dose:

- varicella–susceptible pregnant women;
- individuals at high risk of severe varicella, including those with immunodeficiency or those receiving immunosuppressive therapy.

Healthcare workers who develop a generalised papular or vesicular rash on vaccination should avoid contact with patients until the lesions have crusted. Those who develop a localised rash after vaccination should cover the lesions and be allowed to continue working unless in contact with patients at high risk of severe varicella.

- Administration with MMR vaccine: Varicella–zoster and MMR vaccines can be given on the same day or separated by a 4-week minimum interval. When protection is rapidly required, the vaccines can be given at any interval and an additional dose of the vaccine given second may be considered.

- INTERACTIONS → Appendix 1: live vaccines

- SIDE-EFFECTS

- Rare: Thrombocytopenia
- Frequency not known: Conjunctivitis · varicella-like rash

- CONCESSION AND CONTRA-INDICATIONS

- Avoid pregnancy for 3 months after vaccination.

- PRESCRIBING AND DISPENSING INFORMATION

- ZOSTAVAX®: Advice in BNF Publications may differ from that in product literature.

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

- Powder and solvent for suspension for injection

EXCIPIENTS: May contain Gelatin, neomycin
- Varilrix (GlaxoSmithKline UK Ltd)
  Varilrix vaccine powder and solvent for solution for injection 0.5ml vials | 1 vial (PSt) £27.31

- Powder and solvent for solution for injection

EXCIPIENTS: May contain Neomycin
- Varilrix (GlaxoSmithKline UK Ltd)
  Varilrix vaccine powder and solvent for solution for injection 0.5ml vials | 1 vial (PSt) £30.28

- Yellow fever vaccine, live

- INDICATIONS AND DOSE

Immunisation against yellow fever

- BY DEEP SUBCUTANEOUS INJECTION

- Child 6–8 months (administered on expert advice): Infants under 9 months should be vaccinated only if the risk of yellow fever is high and unavoidable (consult product literature or local protocols)

- Child 9 months–17 years: 0.5 ml for 1 dose

- CONTRA-INDICATIONS

Children under 6 months · history of thymus dysfunction

- CAUTIONS

- CAUTIONS, FURTHER INFORMATION

- Administration with MMR vaccine: Yellow fever and MMR vaccines should not be administered on the same day; there should be a 4-week minimum interval between the vaccines. When protection is rapidly required, the vaccines can be given at any interval and an additional dose of MMR may be considered.

- INTERACTIONS → Appendix 1: live vaccines

- SIDE-EFFECTS

Neurotropic disease · viscerotropic disease
SIDE-EFFECTS, FURTHER INFORMATION

- Vaccine-associated adverse effects  Very rare adverse effects, such as viscerotropic disease (yellow-fever vaccine-associated viscerotropic disease, YEL-AVD), a syndrome which may include metabolic acidosis, muscle and liver cirrhosis, and multi-organ failure. Neurological disorders (yellow fever vaccine-associated neurotropic disease, YEL-AND) such as encephalitis have also been reported. These very rare adverse effects usually occur after the first dose of yellow fever vaccine in those with no previous immunity.

- ALLERGY AND CROSS-SENSITIVITY  Yellow fever vaccine should only be considered under the guidance of a specialist in individuals with evidence of previous anaphylactic reaction to egg.

- PREGNANCY  Live yellow fever vaccine should not be given during pregnancy because there is a theoretical risk of fetal infection. Pregnant women should be advised not to travel to areas at high risk of yellow fever. If exposure cannot be avoided during pregnancy, then the vaccine should be given if the risk from disease in the mother outweighs the risk to the fetus from vaccination.

- BREAST FEEDING  Avoid; seek specialist advice if exposure to virus cannot be avoided.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

  Powder and solvent for suspension for injection

  - Stamaril (sanofi pasteur MSD Ltd)
    Stamaril vaccine powder and solvent for suspension for injection 0.5ml vials | 1 vial | £33.10
Chapter 15
Anaesthesia

General anaesthesia

Overview
Several different types of drug are given together during general anaesthesia. Anaesthesia is induced with either a volatile drug given by inhalation or with an intravenously administered drug; anaesthesia is maintained with an intravenous or inhalational anaesthetic. Analgesics, usually short-acting opioids, are also used. The use of neuromuscular blocking drugs necessitates intermittent positive-pressure ventilation. Following surgery, anticholinesterases can be given to reverse the effects of neuromuscular blocking drugs; specific antagonists can be used to reverse central and respiratory depression caused by some drugs used in surgery. A local topical anaesthetic can be used to reduce pain at the injection site.

Individual requirements vary considerably and the recommended doses are only a guide. Smaller doses are indicated in ill, shocked, or debilitated children and in significant hepatic impairment, while robust individuals may require larger doses. The required dose of induction agent may be less if the patient has been premedicated with a sedative agent or if an opioid analgesic has been used.

Intravenous anaesthetics
Intravenous anaesthetics may be used either to induce anaesthesia or for maintenance of anaesthesia throughout surgery. Intravenous anaesthetics nearly all produce their effect in one arm-brain circulation time. Extreme care is required in surgery of the mouth, pharynx, or larynx where the airway may be difficult to maintain (e.g. in the presence of a tumour in the pharynx or larynx).

To facilitate tracheal intubation, induction is usually followed by a neuromuscular blocking drug or a short-acting opioid.

The doses of all intravenous anaesthetic drugs should be titrated to effect (except when using ‘rapid sequence induction’).

Total intravenous anaesthesia
This is a technique in which major surgery is carried out with all drugs given intravenously. Respiration can be spontaneous, or controlled with oxygen-enriched air. Neuromuscular blocking drugs can be used to provide relaxation and prevent reflex muscle movements. The main problem to be overcome is the assessment of depth of anaesthesia. Target Controlled Infusion (TCI) systems can be used to titrate intravenous anaesthetic infusions to predicted plasma-drug concentrations; specific models with paediatric pharmacokinetic data should be used for children.

Drugs used for intravenous anaesthesia
Propofol p. 775, the most widely used intravenous anaesthetic, can be used for induction or maintenance of anaesthesia in children, but it is not commonly used in neonates. Propofol is associated with rapid recovery and less hangover effect than other intravenous anaesthetics. Propofol can also be used for sedation during diagnostic procedures.

Thiopental sodium p. 214 is a barbiturate that is used for induction of anaesthesia, but has no analgesic properties. Induction is generally smooth and rapid, but dose-related cardiovascular and respiratory depression can occur. Awakening from a moderate dose of thiopental sodium is rapid because the drug redistributes into other tissues, particularly fat. However, metabolism is slow and sedative effects can persist for 24 hours. Repeated doses have a cumulative effect particularly in neonates and recovery is much slower.

Etomidate p. 774 is an intravenous agent associated with rapid recovery without a hangover effect. Etomidate causes less hypotension than thiopental sodium and propofol during induction. It produces a high incidence of extraneous muscle movements, which can be minimised by an opioid analgesic or a short-acting benzodiazepine given just before induction.

Ketamine p. 790 causes less hypotension than thiopental sodium and propofol during induction. It is sometimes used in children requiring repeat anaesthesia (such as for serial burns dressings), however recovery is relatively slow and there is a high incidence of extraneous muscle movements. Ketamine can cause hallucinations, nightmares, and other transient psychotic effects; these can be reduced by a benzodiazepine such as diazepam p. 212 or midazolam p. 215.

Inhalational anaesthetics
Inhalational anaesthetics include gases and volatile liquids. Gaseous anaesthetics require suitable equipment for storage and administration. Volatile liquid anaesthetics are administered using calibrated vaporisers, using air, oxygen, or nitrous oxide–oxygen mixtures as the carrier gas. To prevent hypoxia, the inspired gas mixture should contain a minimum of 25% oxygen at all times. Higher concentrations of oxygen (greater than 30%) are usually required during inhalational anaesthesia when nitrous oxide p. 777 is being administered.

Volatile liquid anaesthetics
Volatile liquid anaesthetics can be used for induction and maintenance of anaesthesia, and following induction with an intravenous anaesthetic.

Isoflurane p. 777 is a volatile liquid anaesthetic. Heart rhythm is generally stable during isoflurane anaesthesia, but heart-rate can rise. Systemic arterial pressure and cardiac
output can fall, owing to a decrease in systemic vascular resistance. Muscle relaxation occurs and the effects of muscle relaxant drugs are potentiated. Isoflurane is not recommended for induction of anaesthesia in infants and children of all ages because of the occurrence of cough, breath-holding, desaturation, increased secretions, and laryngospasm. Isoflurane is the preferred inhalational anaesthetic for use in obstetrics.

Desflurane p. 777 is a rapid acting volatile liquid anaesthetic; it is reported to have about one-fifth the potency of isoflurane. Emergence and recovery from anaesthesia are particularly rapid because of its low solubility. Desflurane is not recommended for induction of anaesthesia as it is irritant to the upper respiratory tract.

Sevoflurane p. 778 is a rapid acting volatile liquid anaesthetic and is more potent than desflurane. Emergence and recovery are particularly rapid, but slower than desflurane. Sevoflurane is non-irritant and is therefore often used for inhalational induction of anaesthesia.

Nitrous oxide
Nitrous oxide is used for maintenance of anaesthesia and, in sub-anaesthetic concentrations, for analgesia. For anaesthesia, it is commonly used in a concentration of 50 to 66% in oxygen as part of a balanced technique in association with other inhalational or intravenous agents. Nitrous oxide is unsatisfactory as a sole anaesthetic owing to lack of potency, but is useful as part of a combination of drugs since it allows a significant reduction in dosage.

For analgesia (without loss of consciousness), a mixture of nitrous oxide and oxygen containing 50% of each gas (Entonox®; Equanox®) is used. Self-administration using a demand valve may be used in children who are able to self-regulate their intake (usually over 5 years of age) for painful dressing changes, as an aid to postoperative physiotherapy, for wound debridement and in emergency ambulances.

Nitrous oxide may have a deleterious effect if used in children with an air-containing closed space since nitrous oxide diffuses into such a space with a resulting increase in pressure. This effect may be dangerous in conditions such as pneumothorax, which may enlarge to compromise respiration, or in the presence of intracranial air after head injury, entrapped air following recent underwater dive, or recent intra-ocular gas injection.

Malignant hyperthermia
Malignant hyperthermia is a rare but potentially lethal complication of anaesthesia. It is characterised by a rapid rise in temperature, increased muscle rigidity, tachycardia, and acidosis. The most common triggers of malignant hyperthermia are the volatile anaesthetics. Suxamethonium chloride p. 782 has also been implicated, but malignant hyperthermia is more likely if it is given following a volatile anaesthetic. Volatile anaesthetics and suxamethonium chloride should be avoided during anaesthesia in children at high risk of malignant hyperthermia.

Dantrolene sodium p. 791 is used in the treatment of malignant hyperthermia.

Sedation, anaesthesia, and resuscitation in dental practice
Overview
Sedation for dental procedures should be limited to conscious sedation whenever possible. Nitrous oxide p. 777 alone and midazolam p. 215 are effective for many children.

Surgery and long-term medication
Overview
The risk of losing disease control on stopping long-term medication before surgery is often greater than the risk posed by continuing it during surgery. It is vital that the anaesthetist knows about all drugs that a patient is (or has been) taking.

Patients with adrenal atrophy resulting from long-term corticosteroid use may suffer a precipitous fall in blood pressure unless corticosteroid cover is provided during anaesthesia and in the immediate postoperative period. Anaesthetists must therefore know whether a patient is, or has been, receiving corticosteroids (including high-dose inhaled corticosteroids).

Other drugs that should normally not be stopped before surgery include drugs for epilepsy, asthma, immunosuppression, and metabolic, endocrine and cardiovascular disorders (but see potassium sparing diuretics). Expert advice is required for children receiving antivirals for HIV infection. See general advice on surgery in children with diabetes in Diabetes, surgery and medical illness p. 429.

Children taking antiplatelet medication or an oral anticoagulant present an increased risk for surgery. In these circumstances, the anaesthetist and surgeon should assess the relative risks and decide jointly whether the antiplatelet or the anticoagulant drug should be stopped or replaced with heparin (unfractionated) p. 92 or low molecular weight heparin therapy.

Drugs that should be stopped before surgery include combined oral contraceptives, see Contraceptives, hormonal p. 472. If antidepressants need to be stopped, they should be withdrawn gradually to avoid withdrawal symptoms. Tricyclic antidepressants need not be stopped, but there may be an increased risk of arrhythmias and hypotension (and dangerous interactions with vasopressor drugs); therefore, the anaesthetist should be informed if they are not stopped. Lithium should be stopped 24 hours before major surgery but the normal dose can be continued for minor surgery (with careful monitoring of fluids and electrolytes). Potassium-sparing diuretics may need to be withheld on the morning of surgery because hyperkalaemia may develop if renal perfusion is impaired or if there is tissue damage. Herbal medicines may be associated with adverse effects when given with anaesthetic drugs and consideration should be given to stopping them before surgery.

ANAESTHETICS, GENERAL › INTRAVENOUS ANAESTHETICS

Etomidate
• INDICATIONS AND DOSE
Induction of anaesthesia
› BY SLOW INTRAVENOUS INJECTION
  › Child 1 month–14 years: 150–300 micrograms/kg (max. per dose 60 mg), to be administered over 30–60 seconds (60 seconds for children in whom hypotension might be hazardous), increased if necessary to 400 micrograms/kg.
  › Child 15–17 years: 150–300 micrograms/kg (max. per dose 60 mg), to be administered over 30–60 seconds (60 seconds for children in whom hypotension might be hazardous)
Hypnomidate

Acute circulatory failure (shock) (Janssen-Cilag Ltd)

Child 17 years:

Pain on injection

775

Child 1 month

(B.Braun Medical Ltd)

Child 17 years:

May depress neonatal respiration if used

Child 3

PATIENT AND CARER ADVICE

BREAST FEEDING

▶ May depress neonatal respiration if used during delivery.

SIDE-EFFECTS

Common or very common Apnoea, hyperventilation, hypotension, nausea, rash, stridor, vomiting

Uncommon Arrhythmias, bradycardia, cough, hiccup, hyperventilation, hypotension, phlebitis

Frequency not known AV block, cardiac arrest, extraneous muscle movement (high incidence), pain on injection, respiratory depression, seizures, shivering, Stevens-Johnson syndrome

SIDE-EFFECTS, FURTHER INFORMATION

Pregnancy

May depress neonatal respiration as soon as mother has recovered sufficiently from anaesthesia.

Hypnomidate

Acute circulatory failure (shock) - acute porphyrias p. 577 (avoid) - adrenal insufficiency - cardiovascular disease - fixed cardiac output - hypovolaemia

CAUTIONS, FURTHER INFORMATION

Adrenal insufficiency Etomidate suppresses adrenocortical function, particularly during continuous administration, and it should not be used for maintenance of anaesthesia. It should be used with caution in patients with underlying adrenal insufficiency, for example, those with sepsis.

INTERACTIONS

Appendix 1: etomidate

INDICATIONS AND DOSE

Induction of anaesthesia using 0.5% or 1% injection

▶ By slow intravenous injection, or by intravenous infusion

Child 1 month-16 years: Usual dose 2.5–4 mg/kg, dose adjusted according to age, body-weight and response

Child 17 years: Usual dose 1.5–2.5 mg/kg, to be administered at a rate of 20–40 mg every 10 seconds until response

Induction of anaesthesia using 2% injection

▶ By intravenous infusion

Child 3–16 years: Usual dose 2.5–4 mg/kg, dose adjusted according to age, body-weight and response

Child 17 years: Usual dose 1.5–2.5 mg/kg, to be administered at a rate of 20–40 mg every 10 seconds until response

Maintenance of anaesthesia using 1% injection

▶ By continuous intravenous infusion

Child 1 month-16 years: Usual dose 9–15 mg/kg/hour, dose adjusted according to age, body-weight and response

Child 17 years: Usual dose 4–12 mg/kg/hour, adjusted according to response

Maintenance of anaesthesia using 2% injection

▶ By continuous intravenous infusion

Child 3–16 years: Usual dose 9–15 mg/kg/hour, dose adjusted according to age, body-weight and response

Child 17 years: Usual dose 4–12 mg/kg/hour, adjusted according to response

Sedation of ventilated patients in intensive care using 1% or 2% injection

▶ By continuous intravenous infusion

Child 16–17 years: Usual dose 0.3–4 mg/kg/hour, adjusted according to response

Induction of sedation for surgical and diagnostic procedures using 0.5% or 1% injection

▶ By slow intravenous injection

Child 1 month-16 years: Initially 1–2 mg/kg, dose and rate of administration adjusted according to desired level of sedation and response

Child 17 years: Initially 0.5–1 mg/kg, to be administered over 1–5 minutes, dose and rate of administration adjusted according to desired level of sedation and response

Maintenance of sedation for surgical and diagnostic procedures using 0.5% injection

▶ Initially by intravenous infusion

Child 17 years: Initially 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response, followed by (by slow intravenous injection) 10–20 mg, (if rapid increase in sedation required)

Maintenance of sedation for surgical and diagnostic procedures using 1% injection

▶ Initially by intravenous infusion

Child 1 month-16 years: Usual dose 1.5–9 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response, followed by (by slow intravenous injection) up to 1 mg/kg, (if rapid increase in sedation required)

Child 17 years: Initially 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response, followed by (by slow intravenous injection) 10–20 mg, (if rapid increase in sedation required)
Maintenance of sedation for surgical and diagnostic procedures using 2% injection

- Initially by intravenous infusion
- Child 3-16 years: Usual dose 1.5–9 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response
- Child 17 years: Initially 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response, followed by (by slow intravenous injection) 10–20 mg, using 0.5% or 1% injection (if rapid increase in sedation required)

IMPORTANT SAFETY INFORMATION
Propofol should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- Contra-indications
  - Children under 16 years receiving intensive care
- Contra-indications, further information
  - Use in intensive care associated with a risk of propofol infusion syndrome (potentially fatal effects, including metabolic acidosis, arrhythmias, cardiac failure, rhabdomyolysis, hyperlipidaemia, hyperkalaemia, hepatomegaly, and renal failure).
- CAUTIONS
  - Acute circulatory failure (shock) • cardiac impairment • cardiovascular disease • epilepsy • fixed cardiac output • hypotension • hypovolaemia • raised intracranial pressure • respiratory impairment
- Interactions
  - Appendix 1: propofol
- Side-effects
  - Common or very common: Headache • hypotension • tachycardia • transient apnoea
  - Uncommon: Phlebitis • thrombosis
  - Rare: Anaphylaxis • arrhythmia • convulsions (onset can be delayed) • delayed recovery from anaesthesia • euphoria
  - Very rare: Discoloration of urine • pancreatitis • pulmonary oedema • sexual disinhibition
  - Frequency not known: Bradycardia • pain on intravenous injection • propofol infusion syndrome • significant extraneous muscle movements
- Side-effects, further information
  - Bradycardia: Bardycardia may be profound and may be treated with intravenous administration of an antimuscarinic drug.
  - Extraneous muscle movement: Extraneous muscle movements can be minimised by an opioid analgesic or a short-acting benzodiazepine given just before induction.
  - Pain on injection: Can be reduced by intravenous lidocaine.
  - Propofol infusion syndrome: Prolonged infusion of propofol doses exceeding 4 mg/kg/hour may result in potentially fatal effects, including metabolic acidosis, arrhythmias, cardiac failure, rhabdomyolysis, hyperlipidaemia, hyperkalaemia, hepatomegaly, and renal failure.
- Pregnancy
  - Max. dose for maintenance of anaesthesia: 6 mg/kg/hour. May depress neonatal respiration if used during delivery.
- Breast feeding
  - Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.
- Hepatic impairment
  - Use with caution.
- Renal impairment
  - Use with caution.
- Monitoring requirements
  - Monitor blood-lipid concentration if risk of fat overload or if sedation longer than 3 days.
- Directions for administration
  - Shake before use; microbiological filter not recommended; may be administered via a Y-piece close to injection site co-administered with Glucose 5% or Sodium chloride 0.9%. 0.5% emulsion for injection or intermittent infusion; may be administered undiluted, or diluted with Glucose 5% or Sodium chloride 0.9%; dilute to a concentration not less than 1 mg/mL. 1% emulsion for injection or infusion; may be administered undiluted, or diluted with Glucose 5% (Diprivan®) or (Propofol-Lipuro®) or Sodium chloride 0.9% (Propofol-Lipuro® only); dilute to a concentration not less than 2 mg/mL; use within 6 hours of preparation. 2% emulsion for infusion; do not dilute.

- Patient and carer advice
  - Driving and skilled tasks
    - Patients given sedatives and analgesics during minor outpatient procedures should be given on careful warning about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.

- Medicinal forms
  - There can be variation in the licensing of different medicines containing the same drug.

Emulsion for infusion

- Diprivan (Aspen Pharma Trading Ltd)
  - Propofol 10 mg per 1 ml: Diprivan 1% emulsion for infusion 50ml pre-filled syringes | 1 pre-filled disposable injection (PoS) £10.68
  - Propofol 20 mg per 1 ml: Diprivan 2% emulsion for infusion 50ml pre-filled syringes | 1 pre-filled disposable injection (PoS) £15.16

Emulsion for injection

- Diprivan (Aspen Pharma Trading Ltd)
  - Propofol 10 mg per 1 ml: Diprivan 1% emulsion for injection 20ml ampoules | 5 ampoule (PoS) £15.36 (Hospital only)
  - Propofol-Lipuro (B. Braun Melsungen AG)
  - Propofol 5 mg per 1 ml: Propofol-Lipuro 0.5% emulsion for injection 20ml ampoules | 5 ampoule (PoS) £14.71

ANAESTHETICS, GENERAL

Volatile halogenated anaesthetics

- Contra-indications
  - Susceptibility to malignant hyperthermia
- CAUTIONS
  - Can trigger malignant hyperthermia • neuromuscular disease (inhalational anaesthetics are very rarely associated with hyperkalaemia, resulting in cardiac arrhythmias and death) • raised intracranial pressure (can increase cerebrospinal pressure)

SIDE-EFFECTS

- Common or very common
  - Arrhythmias • cardiorespiratory depression • hypotension
- Frequency not known
  - Convulsions • mood changes (that can last several days)

- Allergy and cross-sensitivity
  - Can cause hepatotoxicity in those sensitised to halogenated anaesthetics.

- Directions for administration
  - Volatile liquid anaesthetics are administered using calibrated vapourisers, using air, oxygen, or nitrous oxide–oxygen mixtures as the carrier gas. To prevent hypoxia, the inspired gas mixture should contain a minimum of 25% oxygen at all times.
Desflurane

**INDICATIONS AND DOSE**

**Induction of anaesthesia (but not recommended)**
- **BY INHALATION**
- Child 12-17 years: 4–11 %, to be inhaled through specifically calibrated vaporiser

**Maintenance of anaesthesia (in nitrous oxide-oxygen)**
- **BY INHALATION**
- Neonate: 2–6 %, to be inhaled through a specifically calibrated vaporiser.
- Child: 2–6 %, to be inhaled through a specifically calibrated vaporiser

**INTERACTIONS** → Appendix 1: volatile halogenated anaesthetics

**SIDE-EFFECTS** Apnoea · breath-holding · cough · increased secretions · laryngospasm

**PREGNANCY** May depress neonatal respiration if used during delivery.

**BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Inhalation vapour**
- **Desflurane (Non-proprietary)**
  Desflurane 1 ml per 1 ml Desflurane volatile liquid | 240 ml (£)
  no price available (Hospital only)

**Nitrous oxide**

**INDICATIONS AND DOSE**

**Maintenance of anaesthesia in conjunction with other anaesthetic agents**
- **BY INHALATION**
- Neonate: 50–66 %, to be administered using suitable anaesthetic apparatus in oxygen.
- Child: 50–66 %, to be administered using suitable anaesthetic apparatus in oxygen

**Analgesia**
- **BY INHALATION**
- Neonate: Up to 50 %, to be administered using suitable anaesthetic apparatus in oxygen, adjusted according to the patient’s needs.
- Child: Up to 50 %, to be administered using suitable anaesthetic apparatus in oxygen, adjusted according to the patient’s needs

**IMPORTANT SAFETY INFORMATION**
Nitrous oxide should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway

**CAUTIONS** Children under 2 years—limited experience

**INTERACTIONS** → Appendix 1: volatile halogenated anaesthetics

**SIDE-EFFECTS** Breath-holding · cough · irritate mucous membrane · laryngospasm

**PREGNANCY** May depress neonatal respiration if used during delivery.

**BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Inhalation vapour**
- **Isoflurane (Non-proprietary)**
  Isoflurane 1 ml per 1 ml Isoflurane inhalation vapour | 250 ml (£) £35.25 (Hospital only)
  Isoflurane volatile liquid | 250 ml (£) £47.50 (Hospital only)
  AErrane (Baxter Healthcare Ltd)
  AErrane 1 ml per 1 ml AErrane volatile liquid | 250 ml (£) no price available (Hospital only)

**Isoflurane**

**INDICATIONS AND DOSE**

**Induction of anaesthesia (in oxygen or nitrous oxide-oxygen) (but indication not recommended in infants and children of all ages)**
- **BY INHALATION**
- Neonate: Initially 0.5 %, increased to 3 %, adjusted according to response, administered using specifically calibrated vaporiser.
- Child: Initially 0.5 %, increased to 3 %, adjusted according to response, administered using specifically calibrated vaporiser

**Maintenance of anaesthesia (in nitrous oxide-oxygen)**
- **BY INHALATION**
- Neonate: 1–2.5 %, to be administered using specifically calibrated vaporiser; an additional 0.5–1 % may be required when given with oxygen alone.
- Child: 1–2.5 %, to be administered using specifically calibrated vaporiser; an additional 0.5–1 % may be required when given with oxygen alone

**IMPORTANT SAFETY INFORMATION**
Isoflurane is not recommended for induction of anaesthesia in infants and children of all ages because of the occurrence of cough, breath-holding, desaturation, increased secretions, and laryngospasm.

**CAUTIONS** Children under 2 years—limited experience

**INTERACTIONS** → Appendix 1: volatile halogenated anaesthetics

**SIDE-EFFECTS** Breath-holding · cough · irritate mucous membrane · laryngospasm

**PREGNANCY** May depress neonatal respiration if used during delivery.

**BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Inhalation vapour**
- **Isoflurane volatile liquid**
  Isoflurane 1 ml per 1 ml Isoflurane volatile liquid | 250 ml (£) no price available (Hospital only)

**BNFC 2017–2018**

*General anaesthesia 777*
management, and when resuscitation equipment is available.

- **CAUTIONS** Entrapped air following recent underwater dive - pneumothorax - presence of intracranial air after head injury - recent intra-ocular gas injection

**CAUTIONS, FURTHER INFORMATION**

Nitrous oxide may have a deleterious effect if used in patients with an air-containing closed space since nitrous oxide diffuses into such a space with a resulting increase in pressure. This effect may be dangerous in conditions such as pneumothorax, which may enlarge to compromise respiration, or in the presence of intracranial air after head injury, entrapped air following recent underwater dive, or recent intra-ocular gas injection.

- **INTERACTIONS** → Appendix 1: nitrous oxide
- **SIDE-EFFECTS** Depressive symptoms of white blood cell formation - hypoxia - megaloblastic anaemia - neurological toxic effects

**SIDE-EFFECTS, FURTHER INFORMATION**

- Hypoxia Hypoxia can occur immediately following the administration of nitrous oxide; additional oxygen should always be given for several minutes after stopping the flow of nitrous oxide.
- Prolonged exposure Exposure of patients to nitrous oxide for prolonged periods, either by continuous or by intermittent administration, may result in megaloblastic anaemia owing to interference with the action of vitamin B12; neurological toxic effects can occur without preceding overt haematological changes. Depression of white cell formation may also occur.
- **PREGNANCY** May depress neonatal respiration if used during delivery.
- **BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.
- **MONITORING REQUIREMENTS**
  - Assessment of plasma-vitamin B12 concentration should be considered in those at risk of deficiency, including those who have a poor vegetarian, or vegan diet, and those with a history of anaemia.
- Nitrous oxide should not be given continuously for longer than 24 hours or more frequently than every 4 days without close supervision and haematological monitoring.
- **DIRECTIONS FOR ADMINISTRATION** For analgesia (without loss of consciousness), a mixture of nitrous oxide and oxygen containing the same drug.
- **HANDBLING AND STORAGE** Exposure of theatre staff to nitrous oxide should be minimised (risk of serious side-effects).
- **PATIENT AND CARER ADVICE**

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Inhalation gas**

- **Nitrous oxide (Non-proprietary)**
  - Nitrous oxide 1 ml per 1 ml Nitrous oxide cylinders size F | 1800 litre £800 no price available
  - Medical Nitrous Oxide cylinders size D | 900 litre £1600 no price available

  - Medical Nitrous Oxide cylinders size E | 1800 litre £500 no price available

**Sevoflurane**

- **INDICATIONS AND DOSE**
  - **Induction of anaesthesia (in oxygen or nitrous oxide–oxygen)**
    - **BY INHALATION**
      - Neonate: Up to 4%, adjusted according to response, to be administered using specifically calibrated vaporiser.
      - Child: Initially 0.5–1%, then increased to up to 8%, increased gradually, according to response, to be administered using specifically calibrated vaporiser
  - **Maintenance of anaesthesia (in oxygen or nitrous oxide–oxygen)**
    - **BY INHALATION**
      - Neonate: 0.5–2%, adjusted according to response, to be administered using specifically calibrated vaporiser.
      - Child: 0.5–3%, adjusted according to response, to be administered using specifically calibrated vaporiser

- **CAUTIONS** Susceptibility to QT-interval prolongation
- **INTERACTIONS** → Appendix 1: volatile halogenated anaesthetics
- **SIDE-EFFECTS** Agitation - cardiac arrest - dystonia - leucopenia - torsade de pointes - urinary retention
- **PREGNANCY** May depress neonatal respiration if used during delivery.
- **BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.
- **RENAL IMPAIRMENT** Use with caution.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Inhalation vapour**

- **Sevoflurane (Non-proprietary)**
  - Sevoflurane 1 ml per 1 ml Sevoflurane volatile liquid | 250 ml £123.00 (Hospital only)

1 Anaesthesia adjuvants

Pre-medication and peri-operative drugs

**Drugs that affect gastric pH**

Regurgitation and aspiration of gastric contents (Mendelson’s syndrome) can be a complication of general anaesthesia, particularly in obstetrics and in gastrooesophageal reflux disease; prophylaxis against acid aspiration is not routinely used in children but may be required in high-risk cases.

An H2-receptor antagonist can be used before surgery to increase the pH and reduce the volume of gastric fluid. It does not affect the pH of fluid already in the stomach and this limits its value in emergency procedures; an oral H2-receptor antagonist can be given 1–2 hours before the procedure.

**Antimuscarinic drugs**

Antimuscarinic drugs are used (less commonly nowadays) as premedicants to dry bronchial and salivary secretions which are increased by intubation, upper airway surgery, or some inhalational anaesthetics. They are also used before or with neostigmine p. 619 to prevent bradycardia, excessive salivation, and other muscarinic actions of neostigmine. They also prevent bradycardia and hypotension associated
with drugs such as propofol p. 775 and suxamethonium chloride p. 782.

Atropine sulfate below is now rarely used for premedication but still has an emergency role in the treatment of vagotonic side-effects. Atropine sulfate may have a role in cardiopulmonary resuscitation.

Hyoscine hydrobromide p. 256 reduces secretions and also provides a degree of amnesia, sedation, and anti-emesis; unlike atropine sulfate it may produce bradycardia rather than tachycardia.

Glycopyrronium bromide p. 780 reduces salivary secretions. When given intravenously it produces less tachycardia than atropine sulfate. It is widely used with neostigmine for reversal of non-depolarising muscle relaxants.

Glycopyrronium bromide or hyoscine hydrobromide are also used to control excessive secretions in upper airways or hypersalivation in palliative care and in children unable to control posture or with abnormal swallowing reflex; effective dose varies and tolerance may develop. The intramuscular route should be avoided if possible. Hyoscine hydrobromide transdermal patches may also be used.

**Sedative drugs**

**Premedication**

Fear and anxiety before a procedure (including the night before) can be minimised by using a sedative drug, usually a benzodiazepine. Premedication may also augment the action of anaesthetics and provide some degree of pre-operative amnesia. The choice of drug depends on the individual, the nature of the procedure, the anaesthetic to be used, and other prevailing circumstances such as outpatients, obstetrics, and availability of recovery facilities. The choice also varies between elective and emergency procedures. Oral administration is preferred if possible; the rectal route should only be used in exceptional circumstances.

Premedicants can be given the night before major surgery; a further, smaller dose may be required before surgery. Alternatively, the first dose may be given on the day of the procedure.

Oral midazolam p. 215 is the most common premedicant for children; temazepam p. 790 may be used in older children. The antihistamine atenolol tartrate p. 171 is occasionally used orally, but when given alone it may cause postoperative restlessness in the presence of pain.

**Benzodiazepines**

Benzodiazepines possess useful properties for premedication including relief of anxiety, sedation, and amnesia; short-acting benzodiazepines taken by mouth are the most common premedicants. Benzodiazepines are also used for sedation prior to clinical procedures and for sedation in intensive care.

Benzodiazepines may occasionally cause marked respiratory depression and facilities for its treatment are essential; flumazenil p. 811 is used to antagonise the effects of benzodiazepines.

Midazolam, a water-soluble benzodiazepine, is the preferred benzodiazepine for premedication and for sedation for clinical procedures in children. It has a fast onset of action, and recovery is faster than for other benzodiazepines. Recovery may be longer in children with a low cardiac output, or after repeated dosing.

Midazolam can be given by mouth [unlicensed], but its bitter acidic taste may need to be disguised. It can also be given buccally [unlicensed indication] or intranasally [unlicensed]. Midazolam is associated with profound sedation when high doses are given or when it is used with certain other drugs. It can cause severe dis inhibition and restlessness in some children. Midazolam is not recommended for prolonged sedation in neonates; drug accumulation is likely to occur.

Temazepam is given by mouth for premedication in older children and has a short duration of action. Anxiolytic and sedative effects last about 90 minutes, although there may be residual drowsiness. Temazepam is rarely used for dental procedures in children.

Lorazepam p. 214 produces more prolonged sedation than temazepam and it has marked amnesic effects.

Peri-operative use of diazepam p. 212 is not recommended in children; onset and magnitude of response are unreliable, and paradoxical effects may occur. Diazepam is not used for dental procedures in children.

**Antagonists for central and respiratory depression**

Respiratory depression is a major concern with opioid analgesics and it may be treated by artificial ventilation or be reversed by an opioid antagonist. Naloxone hydrochloride p. 813 given intravenously immediately reverses opioid-induced respiratory depression but the dose may have to be repeated because of its short duration of action.

Intramuscular injection of naloxone hydrochloride produces a more gradual and prolonged effect but absorption may be erratic. Care is required in children requiring pain relief because naloxone hydrochloride also antagonises the analgesic effect of opioids.

Flumazenil is a benzodiazepine antagonist for the reversal of the central sedative effects of benzodiazepines after anaesthetic and similar procedures. Flumazenil has a shorter half-life and duration of action than diazepam or midazolam so patients may become resedated.

**Neonates**

Naloxone hydrochloride is used in newborn infants to reverse respiratory depression and sedation resulting from the use of opioids by the mother, usually for pain during labour. In neonates the effects of opioids may persist for up to 48 hours and in such cases naloxone hydrochloride is often given by intramuscular injection for its prolonged effect. In severe respiratory depression after birth, breathing should first be established (using artificial means if necessary) and naloxone hydrochloride administered only if use of opioids by the mother is thought to cause the respiratory depression; the infant should be monitored closely and further doses of naloxone hydrochloride administered as necessary.

**ANTIMUSCARINICS**

### Atropine sulfate

**INDICATIONS AND DOSE**

- **Bradycardia due to acute massive overdosage of beta-blockers**
  - By intravenous injection
  - Child: 40 micrograms/kg (max. per dose 3 mg)

**Treatment of poisoning by organophosphorus insecticide or nerve agent (in combination with pralidoxime chloride)**

- **By intravenous injection**
  - Child: 20 micrograms/kg every 5–10 minutes (max. per dose 2 mg) until the skin becomes flushed and dry, the pupils dilate, and bradycardia is abolished, frequency of administration dependent on the severity of poisoning

**Premedication**

- **By intravenous injection**
  - Neonate: 10 micrograms/kg, to be administered immediately before induction of anaesthesia.
  - Child 1 month–11 years: 20 micrograms/kg, to be administered immediately before induction of anaesthesia (minimum 100 micrograms, max. 600 micrograms)

---

*Note: For further details, consult the full text.*
Control of muscarinic side-effects of neostigmine in reversal of competitive neuromuscular block

- **BY INTRAVENOUS INJECTION**
  - Neonate: 10–20 micrograms/kg.
  - Child 1–12 years: 20 micrograms/kg (max. per dose 1.2 mg).
  - Child 12–17 years: 0.6–1.2 mg.

**UNLICENSED USE** Not licensed for use in children under 12 years for intra-operative bradycardia or by intravenous route for premedication. Not licensed for use by oral route.

**IMPORTANT SAFETY INFORMATION**

Antimuscarinic drugs used for premedication to general anaesthesia should only be administered by, or under the direct supervision of, personnel experienced in their use.

**INDICATIONS AND DOSE**

**Premedication at induction**

- **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**
  - Neonate: 5 micrograms/kg.
  - Child 1 month–11 years: 4–8 micrograms/kg (max. per dose 200 micrograms).
  - Child 12–17 years: 200–400 micrograms, alternatively 4–5 micrograms/kg (max. per dose 400 micrograms).

**Intra-operative bradycardia**

- **BY INTRAVENOUS INJECTION**
  - Neonate: 10 micrograms/kg, repeated if necessary.
  - Child: 4–8 micrograms/kg (max. per dose 200 micrograms), repeated if necessary.

**Control of muscarinic side-effects of neostigmine in reversal of non-depolarising neuromuscular block**

- **BY INTRAVENOUS INJECTION**
  - Neonate: 10 micrograms/kg.
  - Child 1 month–11 years: 10 micrograms/kg (max. per dose 500 micrograms).
  - Child 12–17 years: 10–15 micrograms/kg, alternatively, 200 micrograms per 1 mg of neostigmine to be administered.

**Control of upper airways secretion | Hypersalivation**

- **BY MOUTH**
  - Child: 40–100 micrograms/kg 3–4 times a day (max. per dose 2 mg), adjusted according to response, dose to be administered using tablets or injection solution, see Directions for administration.
  - **BY SUBCUTANEOUS INFUSION**
  - Child 1 month–11 years: 12–40 micrograms/kg (max. per dose 1.2 mg) over 24 hours.
Neuromuscular blockade

Neuromuscular blocking drugs

Neuromuscular blocking drugs used in anaesthesia are also known as muscle relaxants. By specific blockade of the neuromuscular junction they enable light anaesthesia to be used with adequate relaxation of the muscles of the abdomen and diaphragm. They also relax the vocal cords and allow the passage of a tracheal tube. Their action differs from the muscle relaxants used in musculoskeletal disorders that act on the spinal cord or brain.

Children who have received a neuromuscular blocking drug should always have their respiration assisted or controlled until the drug has been inactivated or antagonised. They should also receive sufficient concomitant inhalational or intravenous anaesthetic or sedative drugs to prevent awareness.

Non-depolarising neuromuscular blocking drugs

Non-depolarising neuromuscular blocking drugs (also known as competitive muscle relaxants) compete with acetylcholine for receptor sites at the neuromuscular junction and their action can be reversed with anticholinesterases such as neostigmine p. 619. Non-depolarising neuromuscular blocking drugs can be divided into the aminosteroid group, comprising pancuronium bromide p. 785, rocuronium bromide p. 785, and vecuronium bromide p. 785, and the benzylisoquinolinium group, comprising atracurium besilate p. 783, cisatracurium p. 784, and mivacurium p. 784.

Non-depolarising neuromuscular blocking drugs have a slower onset of action than suxamethonium chloride p. 782. These drugs can be classified by their duration of action as short-acting (15–30 minutes), intermediate-acting (30–40 minutes), and long-acting (60–120 minutes), although duration of action is dose-dependent. Drugs with a shorter or intermediate duration of action, such as atracurium besilate and vecuronium bromide, are more widely used than those with a longer duration of action, such as pancuronium bromide.

Non-depolarising neuromuscular blocking drugs have no sedative or analgesic effects and are not considered to trigger malignant hyperthermia.

For patients receiving intensive care and who require tracheal intubation and mechanical ventilation, a non-depolarising neuromuscular blocking drug is chosen according to its onset of effect, duration of action, and side-effects. Rocuronium bromide, with a rapid onset of effect, may facilitate intubation. Atracurium besilate or cisatracurium may be suitable for long-term neuromuscular blockade since their duration of action is not dependent on elimination by the liver or the kidneys.
Atracurium besilate, a mixture of 10 isomers, is a benzylisoquinolinium neuromuscular blocking drug with an intermediate duration of action. It undergoes non-enzymatic metabolism which is independent of liver and kidney function, thus allowing its use in children with hepatic or renal impairment. Cardiovascular effects are associated with significant histamine release; histamine release can be minimised by administering slowly or in divided doses over at least 1 minute. Neonates may be more sensitive to the effects of atracurium besilate and lower doses may be required.

Cisatracurium is a single isomer of atracurium besilate. It is more potent and has a slightly longer duration of action than atracurium besilate and provides greater cardiovascular stability because cisatracurium lacks histamine-releasing effects. In children aged 1 month to 12 years, cisatracurium has a shorter duration of action and produces faster spontaneous recovery.

Mivacurium, a benzylisoquinolinium neuromuscular blocking drug, has a short duration of action. It is metabolised by plasma cholinesterase and muscle paralysis is prolonged in individuals deficient in this enzyme. It is not associated with vagolytic activity or ganglionic blockade although histamine release can occur, particularly with rapid injection. In children under 12 years mivacurium has a faster onset, shorter duration of action, and produces more rapid spontaneous recovery.

Pancuronium bromide, an aminosteroid neuromuscular blocking drug, has a long duration of action and is often used in children receiving long-term mechanical ventilation in intensive care units. It lacks a histamine-releasing effect, but vagolytic and sympathomimetic effects can cause tachycardia and hypertension. The half-life of pancuronium bromide is prolonged in neonates; neonates should receive postoperative intermittent positive pressure ventilation.

Rocuronium bromide exerts an effect within 2 minutes and has the most rapid onset of any of the non-depolarising neuromuscular blocking drugs. It is an aminosteroid neuromuscular blocking drug with an intermediate duration of action. It is reported to have minimal cardiovascular effects; high doses produce mild vagolytic activity. In most children, the duration of action of rocuronium bromide may be shorter than in adults; however, in neonates and children under 2 years, usual doses may produce a more prolonged action.

Vecuronium bromide, an aminosteroid neuromuscular blocking drug, has an intermediate duration of action. It does not generally produce histamine release and lacks cardiovascular effects. In most children, the duration of action of vecuronium bromide may be shorter than in adults; however, in neonates and children under 2 years, usual doses may produce a more prolonged action.

Depolarising neuromuscular blocking drugs
Suxamethonium chloride has the most rapid onset of action of any of the neuromuscular blocking drugs and is ideal if fast onset and brief duration of action are required e.g. with tracheal intubation. Neonates and young children are less sensitive to suxamethonium chloride and a higher dose may be required. Unlike the non-depolarising neuromuscular blocking drugs, its action cannot be reversed and recovery is spontaneous; anticholinesterases such as neostigmine potentiate the neuromuscular block.

Suxamethonium chloride should be given after anaesthetic induction because paralysis is usually preceded by painful muscle fasciculations. Bradycardia may occur; premedication with atropine sulfate p. 779 reduces bradycardia as well as the excessive salivation associated with suxamethonium chloride use.

Prolonged paralysis may occur in dual block, which occurs with high or repeated doses of suxamethonium chloride and is caused by the development of a non-depolarising block following the initial depolarising block. Children with myasthenia gravis are resistant to suxamethonium chloride but can develop dual block resulting in delayed recovery. Prolonged paralysis may also occur in those with low or atypical plasma cholinesterase. Assisted ventilation should be continued until muscle function is restored.

**NEUROMUSCULAR BLOCKING DRUGS > DEPOLARISING**

**Suxamethonium chloride**
(Succinylcholine chloride)

- **DRUG ACTION** Suxamethonium acts by mimicking acetylcholine at the neuromuscular junction but hydrolysis is much slower than for acetylcholine; depolarisation is therefore prolonged, resulting in neuromuscular blockade.

- **INDICATIONS AND DOSE**
  - **Neuromuscular blockade (short duration) during surgery**
    - **BY INTRAVENOUS INJECTION**
    - Neonate: 2 mg/kg, produces 5–10 minutes neuromuscular blockade.
    - Child 1–17 years: 1 mg/kg
  - **BY INTRAMUSCULAR INJECTION**
    - Neonate: Up to 4 mg/kg, produces 10–30 minutes neuromuscular blockade.
    - Child 1–11 years: Up to 5 mg/kg

- **PHARMACOKINETICS** Intramuscular injection has a duration of onset of 2–3 minutes.

**IMPORTANT SAFETY INFORMATION** Should only be administered by, or under the direct supervision of, personnel experienced in its use.

- **CONTRA-INDICATIONS** Duchenne muscular dystrophy · family history of malignant hyperthermia · hyperkaemia · low plasma-cholinesterase activity (including severe liver disease) · major trauma · neurological disease involving acute wasting of major muscle · personal or family history of congenital myotonic disease · prolonged immobilisation (risk of hyperkaemia) · severe burns

- **CAUTIONS** Cardiac disease · neuromuscular disease · raised intra-ocular pressure (avoid in penetrating eye injury) · respiratory disease · severe sepsis (risk of hyperkaemia)

- **INTERACTIONS** Appendix 1: suxamethonium

- **SIDE-EFFECTS**
  - **Common or very common** Flushing · hyperkaemia · increased gastric pressure · increased intra-ocular pressure · myoglobinemia · myoglobinuria · postoperative muscle pain · rash
  - **Rare** Apnoea · arrhythmias · bronchospasm · cardiac arrest · limited jaw mobility · prolonged respiratory depression
  - **Very rare** Anaphylactic reactions · malignant hyperthermia
  - **Frequency not known** Bradycardia (may occur with the first dose) · hypertension · hypotension · rhabdomyolysis · tachycardia (occurs with single use)

- **SIDE-EFFECTS, FURTHER INFORMATION** Bradycardia Premedication with atropine reduces bradycardia as well as the excessive salivation associated with suxamethonium use.

- **ALLERGY AND CROSS-SENSITIVITY** Allergic cross-reactivity between neuromuscular blocking drugs has been reported; caution is advised in cases of hypersensitivity to these drugs.
**Neuromuscular blockade**

---

### Atracurium besylate

**INICATIONS AND DOSE**

**Neuromuscular blockade (short to intermediate duration) for surgery**

- **INITIALLY BY INTRAVENOUS INJECTION**

- **Neonate:** Initially 300–500 micrograms/kg, followed by (by intravenous injection) 100–200 micrograms/kg, repeated if necessary, alternatively (by intravenous infusion) 300–400 micrograms/kg/hour, adjusted according to response.

- **Child:** Initially 300–600 micrograms/kg, then (by intravenous injection) 100–200 micrograms/kg, repeated if necessary, alternatively (by intravenous injection) initially 300–600 micrograms/kg, followed by (by intravenous infusion) 300–600 micrograms/kg/hour, adjusted according to response.

**Neuromuscular blockade during intensive care**

- **INITIALLY BY INTRAVENOUS INJECTION**

- **Neonate:** Initially 300–500 micrograms/kg, followed by (by intravenous injection) 100–200 micrograms/kg, repeated if necessary, alternatively (by intravenous infusion) 300–400 micrograms/kg/hour, adjusted according to response, higher doses may be necessary.

- **Child:** Initially 300–600 micrograms/kg, initial dose is optional, then (by intravenous infusion) 270–1770 micrograms/kg/hour; (by intravenous infusion) usual dose 650–780 micrograms/kg/hour.

**DOSES AT EXTREMES OF BODY-WEIGHT**

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

---

### Non-depolarising neuromuscular blocking drugs

**IMPORTANT SAFETY INFORMATION**

Non-depolarising neuromuscular blocking drugs should only be administered by, or under direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

- **CAUTIONS** Burns (resistance can develop, increased doses may be required) · cardiovascular disease (reduce rate of administration) · electrolyte disturbances (response unpredictable) · fluid disturbances (response unpredictable) · hypothermia (activity prolonged, lower doses required) · myasthenia gravis (activity prolonged, lower doses required) · neuromuscular disorders (response unpredictable)

- **ALLERGY AND CROSS-SENSITIVITY** Allergic cross-reactivity between neuromuscular blocking drugs has been reported; caution is advised in cases of hypersensitivity to these drugs.

- **PREGNANCY** Non-depolarising neuromuscular blocking drugs are highly ionised at physiological pH and are therefore unlikely to cross the placenta in significant amounts.

- **BREAST FEEDING** Non-depolarising neuromuscular blocking drugs are ionised at physiological pH and are unlikely to be present in milk in significant amounts. Breast-feeding may be resumed once the mother has recovered from neuromuscular block.
Cisatracurium

**INDICATIONS AND DOSE**

**Neuromuscular blockade (intermediate duration) during surgery**

- Initially by intravenous injection
  - Child 1 month–1 year: Initially 150 micrograms/kg, then (by intravenous injection) 30 micrograms/kg every 20 minutes as required
  - Child 2–11 years: Initially 150 micrograms/kg, 80–100 micrograms/kg if not for intubation, then (by intravenous injection) 20 micrograms/kg every 10 minutes as required, alternatively (by intravenous injection) initially 150 micrograms/kg, followed by (by intravenous infusion) 180 micrograms/kg/hour, (by intravenous infusion) reduced to 60–120 micrograms/kg/hour, adjusted according to response
  - Child 12–17 years: Initially 150 micrograms/kg, then (by intravenous injection) 30 micrograms/kg every 20 minutes as required, alternatively (by intravenous injection) initially 150 micrograms/kg, followed by (by intravenous infusion) 180 micrograms/kg/hour, (by intravenous infusion) reduced to 60–120 micrograms/kg/hour, adjusted according to response

**DOSES AT EXTREMES OF BODY-WEIGHT**

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

**INTERACTIONS** → Appendix 1: neuromuscular blocking drugs, non-depolarising

**SIDE-EFFECTS**

Acute myopathy (after prolonged use in intensive care) - bradycardia

**DIRECTIONS FOR ADMINISTRATION**

For continuous intravenous infusion, dilute to a concentration of 0.1–2 mg/mL, with Glucose 5% or Sodium Chloride 0.9%; solutions of 2 mg/mL and 5 mg/mL may be infused undiluted.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Cisatracurium (Non-proprietary)**
  - Cisatracurium (as Cisatracurium besilate) 2 mg per 1 ml Cisatracurium besilate 200 mg/25 ml solution for injection vials | 1 vial (POD) £20.00
  - Cisatracurium besilate 20 mg/10 ml solution for injection ampoules | 5 ampoule (POD) £32.05
  - Cisatracurium besilate 200 mg/25 ml solution for injection vials | 5 ampoule (POD) £37.75 (Hospital only)

- **Mivacurium (GlaxoSmithKline UK Ltd)**
  - Mivacurium (as Mivacurium chloride) 2 mg per 1 ml Mivacurium 10 mg/5 ml solution for injection ampoules | 5 ampoule (POD) £13.95

**Mivacurium**

**INDICATIONS AND DOSE**

Neuromuscular blockade (short duration) during surgery

- Initially by intravenous injection
  - Child 2–5 months: Initially 150 micrograms/kg, then (by intravenous injection) 100 micrograms/kg every 6–9 minutes as required, alternatively (by intravenous infusion) 8–10 micrograms/kg/minute, (by intravenous infusion) adjusted in steps of 1 microgram/kg/minute every 3 minutes if required; (by intravenous infusion) usual dose 11–14 micrograms/kg/minute
  - Child 6 months–11 years: Initially 200 micrograms/kg, then (by intravenous injection) 100 micrograms/kg every 6–9 minutes as required, alternatively (by intravenous infusion) 8–10 micrograms/kg/minute, (by intravenous infusion) adjusted in steps of 1 microgram/kg/minute every 3 minutes if required; (by intravenous infusion) usual dose 11–14 micrograms/kg/minute

**DOSES AT EXTREMES OF BODY-WEIGHT**

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

**INTERACTIONS**

Burns (low plasma cholinesterase activity; dose titration required)

**SIDE-EFFECTS**

- Very rare Anaphylactoid reactions
  - Frequency not known Bronchospasm - hypotension - skin flushing - tachycardia

**HEPATIC IMPAIRMENT**

Reduce dose in severe impairment.

**RENAL IMPAIRMENT**

Clinical effect prolonged in renal failure—reduce dose according to response.

**DIRECTIONS FOR ADMINISTRATION**

For intravenous injection, give undiluted or dilute in Glucose 5% or Sodium Chloride 0.9%. Doses up to 150 micrograms/kg may be given over 5–15 seconds, higher doses should be given over 30 seconds. In asthma, cardiovascular disease or in those sensitive to reduced arterial blood pressure, give over 60 seconds.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Mivacurium (GlaxoSmithKline UK Ltd)**
  - Mivacurium (as Mivacurium chloride) 2 mg per 1 ml Mivacurium 20 mg/10 ml solution for injection ampoules | 5 ampoule (POD) £22.57
Pancuronium bromide

**INDICATIONS AND DOSE**

Neuromuscular blockade (long duration) during surgery
- **BY INTRAVENOUS INJECTION**
  - Neonate: Initially 100 micrograms/kg, then 50 micrograms/kg, repeated if necessary.
  - Child: Initially 100 micrograms/kg, then 20 micrograms/kg, repeated if necessary.

**DOSES AT EXTREMES OF BODY-WEIGHT**
To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal bodyweight.

**INTERACTIONS** → Appendix 1: neuromuscular blocking drugs, non-depolarising

**SIDE-EFFECTS**
- Acute myopathy (after prolonged use in intensive care) - hypertension - tachycardia

**SIDE-EFFECTS, FURTHER INFORMATION**
Pancuronium lacks histamine-releasing effect, but vagolytic and sympathomimetic effects can cause tachycardia and hypertension.

**HEPATIC IMPAIRMENT** Possibly slower onset, higher dose requirement, and prolonged recovery time.

**RENAL IMPAIRMENT** Use with caution; prolonged duration of block.

**DIRECTIONS FOR ADMINISTRATION**
For intravenous injection, give undiluted or dilute in Glucose 5% or Sodium Chloride 0.9%.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **Pancuronium bromide (Non-proprietary)**
  - **Rocuronium bromide 10 mg per 1 ml**
    - Rocuronium bromide 50mg/5ml solution for injection ampoules | 10 ampoule (£24.00)
    - Rocuronium bromide 50mg/5ml solution for injection vials | 10 vial (£28.00–£30.00)
  - **Rocuronium bromide 100mg/10ml solution for injection vials** | 10 vial (£57.00–£57.90)
  - **Esmeron** (Merck Sharp & Dohme Ltd)
    - **Rocuronium bromide 10 mg per 1 ml**
      - Esmeron 50mg/5ml solution for injection vials | 10 vial (£28.92 (Hospital only))
      - Esmeron 100mg/10ml solution for injection vials | 10 vial (£57.85 (Hospital only))

Vecuronium bromide

**INDICATIONS AND DOSE**

Neuromuscular blockade (intermediate duration) during surgery
- **INITIALLY BY INTRAVENOUS INJECTION**
  - Neonate: Initially 80 micrograms/kg, then (by intravenous injection) 30–50 micrograms/kg, adjusted according to response.
  - Child: Initially 80–100 micrograms/kg, then (by intravenous injection) 20–30 micrograms/kg, repeated if necessary, alternatively (by intravenous infusion) 0.8–1.4 micrograms/kg/minute, adjusted according to response.

**Assisted ventilation in intensive care**
- **INITIALLY BY INTRAVENOUS INJECTION**
  - Neonate: Initially 80 micrograms/kg, then (by intravenous injection) 30–50 micrograms/kg, adjusted according to response, alternatively (by intravenous injection) initially 80 micrograms/kg, then (by intravenous infusion) 0.8–1.4 micrograms/kg/minute, adjusted according to response, risk of accumulation—consider interruption of infusion.
  - Child: Initially 80–100 micrograms/kg, initial dose is optional, then (by intravenous infusion) 0.8–1.4 micrograms/kg/minute, adjusted according to response, (by intravenous infusion) increased if necessary up to 3 micrograms/kg/minute

**DOSES AT EXTREMES OF BODY-WEIGHT**
To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal bodyweight.

**UNLICENSED USE**
Not licensed for assisted ventilation in intensive care.

**INTERACTIONS** → Appendix 1: neuromuscular blocking drugs, non-depolarising

**SIDE-EFFECTS**
- Anaphylactoid reactions
- Very rare: Acute myopathy (after prolonged use in intensive care) - bronchospasm - hypotension - skin flushing - tachycardia

**SIDE-EFFECTS, FURTHER INFORMATION**
Vagolytic and sympathomimetic effects can cause hypotension and tachycardia.
**1.2 Neuromuscular blockade reversal**

**Drugs for reversal of neuromuscular blockade**

**Anticholinesterases**

Anticholinesterases reverse the effects of the non-depolarising (competitive) neuromuscular blocking drugs such as pancuronium bromide but they prolong the action of the depolarising neuromuscular blocking drug suxamethonium chloride.

Neostigmine is used specifically for reversal of non-depolarising (competitive) blockade. It acts within one minute of intravenous injection and its effects last for 20 to 30 minutes; a second dose may then be necessary. Glycopyrronium bromide p. 780 or alternatively atropine sulfate, given before or with neostigmine, prevent bradycardia, excessive salivation, and other muscarinic effects of neostigmine.

**Other drugs for reversal of neuromuscular blockade**

Sugammadex below is a modified gamma cyclodextrin that can be used in children for the routine reversal of neuromuscular blockade induced by rocuronium bromide.

**ANTIDOTES AND CHELATORS**

**Sugammadex**

- **INDICATIONS AND DOSE**
  - Routine reversal of neuromuscular blockade induced by rocuronium
    - By intravenous injection
      - Child 2–17 years: 2 mg/kg (consult product literature)

**IMPORTANT SAFETY INFORMATION**

Should only be administered by, or under the direct supervision of, personnel experienced in its use.

- **CAUTIONS** Cardiovascular disease (recovery may be delayed), pre-existing coagulation disorders, recurrence of neuromuscular blockade—monitor respiratory function until fully recovered, use of anticoagulants (unrelated to surgery) • wait 24 hours before re-administering rocuronium

- **INTERACTIONS** → Appendix 1: sugammadex

- **SIDE-EFFECTS** Bradycardia, bronchospasm, cardiac arrest • hypersensitivity reactions

- **PREGNANCY** Use with caution—no information available.

- **RENAL IMPAIRMENT** Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

- **DIRECTIONS FOR ADMINISTRATION** For intravenous injection dose may be diluted to a concentration of 10 mg/mL with Sodium Chloride 0.9%.

- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium, has advised (February 2013) that sugammadex (Bridion®) is accepted for restricted use within NHS Scotland for the routine reversal of neuromuscular blockade in high-risk patients only, or where prompt reversal of neuromuscular block is required.
1.3 Peri-operative analgesia

Peri-operative analgesia

Non-opioid analgesics

Since non-steroidal anti-inflammatory drugs (NSAIDs) do not depress respiration, do not impair gastro-intestinal motility, and do not cause dependence, they may be useful alternatives or adjuncts to opioids for the relief of postoperative pain. NSAIDs may be inadequate for the relief of severe pain.

Diclofenac sodium p. 623, diclofenac potassium p. 622, ibuprofen p. 625, paracetamol p. 260, and ketorolac trometamol below are used to relieve postoperative pain in children; diclofenac sodium and paracetamol can be given parenterally and rectally as well as by mouth. Ketorolac trometamol is given by intravenous injection.

Opioid analgesics

Opioid analgesics are now rarely used as premedicants; they are more likely to be administered at induction. Pre-operative use of opioid analgesics is generally limited to children who require control of existing pain. The main side-effects of opioid analgesics are respiratory depression, cardiovascular depression, nausea, and vomiting; see general notes on opioid analgesics and their use in postoperative pain.

See the management of opioid-induced respiratory depression in Pre-medication and peri-operative drugs p. 778.

Intra-operative analgesia

Opioid analgesics given in small doses before or with induction reduce the dose requirement of some drugs used during anaesthesia.

Alfentanil p. 788, fentanyl p. 268, and remifentanil p. 789 are particularly useful because they act within 1–2 minutes and have short durations of action. The initial doses of alfentanil or fentanyl are followed either by successive intravenous injections or by an intravenous infusion; prolonged infusions increase the duration of effect.

In contrast to other opioids which are metabolised in the liver, remifentanil undergoes rapid metabolism by nonspecific blood and tissue esterases; its short duration of action allows prolonged administration at high dosage, without accumulation, and with little risk of residual postoperative respiratory depression. Remifentanil should not be given by intravenous injection intraoperatively, but it is well suited to continuous infusion; a supplementary analgesic is given before stopping the infusion of remifentanil.

Ketorolac trometamol

**INDICATIONS AND DOSE**

Short-term management of moderate to severe acute postoperative pain only

- By intramuscular injection, or by intravenous injection
  - Child 16–17 years (body-weight up to 50 kg): Initially 10 mg, then 10–30 mg every 4–6 hours as required for maximum duration of treatment 2 days, frequency may be increased to up to every 2 hours during initial postoperative period; maximum 60 mg per day
  - Child 16–17 years (body-weight 50 kg and above): Initially 10 mg, then 10–30 mg every 4–6 hours as required for maximum duration of treatment 2 days, frequency may be increased to up to every 2 hours during initial postoperative period; maximum 90 mg per day
  - By intravenous injection
    - Child 6 months–15 years: Initially 0.5–1 mg/kg (max. per dose 15 mg), then 500 micrograms/kg every 6 hours (max. per dose 15 mg) as required for maximum duration of treatment 2 days; maximum 60 mg per day

**UNLICENSED USE** Not licensed for use in children under 16 years.

**CONTRA-INDICATIONS** Active or history of gastrointestinal bleeding - active or history of gastrointestinal ulceration - coagulation disorders - complete or partial syndrome of nasal polyps - confirmed or suspected cerebrovascular bleeding - dehydration - following operations with high risk of haemorrhage or incomplete haemostasis - haemorrhagic diatheses - history of gastrointestinal perforation - hypovolaemia - severe heart failure

**CAUTIONS** Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease - coagulation defects - connective-tissue disorders - Crohn’s disease (may be exacerbated) - heart failure - ischaemic heart disease - peripheral arterial disease - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated) - uncontrolled hypertension

**INTERACTIONS** Appendix 1: NSAIDs

**SIDE-EFFECTS**

- Rare: Alveolitis - aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) - hepatic damage - interstitial fibrosis associated with NSAIDs can lead to renal failure - pancreatitis - papillary necrosis associated with NSAIDs can lead to renal failure - pulmonary oesinophilia - Stevens-Johnson syndrome - toxic epidermal necrolysis

Alfentanil

- **INDICATIONS AND DOSE**

  **Assisted ventilation: analgesia and enhancement of anaesthesia for short procedures**
  - By intravenous injection

  - Neonate: Initially 5–20 micrograms/kg, dose to be administered over 30 seconds; supplemental doses up to 10 micrograms/kg.

  - Child: Initially 10–20 micrograms/kg, dose to be administered over 30 seconds; supplemental doses up to 10 micrograms/kg.

  **Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia for longer procedures**
  - By intravenous infusion

  - Neonate: Initially 10–50 micrograms/kg, dose to be administered over 10 minutes, followed by 30–60 micrograms/kg/hour.

  - Child: Initially 50–100 micrograms/kg, dose to be administered over 10 minutes, followed by 30–120 micrograms/kg/hour, usual dose with intravenous anaesthetic, 60 micrograms/kg/hour.
Remifentanil

**INDICATIONS AND DOSE**

Analgesia and enhancement of anaesthesia at induction (initial bolus injection)

- **BY INTRAVENOUS INJECTION**
  - Child 12-17 years: Initially 0.25–1 microgram/kg, dose to be administered over at least 30 seconds, if child is to be intubated more than 8 minutes after start of intravenous infusion, initial bolus intravenous injection dose is not necessary

Analgesia and enhancement of anaesthesia at induction with or without initial bolus dose

- **BY INTRAVENOUS INJECTION**
  - Child 12-17 years: 30–60 micrograms/kg/hour, if child is to be intubated more than 8 minutes after start of intravenous infusion, initial bolus intravenous injection dose is not necessary

Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia (initial bolus injection)

- **BY INTRAVENOUS INJECTION**
  - Child 1 month-11 years: Initially 0.1–1 microgram/kg, dose to be administered over at least 30 seconds (omitted if not required)
  - Child 12-17 years: Initially 0.1–1 microgram/kg, dose to be administered over at least 30 seconds (omitted if not required)

Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia with or without initial bolus dose

- **BY INTRAVENOUS INFUSION**
  - Neonate: 24–60 micrograms/kg/hour, additional doses of 1 microgram/kg can be given by intravenous injection during the intravenous infusion.

  - Child 1 month-11 years: 3–78 micrograms/kg/hour, dose to be administered according to anaesthetic technique and adjusted according to response, additional doses can be given by intravenous injection during the intravenous infusion

  - Child 12-17 years: 3–120 micrograms/kg/hour, dose to be administered according to anaesthetic technique and adjusted according to response, additional doses can be given by intravenous injection during the intravenous infusion

Spontaneous respiration: analgesia and enhancement of anaesthesia during maintenance of anaesthesia

- **BY INTRAVENOUS INJECTION**
  - Child 12-17 years: Initially 2.4 micrograms/kg/hour, adjusted according to response; usual dose 1.5–6 micrograms/kg/hour

**DOSES AT EXTREMES OF BODY-WEIGHT**

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

- **UNLICENSED USE** Not licensed for use in children under 1 year.
- **CONTRA-INDICATIONS** Analgesia in conscious patients
- **INTERACTIONS** → Appendix 1: opioids
- **SIDE-EFFECTS**
  - Common or very common Hypertension
  - Uncommon Hypoxia
  - Rare Asystole
  - Frequency not known AV block - convulsions

**SIDE-EFFECTS, FURTHER INFORMATION**

Muscle rigidity Alfentanil can cause muscle rigidity, particularly of the chest wall or jaw; this can be managed by the use of neuromuscular blocking drugs.

- **Respiratory depression** In contrast to other opioids which are metabolised in the liver, remifentanil undergoes rapid metabolism by non-specific blood and tissue esterases; its short duration of action allows prolonged administration at high dosage, without accumulation, and with little risk of residual postoperative respiratory depression.
- **PREGNANCY** No information available.
- **BREAST FEEDING** Avoid breast-feeding for 24 hours after administration—present in milk in animal studies.
- **RENAL IMPAIRMENT** No dose adjustment necessary in renal impairment.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous injection, reconstitute to a concentration of 1 mg/mL; for continuous intravenous infusion, dilute further with Glucose 5% or Sodium Chloride 0.9% to a concentration of 20–25 micrograms/mL for child 1–12 years or 20–250 micrograms/mL (usually 50 micrograms/mL) for child 12–18 years.

**PRESCRIBING AND DISPENSING INFORMATION**

Remifentanil should not be given by intravenous injection intra-operatively, but it is well suited to continuous infusion; a supplementary analgesic is given before stopping the infusion of remifentanil.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

- **Remifentanil (Non-proprietary)**
  - Remifentanil (as Remifentanyl hydrochloride) 1 mg
    - Remifentanil 1mg powder for concentrate for solution for injection vials
      - 5 vial [Pack] £25.58–£25.60 (Hospital only) [CD2]
    - Remifentanil (as Remifentanyl hydrochloride) 2 mg
      - Remifentanil 2mg powder for concentrate for solution for injection vials
      - 5 vial [Pack] £51.13–£51.15 (Hospital only) [CD2]
    - Remifentanil (as Remifentanyl hydrochloride) 5 mg
      - Remifentanil 5mg powder for concentrate for solution for injection vials
      - 5 vial [Pack] £127.88–£127.90 (Hospital only) [CD2]

- **Ultiva** (GlaxoSmithKline UK Ltd)
  - Remifentanil (as Remifentanyl hydrochloride) 1 mg
    - Ultiva 1mg powder for solution for injection vials
    - 5 vial [Pack] £25.58 (Hospital only) [CD2]
  - Remifentanil (as Remifentanyl hydrochloride) 2 mg
    - Ultiva 2mg powder for solution for injection vials
    - 5 vial [Pack] £51.13 (Hospital only) [CD2]
  - Remifentanil (as Remifentanyl hydrochloride) 5 mg
    - Ultiva 5mg powder for solution for injection vials
    - 5 vial [Pack] £127.88 (Hospital only) [CD2]

| 1.4 Peri-operative sedation |

**Conscious sedation for clinical procedures**

**Overview**

Sedation of children during diagnostic and therapeutic procedures is used to reduce fear and anxiety, to control pain, and to minimise excessive movement. The choice of sedative drug will depend upon the intended procedure and whether the child is cooperative; some procedures are safer and more successful under anaesthesia.

Midazolam p. 215 and chloral hydrate p. 282 are suitable for sedating children for painless procedures, such as imaging. For painful procedures, alternative choices include nitrous oxide p. 777, local anaesthesia, ketamine p. 790, or concomitant use of sedation with opioid or non-opioid analgesia.
Ketamine

**INDICATIONS AND DOSE**

**Induction and maintenance of anaesthesia for short procedures**
- **BY INTRAMUSCULAR INJECTION**
  - Neonate: 4 mg/kg, adjusted according to response, a dose of 4 mg/kg usually produces 15 minutes of surgical anaesthesia
  - Child: 4–13 mg/kg, adjusted according to response, a dose of 4 mg/kg usually produces 12–25 minutes of surgical anaesthesia
  - **BY INTRAVENOUS INJECTION**
  - Neonate: 1–2 mg/kg, adjusted according to response, to be given over at least 60 seconds, a dose of 1–2 mg/kg produces 5–10 minutes of surgical anaesthesia
  - Child 1 month–11 years: 1–2 mg/kg, adjusted according to response, to be given over at least 60 seconds, a dose of 1–2 mg/kg produces 5–10 minutes of surgical anaesthesia
  - Child 12–17 years: 1–4.5 mg/kg, adjusted according to response, to be given over at least 60 seconds, a dose of 2 mg/kg usually produces 5–10 minutes of surgical anaesthesia

**Induction and maintenance of anaesthesia for long procedures**
- **INITIALLY BY INTRAVENOUS INJECTION**
  - Neonate: Initially 0.5–2 mg/kg, followed by (by continuous intravenous infusion) 8 micrograms/kg/minute, adjusted according to response, doses up to 30 micrograms/kg/minute may be used to produce deep anaesthesia.
  - Child: Initially 0.5–2 mg/kg, followed by (by continuous intravenous infusion) 10–45 micrograms/kg/minute, adjusted according to response.

**Sedation prior to invasive or painful procedures**
- **BY INTRAVENOUS INJECTION**
  - Child: 1–2 mg/kg for 1 dose

### IMPORTANT SAFETY INFORMATION

Ketamine should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- **CONTRA-INDICATIONS**
  - Acute porphyrias p. 577
  - eclampsia
  - head trauma
  - hypertension
  - pre-eclampsia
  - raised intracranial pressure
  - severe cardiac disease
  - stroke

- **CAUTIONS**
  - Acute circulatory failure (shock)
  - cardiovascular disease
  - dehydration
  - fixed cardiac output
  - hallucinations
  - head injury
  - hypertension
  - hypovolaemia
  - increased cerebrospinal fluid pressure
  - intracranial mass lesions
  - nightmares
  - predisposition to seizures
  - psychotic disorders
  - raised intra-ocular pressure
  - respiratory tract infection
  - thyroid dysfunction

- **INTERACTIONS**
  - Appendix 1: ketamine

- **SIDE-EFFECTS**
  - **Common or very common**
    - Diplopia
    - hallucinations
    - hypertension
    - nausea
    - nightmares
    - nystagmus
    - rash
    - tachycardia
    - transient psychotic effects
    - vomiting
  - **Uncommon**
    - Arrhythmias
    - bradycardia
    - hypotension
    - laryngospasm
    - respiratory depression
  - **Rare**
    - Apnoea
    - cystitis
    - cystitis
    - haemorrhagic cystitis
    - hypersalivation
    - insomnia
  - **Frequency not known**
    - Raised intra-ocular pressure

### SIDE-EFFECTS, FURTHER INFORMATION

- Transient psychotic effects
  - Incidence of hallucinations, nightmares, and other transient psychotic effects can be reduced by a benzodiazepine such as diazepam or midazolam.
- **PREGNANCY**
  - May depress neonatal respiration if used during delivery.
- **BREAST FEEDING**
  - Avoid for at least 12 hours after last dose.
- **HEPATIC IMPAIRMENT**
  - Consider dose reduction.
- **DIRECTIONS FOR ADMINISTRATION**
  - For *intravenous injection*, dilute 100 mg/mL strength to a concentration of not more than 50 mg/mL with Glucose 5% or Sodium Chloride 0.9%. For *continuous intravenous infusion*, dilute to a concentration of 1 mg/mL with Glucose 5% or Sodium Chloride 0.9%; use microdrip infusion for maintenance of anaesthesia.
- **PATIENT AND CARER ADVICE**
  - **Driving and skilled tasks**
    - Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to *at least 24 hours* after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.
  - For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including ketamine, see Drugs and driving under Guidance on prescribing p. 1.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Solution for injection**

- **Ketamine (Non-proprietary)**
  - Ketamine (as Ketamine hydrochloride) 10 mg per 1 ml
    - Ketamin 10 Curamed 50mg/5ml solution for injection ampoules |
    - 10 ampoule (Poo) no price available (CD) |
  - Ketamine (as Ketamine hydrochloride) 50 mg per 1 ml
    - Ketamine 500mg/10ml solution for injection vials |
    - 10 vial (Poo) £70.00 (CD) |
    - Ketamin 100mg/2ml solution for injection ampoules |
    - 10 ampoule (Poo) no price available (CD) |
  - **Ketalar (Pfizer Ltd)**
    - Ketalar (as Ketamine hydrochloride) 10 mg per 1 ml
      - Ketalar 200mg/20ml solution for injection vials |
      - 1 vial (Poo) £5.06 (Hospital only) (CD) |
    - Ketalar (as Ketamine hydrochloride) 50 mg per 1 ml
      - Ketalar 500mg/10ml solution for injection vials |
      - 1 vial (Poo) £8.77 (Hospital only) (CD)

### HYPNOTICS, SEDATIVES AND ANXIOLYTICS > BENZODIAZEPINES

#### Temazepam

**INDICATIONS AND DOSE**

**Premedication before surgery or investigatory procedures**
- **BY MOUTH**
  - Child 12–17 years: 10–20 mg, to be taken 1 hour before procedure

- **UNLICENSED USE**
  - Tablets not licensed for use in children.

- **CONTRA-INDICATIONS**
  - CNS depression
  - compromised airway
  - hyperkinesia
  - obsessional state
  - phobic states
  - respiratory depression

- **CAUTIONS**
  - Hypoalbuginaemia
  - muscle weakness
  - organic brain changes
  - personality disorder (within the fearful
group—dependent, avoidant, obsessive-compulsive)—may increase risk of dependence

**CAUTIONS, FURTHER INFORMATION**

- **Paradoxical effects** A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggression and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

**INTERACTIONS** → Appendix 1: temazepam

**SIDE-EFFECTS**

- **Common or very common** Amnesia, ataxia, confusion, dependence, drowsiness the next day, lightheadedness the next day, muscle weakness, paradoxical increase in aggression.
- **Uncommon** Dizziness, dysarthria, gastro-intestinal disturbances, gynaecomastia, incontinence, salivation changes, tremor, visual disturbances.
- **Rare** Apnoea, blood disorders, changes in libido, headache, hypotension, jaundice, skin reactions, urinary retention, vertigo.
- **Frequency not known** Delusions, excitement, hallucinations, irritability, psychosis, respiratory depression (may be marked when used for sedation; facilities for its treatment are essential), restlessness.

**BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

**HEPATIC IMPAIRMENT** Start with smaller initial doses or reduce dose. Can precipitate coma. Avoid in severe impairment.

**RENAL IMPAIRMENT** Start with small doses in severe impairment.

**PATIENT AND CARER ADVICE**

**Driving and skilled tasks** May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day.

Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned of the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day.

Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned of the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

**Oral solution**

**CAUTIONARY AND ADVISORY LABELS** 19

- Temazepam (Non-proprietary)
  - Temazepam 2 mg per 1 ml Temazepam 10mg/5ml oral solution sugar free sugar-free | 300 ml (Pent) £121.08 DT price = £121.08 C03
  - **Tablet**

**CAUTIONARY AND ADVISORY LABELS** 19

- Temazepam (Non-proprietary)
  - Temazepam 10 mg Temazepam 10mg tablets | 28 tablet (Pent): £35.00 DT price = £1.89 C03 | 500 tablet (Pent): £624.82 C03
  - Temazepam 20 mg Temazepam 20mg tablets | 28 tablet (Pent): £35.00 DT price = £1.91 C03 | 250 tablet (Pent): £307.94 C03

**2 Malignant hyperthermia**

**MUSCLE RELAXANTS > DIRECTLY ACTING**

**Dantrolene sodium**

**DRUG ACTION** Acts on skeletal muscle cells by interfering with calcium efflux, thereby stopping the contractile process.

**INDICATIONS AND DOSE**

**Malignant hyperthermia**

- **By rapid intravenous injection**
  - **Child**: Initially 2–3 mg/kg, then 1 mg/kg, repeated if necessary; maximum 10 mg/kg per course.

**Chronic severe spasticity of voluntary muscle**

- **By mouth**
  - **Child 5-11 years**: Initially 500 micrograms/kg once daily for 7 days, then increased to 500 micrograms/kg dose 3 times a day, then increased in steps of 500 micrograms/kg dose every 7 days (max. per dose 2 mg/kg 3–4 times a day) until satisfactory response; maximum 400 mg per day.
  - **Child 12–17 years**: Initially 25 mg once daily for 7 days, then increased to 25 mg 3 times a day, then increased in steps of 500 micrograms/kg dose every 7 days (max. per dose 2 mg/kg 3–4 times a day) until satisfactory response; maximum 400 mg per day.

**UNLICENSED USE** Not licensed for use in children.

**IMPORTANT SAFETY INFORMATION**

Should only be administered by, or under the direct supervision of, personnel experienced in the use of dantrolene when used for malignant hyperthermia.

**CONTRA-INDICATIONS**

- With oral use Acute muscle spasm - avoid when spasticity is useful, for example, locomotion.

**CAUTIONS**

- With intravenous use Avoid extravasation (risk of tissue necrosis).
- With oral use Females (hepatotoxicity) - history of liver disorders (hepatotoxicity) - if doses greater than 400 mg daily (hepatotoxicity) - impaired cardiac function - impaired pulmonary function - therapeutic effect may take a few weeks to develop—discontinue if no response within 6–8 weeks.

**INTERACTIONS** → Appendix 1: dantrolene

**SIDE-EFFECTS**

- **Common or very common** Confusion, constipation, crystalluria, depression, dysphagia, dyspnoea, erratic blood pressure, exacerbation of cardiac insufficiency, haematuria, increased sweating, increased urinary frequency, insomnia, nervousness, tachycardia, urinary incontinence, urinary retention.
- **Frequency not known**
  - With intravenous use Dizziness, erythema, hepatotoxicity, injection-site reactions, pulmonary oedema, rash, swelling, thrombophlebitis, weakness.
**Local anaesthesia**

**Local anaesthetic drugs**

The use of local anaesthetics by injection or by application to mucous membranes to produce local analgesia is discussed in this section.

Local anaesthetic drugs act by causing a reversible block to conduction along nerve fibres. They vary widely in their potency, toxicity, duration of action, stability, solubility in water, and ability to penetrate mucous membranes. These factors determine their application, e.g. topical (surface), infiltration, peripheral nerve block, intravenous regional anaesthesia (Bier’s block), plexus, epidural (extradural), or spinal (intrathecal or subarachnoid) block. Local anaesthetics may also be used for postoperative pain relief, thereby reducing the need for analgesics such as opioids.

Bupivacaine hydrochloride p. 794 has a longer duration of action than other local anaesthetics. It has a slow onset of action, taking up to 30 minutes for full effect. It is often used in lumbar epidural blockade and is particularly suitable for continuous epidural analgesia in labour, or for postoperative pain relief. It is the principal drug used for spinal anaesthesia. Hyperbaric solutions containing glucose may be used for spinal block.

Levobupivacaine p. 795, an isomer of bupivacaine hydrochloride, has anaesthetic and analgesic properties similar to bupivacaine hydrochloride, but is thought to have fewer adverse effects.

Lidocaine hydrochloride p. 796 is effectively absorbed from mucous membranes and is a useful surface anaesthetic in concentrations up to 10%. Except for surface anaesthesia and dental anaesthesia, solutions should not usually exceed 1% in strength. The duration of the block (with adrenaline/epinephrine p. 132) is about 90 minutes.

Application of a mixture of lidocaine and prilocaine (EMLA®) under an occlusive dressing provides surface anaesthesia for 1–2 hours. EMLA® does not appear to be effective in providing local anaesthesia for heel lancing in neonates.

Prilocaine hydrochloride p. 800 is a local anaesthetic of low toxicity which is similar to lidocaine hydrochloride.

Ropivacaine hydrochloride p. 800 is an amide-type local anaesthetic agent similar to bupivacaine hydrochloride. It is less cardiotoxic than bupivacaine hydrochloride, but also less potent.

Tetracaine p. 801, a para-aminobenzoic acid ester, is an effective local anaesthetic for topical application; a 4% gel is indicated for anaesthesia before venepuncture or venous cannulation. Tetracaine is effective for 4–6 hours after a single application in most children. It is not recommended prior to neonatal heel lancing.

Tetracaine is rapidly absorbed from mucous membranes and should never be applied to inflamed, traumatised, or highly vascular surfaces. It should never be used to provide anaesthesia for bronchoscopy or cystoscopy because lidocaine hydrochloride is a safer alternative.

**Administration by injection**

The dose of local anaesthetic depends on the injection site and the procedure used. In determining the safe dosage, it is important to take account of the rate of absorption and excretion, and of the potency. The child’s age, weight, physique, and clinical condition, and the vascularity of the administration site and the duration of administration, must also be considered.

Uptake of local anaesthetics into the systemic circulation determines their duration of action and produces toxicity. NHS Improvement has advised (September 2016) that, prior to administration, all injectable medicines must be drawn directly from their original ampoule or container into a syringe and should never be decanted into gallipots or open containers. This is to avoid the risk of medicines being confused with other substances, e.g. skin disinfectants, and to reduce the risk of contamination.

Great care must be taken to avoid inadvertent intravascular injection; local anaesthetic injections should be given slowly in order to detect inadvertent intravascular administration. When prolonged analgesia is required, a long-acting local anaesthetic is preferred to minimise the likelihood of cumulative systemic toxicity. Local anaesthesia around the oral cavity may impair swallowing and therefore increases the risk of aspiration.

Epidural anaesthesia is combined with general anaesthesia for certain surgical procedures in children.

**Use of vasoconstrictors**

Local anaesthetics cause dilatation of blood vessels. The addition of a vasoconstrictor such as adrenaline/epinephrine to the local anaesthetic preparation diminishes local blood flow, slowing the rate of absorption and thereby prolonging the anaesthetic effect. Great care should be taken to avoid inadvertent intravenous administration of a preparation.
containing adrenaline/epinephrine, and it is not advisable to
give adrenaline/epinephrine with a local anaesthetic
injection in digits or appendages because of the risk of
ischaemic necrosis.

Adrenaline/epinephrine must be used in a low
concentration when administered with a local anaesthetic.
Care must also be taken to calculate a safe maximum dose of
local anaesthetic when using combination products.

In children with severe hypertension or unstable cardiac
rhythm, the use of adrenaline/epinephrine with a local
anaesthetic may be hazardous. For these children an
anaesthetic without adrenaline/epinephrine should be used.

Dental anaesthesia
Lidocaine hydrochloride is widely used in dental procedures;
it is most often used in combination with
adrenaline/epinephrine. Lidocaine hydrochloride 2% combined
with adrenaline/epinephrine 1 in 80 000
(12.5 micrograms/mL) is a safe and effective preparation;
there is no justification for using higher concentrations of
adrenaline/epinephrine. The amide-type local anaesthetics
articaine and mepivacaine hydrochloride p. 799 are also used
in dentistry; they are available in cartridges suitable for
dental use. Mepivacaine hydrochloride is available with or
without adrenaline/epinephrine, and articaine is available
with adrenaline/epinephrine. In children with severe
hypertension or unstable cardiac rhythm, mepivacaine
hydrochloride without adrenaline/epinephrine may be used.
Alternatively, prilocaine hydrochloride with or without
felypressin can be used but there is no evidence that it is any
safer. Felypressin can cause coronary vasoconstriction when
used at high doses; limit dose in children with coronary
artery disease.

Toxicity
For management of toxicity see Severe local anaesthetic-
induced cardiovascular toxicity below.

Severe local anaesthetic-induced
cardiovascular toxicity

Overview
After injection of a bolus of local anaesthetic, toxicity may
develop at any time in the following hour. In the event of
signs of toxicity during injection, the administration of the
local anaesthetic must be stopped immediately.

Cardiovascular status must be assessed and
cardiopulmonary resuscitation procedures must be followed.

In the event of local anaesthetic-induced cardiac arrest,
standard cardiopulmonary resuscitation should be initiated
immediately. Lidocaine must not be used as anti-arrhythmic
therapy.

If the patient does not respond rapidly to standard
procedures, 20% lipid emulsion such as Intralipid®
[unlicensed indication] should be given intravenously at an
initial bolus dose of 1.5 mL/kg over 1 minute, followed by an
infusion of 15 mL/kg/hour. After 5 minutes, if cardiovascular
stability has not been restored or circulation deteriorates,
give a maximum of two further bolus doses of 1.5 mL/kg over
1 minute, 5 minutes apart, and increase the infusion rate to
30 mL/kg/hour. Continue infusion until cardiovascular
stability and adequate circulation are restored or maximum
cumulative dose of 12 mL/kg is given.

Standard cardiopulmonary resuscitation must be
maintained throughout lipid emulsion treatment.

Propofol is not a suitable alternative to lipid emulsion.
Further advice on ongoing treatment should be obtained
from the National Poisons Information Service.

Detailed treatment algorithms and accompanying notes
are available at www.toxbase.org or can be found in the

Association of Anaesthetists of Great Britain and Ireland safety
guideline, Management of Severe Local Anaesthetic Toxicity and
Management of Severe Local Anaesthetic Toxicity – Accompanying
notes.

ANAESTHETICS, LOCAL

Adrenaline with articaine
hydrochloride

(Carticaine hydrochloride with epinephrine)

INDICATIONS AND DOSE

Infiltration anaesthesia in dentistry

BY REGIONAL ADMINISTRATION

• Child 4–17 years: Consult expert dental sources

DOSES AT EXTREMES OF BODY-WEIGHT

To avoid excessive dosage in obese patients, dose should
be calculated on the basis of ideal body-weight.

IMPORTANT SAFETY INFORMATION

Should only be administered by, or under the direct
supervision of, personnel experienced in their use, with
adequate training in anaesthesia and airway
management, and should not be administered
parenterally unless adequate resuscitation equipment is
available.

Adrenaline/epinephrine must be used in a low
concentration when administered with a local
anaesthetic. The total dose of adrenaline should not
exceed 5 micrograms/kg (1 mL/kg of a 1 in 200 000
solution) and it is essential not to exceed a
concentration of 1 in 200 000 (5 micrograms/mL) if more
than 50 mL of the mixture is to be injected.

CONTRA-INDICATIONS

Application to damaged skin - application to the middle ear (may cause ototoxicity) - complete heart block - injection into inflamed tissues - preparations containing preservatives should not be used for caudal, epidural, or
spinal block, or for intravenous regional anaesthesia
(Bier’s block)

CONTRA-INDICATIONS, FURTHER INFORMATION

Injection site Local anaesthetics should not be injected into
inflamed or infected tissues nor should they be applied to
damaged skin. Increased absorption into the blood
increases the possibility of systemic side-effects, and the
local anaesthetic effect may also be reduced by altered
local pH.

CAUTIONS

Arrhythmias - cardiovascular disease - cerebrovascular disease - children (consider dose
reduction) - cor pulmonale - debilitated patients (consider
do se reduction) - diabetes mellitus - epilepsy -
hypercalcaemia - hyperreflexia - hypertension -
hyperthyroidism - hypokalaemia - hypovolaemia - impaired
cardiac conduction - impaired respiratory function -
ischaemic heart disease - myasthenia gravis - obstructive
cardiomyopathy - occlusive vascular disease - organic brain
damage - phaeochromocytoma - prostate disorders -
psychoneurosis - severe angina - shock - susceptibility to
angle-closure glaucoma

CAUTIONS, FURTHER INFORMATION

Use of vasoconstrictor s In patients with severe hypertension
or unstable cardiac rhythm, the use of adrenaline with a
local anaesthetic may be hazardous. For these patients an
anaesthetic without adrenaline should be used.

INTERACTIONS

• Appendix 1: articaine, sympathomimetics, vasoconstrictor

SIDE-EFFECTS

Angina - angle-closure glaucoma - anorexia -
anxiety - arrhythmias - blurred vision - cardiac arrest - cold
extremities • confusion • convulsions • difficulty in micturition • dizziness • drowsiness • dry mouth • dyspnoea • feeling of inebriation • headache • hyperglycaemia • hypersalivation • hypertension (risk of cerebral haemorrhage) • hypokalaemia • insomnìa • lightheadedness • metabolic acidosis • methaemoglobinæmia • muscle twitching • mydriasis • myocardial depression (resulting in hypotension and bradycardia) • myocardial infarction • nausea • numbness of the tongue and perioral region • pallor • palpitation • paraesthesia (including sensations of hot and cold) • peripheral vasodilatation (resulting in hypotension and bradycardia) • psychosis • pulmonary oedema (on excessive dosage or extreme sensitivity) • restlessness • sweating • tachycardia • tinnitus • tissue necrosis at injection site and of extremities,bowel, liver and kidneys • transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) • tremor • urinary retention • vomiting • weakness

SIDE-EFFECTS, FURTHER INFORMATION

> Toxic effects Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection. Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection. The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

ALLERGY AND CROSS-SENSITIVITY

Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

PREGNANCY Use only if potential benefit outweighs risk—no information available.

BREAST FEEDING Avoid breast-feeding for 48 hours after administration.

HEPATIC IMPAIRMENT Use with caution; increased risk of side-effects in severe impairment.

RENAL IMPAIRMENT Manufacturers advise use with caution in severe impairment.

MONITORING REQUIREMENTS Consider monitoring blood pressure and ECG (advised with systemic adrenaline/epinephrine).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Sulfites

> Septanest (Septodont Ltd)
  Adrenaline (as Adrenaline acid tartrate) 10 microgram per 1 ml, Articaine hydrochloride 40 mg per 1 ml Septanest 1 in 100,000 solution for injection cartridges | 50 cartridge | price | no price available
  Adrenaline (as Adrenaline acid tartrate) 5 microgram per 1 ml, Articaine hydrochloride 40 mg per 1 ml Septanest 1 in 200,000 solution for injection cartridges | 50 cartridge | price | no price available

Bupivacaine hydrochloride

INDICATIONS AND DOSE

Surgical anaesthesia | Acute pain

> BY REGIONAL ADMINISTRATION
  Child: Doses adjusted according to child’s physical status and nature of procedure, seek expert advice (consult product literature or local protocols)

DOSES AT EXTREMES OF BODY-WEIGHT

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

IMPORTANT SAFETY INFORMATION

The licensed doses stated may not be appropriate in some settings and expert advice should be sought. Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

CONTRA-INDICATIONS Application to the middle ear (can cause ototoxicity) • avoid injection into infected tissues • avoid injection into inflamed tissues • complete heart block • preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier’s block) • should not be applied to damaged skin

CONTRA-INDICATIONS, FURTHER INFORMATION

Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

CAUTIONS Cardiovascular disease • cerebral atheroma • children (consider dose reduction) • debilitated patients (consider dose reduction) • epilepsy • hypertension • hypotension • hypovolaemia • impaired cardiac conduction • impaired respiratory function • myasthenia gravis • myocardial depression may be more severe and more resistant to treatment • shock

INTERACTIONS | Appendix 1: anaesthetics, local

SIDE-EFFECTS Arrhythmias • blurred vision • cardiac arrest • convulsions • dizziness • drowsiness • feeling of inebriation • headache • lightheadedness • muscle twitching • myocardial depression (resulting in hypotension and bradycardia) • nausea • numbness of the tongue and perioral region • paraesthesia (including sensations of hot and cold) • peripheral vasodilatation (resulting in hypotension and bradycardia) • restlessness • tinnitus • transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) • tremors • vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Toxic effects Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection. Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection.

The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

ALLERGY AND CROSS-SENSITIVITY

Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and...
chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- **PREGNANCY** Use lower doses for intrathecal use during late pregnancy. Large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidual block.
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Use with caution in severe impairment.
- **RENAL IMPAIRMENT** Use with caution in severe impairment.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion, solution for infusion

### Solution for injection

- **Bupivacaine hydrochloride (Non-proprietary)**
  - Bupivacaine hydrochloride 2.5 mg per 1 ml Bupivacaine 0.25% solution for injection 10ml Sure-Amp ampoules | 20 ampoule £17.50
  - Bupivacaine hydrochloride 5 mg per 1 ml Bupivacaine 0.5% solution for injection 10ml Sure-Amp ampoules | 20 ampoule £18.30
  - Bupivacaine 50mg/10ml (0.5%) solution for injection ampoules | 10 ampoule £1.00 no price available
- **Marcain (Aspen Pharma Trading Ltd)**
  - Bupivacaine hydrochloride 2.5 mg per 1 ml Marcain 0.25% solution for injection 10ml Polypamp Steripack ampoules | 5 ampoule £7.92
  - Bupivacaine hydrochloride 5 mg per 1 ml Marcain 0.5% solution for injection 10ml Polypamp Steripack ampoules | 5 ampoule £9.25

### Infusion

- **Bupivacaine hydrochloride (Non-proprietary)**
  - Bupivacaine hydrochloride 1 mg per 1 ml Bupivacaine 0.1% infusion bags | 20 bag £1.94 no price available
  - Bupivacaine 250mg/250ml (0.1%) infusion bags | 20 bag £0.30 no price available
  - Bupivacaine hydrochloride 1.25 mg per 1 ml Bupivacaine 312.5mg/250ml (0.125%) infusion bags | 20 bag £0.30 no price available

### Levobupivacaine

- **INDICATIONS AND DOSE**
  - **Surgical anaesthesia** | **Acute pain**
    - By regional administration
    - Child: Doses adjusted according to child’s physical status and nature of procedure, seek expert advice (consult product literature or local protocols)
  - **DOSES AT EXTREMES OF BODY-WEIGHT**
    - To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

- **UNLICENSED USE** Not licensed for use in children except for analgesia by ilioinguinal or iliohypogastric block.

### Bupivacaine with adrenaline

The properties listed below are those particular to the combination only. For the properties of the components please consider, bupivacaine hydrochloride p. 794, adrenaline/epinephrine p. 132.

- **INDICATIONS AND DOSE**
  - **Surgical anaesthesia**
    - By lumbar epidural, or by local infiltration, or by caudal epidural
  - **Acute pain management**
    - By lumbar epidural, or by local infiltration
  - Child 12-17 years: (consult product literature)
  - Child 1-7 years: (consult product literature)

### IMPORTANT SAFETY INFORMATION

Adrenaline/epinephrine must be used in a low concentration when administered with a local anaesthetic. The total dose of adrenaline should not exceed 5 micrograms/kg (1 mL/kg of a 1 in 200 000 solution) and it is essential not to exceed a concentration of 1 in 200 000 (5 micrograms/mL) if more than 50 mL of the mixture is to be injected.

- **CAUTIONS**
  - **CAUTIONS, FURTHER INFORMATION**
    - In patients with severe hypertension or unstable cardiac rhythm, the use of adrenaline with a local anaesthetic may be hazardous. For these patients an anaesthetic without adrenaline should be used.

### Solution for injection

- **Bupivacaine with adrenaline (Non-proprietary)**
  - Adrenaline (as Adrenaline acid tartrate) 5 microgram per 1 ml, Bupivacaine hydrochloride 2.5 mg per 1 ml Bupivacaine 25mg/10ml (0.25%) / Adrenaline (base) 50micrograms/10ml (1 in 200,000) solution for injection ampoules | 10 ampoule £4.00
  - Adrenaline (as Adrenaline acid tartrate) 5 microgram per 1 ml, Bupivacaine hydrochloride anhydrous 2.5 mg per 1 ml Carbostesin-adrenaline 0.25% / 100micrograms/20ml (1 in 200,000) solution for injection ampoules | 1 ampoule £0.10 no price available
  - Carbostesin-adrenaline 0.25% / 25micrograms/5ml (1 in 200,000) solution for injection ampoules | 1 ampoule £0.10 no price available
  - Adrenaline (as Adrenaline acid tartrate) 5 microgram per 1 ml, Bupivacaine hydrochloride 5 mg per 1 ml Bupivacaine 50mg/10ml (0.5%) / Adrenaline (base) 10micrograms/10ml (1 in 200,000) solution for injection ampoules | 10 ampoule £0.50
  - Adrenaline (as Adrenaline acid tartrate) 5 microgram per 1 ml, Bupivacaine hydrochloride anhydrous 5 mg per 1 ml Carbostesin-adrenaline 0.5% / 25micrograms/5ml (1 in 200,000) solution for injection ampoules | 1 ampoule £0.10 no price available
  - Carbostesin-adrenaline 0.5% / 100micrograms/20ml (1 in 200,000) solution for injection ampoules | 1 ampoule £0.10 no price available
local anaesthetic effect may also be reduced by altered local pH.

- **CAUTIONS** Cardiovascular disease · children (consider dose reduction) · debilitated patients (consider dose reduction) · epilepsy · hypovolaemia · impaired cardiac conduction · impaired respiratory function · myasthenia gravis · shock

- **INTERACTIONS** → Appendix 1: anaesthetics, local

- **SIDE-EFFECTS** Anaemia · arrhythmias · blurred vision · cardiac arrest · convulsions · dizziness · drowsiness · feeling of inebriation · headache · light-headedness · muscle twitching · myocardial depression (resulting in hypotension and bradycardia) · nausea · numbness of the tongue and perioral region · paraesthesia (including sensations of hot and cold) · peripheral vasodilatation (resulting in hypotension and bradycardia) · pyrexia · restlessness · sweating · tinnitus · transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) · tremors · vomiting

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Toxic effects Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection.
  - Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection.
  - The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

- **ALLERGY AND CROSS-SENSITIVITY**
  - Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- **PREGNANCY**
  - Large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block. Avoid if possible in the first trimester—toxicity in animal studies. May cause fetal distress syndrome. Do not use for paracervical block in obstetrics. Do not use 7.5 mg/mL strength in obstetrics.

- **BREAST FEEDING**
  - Amount too small to be harmful.

- **HEPATIC IMPAIRMENT** Use with caution.

- **DIRECTIONS FOR ADMINISTRATION** For 1.25 mg/mL concentration dilute standard solutions with sodium chloride 0.9%.

- **PREScribing AND DISPENSING INFORMATION**
  - Levobupivacaine is an isomer of bupivacaine.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Chirocaine (AbbVie Ltd)
  - Levobupivacaine (as Levobupivacaine hydrochloride) 2.5 mg per 1 ml Chirocaine 25mg/10ml solution for injection ampoules | 10 ampoule (PoM) £14.11 (Hospital only)

  - **Child:** Seek expert advice

**Pain relief (in anal fissures, haemorrhoids, pruritus ani, pruritus vulvae, herpes zoster, or herpes labialis)**

- **Lubricant in cystoscopy / Lubricant in proctoscopy**
  - **TO THE SKIN USING OINTMENT**
  - **Child:** Apply 1–2 mL as required, avoid long-term use

**LMX 4®**

**Anaesthesia before venous cannulation or venepuncture**

- **TO THE SKIN**
  - **Child 1–2 months:** Apply up to 1 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 60 minutes, remove cream with gauze and perform procedure after approximately 5 minutes
  - **Child 3–11 months:** Apply up to 1 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 4 hours, remove cream with gauze and perform procedure after approximately 5 minutes
  - **Child 1–7 years:** Apply 1–2.5 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 5 hours, remove cream with gauze and perform procedure after approximately 5 minutes

---

**IMPORTANT SAFETY INFORMATION**

- When used by local infiltration
  - The licensed doses stated may not be appropriate in some settings and expert advice should be sought. Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.
● CONTRA-INDICATIONS
  ▶ When used by regional administration Application to the middle ear (can cause ototoxicity) - avoid injection into infected tissues - avoid injection into inflamed tissues - preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier’s block) - should not be applied to damaged skin

CONTRA-INDICATIONS, FURTHER INFORMATION
  ▶ When used by regional administration Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

● CAUTIONS
  ▶ When used by regional administration Children (consider dose reduction) - debilitated patients (consider dose reduction) - epilepsy - hypovolaemia - impaired cardiac conduction - impaired respiratory function - myasthenia gravis - shock

● INTERACTIONS  ▶ Appendix 1: antiarrhythmics

● SIDE-EFFECTS
  ▶ Frequency not known
  ▶ When used by regional administration Transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) - arrhythmias - blurred vision - cardiac arrest - feeling of inebriation - headache - hypoglycaemia (following intrathecal or extradural administration) - methaemoglobinemia - muscle twitching - myocardial depression (resulting in hypotension and bradycardia) - nausea - numbness of the tongue and perioral region - nystagmus - peripheral vasodilatation (resulting in hypotension and bradycardia) - rash - restlessness - tinnitus - tremors - vomiting

SIDE-EFFECTS, FURTHER INFORMATION
  ▶ Topical application A single application of a topical lidocaine preparation does not generally cause systemic side-effects.

● Toxic effects
  ▶ When used by regional administration Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection. Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection. The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

● Methaemoglobinemia
  ▶ When used by regional administration Methaemoglobinemia can be treated with an intravenous injection of methylthioninium chloride; neonates and infants under 6 months are particularly susceptible to methaemoglobinemia.

● ALLERGY AND CROSS-SENSITIVITY
  Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, meptivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

● PREGNANCY
  Crosses the placenta but not known to be harmful in animal studies — use if benefit outweighs risk. When used as a local anaesthetic, large doses can cause fetal bradycardia; if given during delivery can also cause neonatal respiratory depression, hypotonia, or bradycardia after paracervical or epidural block.

● BREAST FEEDING
  Present in milk but amount too small to be harmful.

● HEPATIC IMPAIRMENT
  Caution—increased risk of side-effects.

● RENAL IMPAIRMENT
  Possible accumulation of lidocaine and active metabolite; caution in severe impairment.

● MONITORING REQUIREMENTS
  ▶ With systemic use Monitor ECG and have resuscitation facilities available.

● MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection
  ▶ Lidocaine hydrochloride (Non-proprietary)
    Lidocaine hydrochloride 5 mg per 1 ml Lidocaine 50mg/10ml (0.5%) solution for injection ampoules | 10 ampoule (Pom) £7.30
    Lidocaine hydrochloride 10 mg per 1 ml Lidocaine 100mg/10ml (1%) solution for injection ampoules | 20 ampoule (Pom) £10.89
    Lidocaine 100mg/10ml (1%) solution for injection ampoules | 10 ampoule (Pom) £4.40 DT price = £4.36
    Lidocaine 100mg/10ml (1%) solution for injection Sure-Amp ampoules | 20 ampoule (Pom) £8.80
    Lidocaine 200mg/20ml (1%) solution for injection vials | 10 vial (Pom) £19.00
    Lidocaine 200mg/20ml (1%) solution for injection ampoules | 10 ampoule (Pom) £7.00–£9.63 DT price = £9.63
    Lidocaine 50mg/5ml (1%) solution for injection ampoules | 10 ampoule (Pom) £2.57–£3.10 DT price = £2.57
    Lidocaine 50mg/5ml (1%) solution for injection ampoules | 20 ampoule (Pom) £5.40–£6.10 DT price = £5.40
    Lidocaine 50mg/5ml (1%) solution for injection Sure-Amp ampoules | 20 ampoule (Pom) £6.00
    Lidocaine hydrochloride 20 mg per 1 ml Lidocaine 100mg/5ml (2%) solution for injection ampoules | 10 ampoule (Pom) £2.67–£3.80 DT price = £2.67
    Lidocaine 400mg/20ml (2%) solution for injection ampoules | 10 ampoule (Pom) £19.50
    Lidocaine 200mg/10ml (2%) solution for injection ampoules | 20 ampoule (Pom) £1.12–£1.46 DT price = £1.46
    Lidocaine 1000mg/5ml (2%) solution for injection Sure-Amp ampoules | 20 ampoule (Pom) £6.00
    Lidocaine 400mg/20ml (2%) solution for injection ampoules | 10 ampoule (Pom) £8.00–£9.90 DT price = £9.90

Cream
EXCIPIENTS: May contain Benzyl alcohol, propylene glycol – LMX 4 (Ferndale Pharmaceuticals Ltd)
  Lidocaine 40 mg per 1 gram LMK 4 cream | 5 gram (P) £2.98 DT price = £2.98 | 30 gram (P) £14.90 DT price = £14.90

Ointment
  Lidocaine hydrochloride (Non-proprietary)
  Lidocaine hydrochloride 50 mg per 1 gram | 15 gram (P) £6.50 DT price = £6.18

Lidocaine with adrenaline
The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride p. 796, adrenaline/epinephrine p. 132.

INDICATIONS AND DOSE
Local anaesthesia
  ▶ BY LOCAL INfiltrATION
  ▶ Child 12–17 years: Dosed according to the type of nerve block required (consult product literature)

IMPORTANT SAFETY INFORMATION
Adrenaline/epinephrine must be used in a low concentration when administered with a local anaesthetic. The total dose of adrenaline should not exceed 5 micrograms/kg (1 mL/kg of a 1 in 200 000 solution) and it is essential not to exceed a
Lidocaine with prilocaine
The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride p. 796, prilocaine hydrochloride p. 800.

**INDICATIONS AND DOSE**

**Anaesthesia before minor skin procedures including venepuncture**

▶ TO THE SKIN

- Neonate: Apply up to 1 g for maximum 1 hour before procedure, to be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca); maximum 1 dose per day.

- Child 1–2 months: Apply up to 1 g for maximum 1 hour before procedure, to be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca); maximum 1 dose per day.

- Child 3–11 months: Apply up to 2 g for maximum 1 hour before procedure, to be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca); maximum 2 doses per day.

- Child 1–11 years: Apply 1–5 hours before procedure, a thick layer should be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca); maximum 2 doses per day.

- Child 12–17 years: Apply 1–5 hours before procedure (2–5 hours before procedures on large areas e.g. split skin grafting), a thick layer should be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca)

**Anaesthesia on genital skin before injection of local anaesthetics**

▶ TO THE SKIN

- Child 12–17 years: Apply under occlusive dressing for 15 minutes (males) or 60 minutes (females) before procedure.

**Anaesthesia before surgical treatment of lesions on genital mucosa**

▶ TO THE SKIN

- Child 12–17 years: Apply up to 10 g, to be applied 5–10 minutes before procedure, maximum dose should be proportionally reduced in adolescents with body-weight less than 20 kg

**Anaesthesia before cervical curettage**

▶ TO THE SKIN

- Child 12–17 years: Apply 10 g in lateral vaginal fornices for 10 minutes

**CONTRA-INDICATIONS** Use in child less than 37 weeks corrected gestational age

**INTERACTIONS** 

▶ Appendix 1: anaesthetics, local, antiarrhythmics

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: EMLA cream for local anaesthesia www.medicinesforchildren.org.uk/emla-cream-for-local-anaesthesia
Mepivacaine hydrochloride

**INDICATIONS AND DOSE**

**Infiltration anaesthesia and nerve block in dentistry**

- Child: 3-17 years: Consult expert dental sources

**DOSES AT EXTREMES OF BODY-WEIGHT**

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

**IMPORTANT SAFETY INFORMATION**

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

**CONTRA-INDICATIONS**

Application to the middle ear (can cause ototoxicity) - avoid injection into infected tissues - avoid injection into inflamed tissues - complete heart block - preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier’s block) - should not be applied to damaged skin

**CONTRA-INDICATIONS, FURTHER INFORMATION**

- Injection site: Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

**CAUTIONS**

Cardiovascular disease - children (consider dose reduction) - dehydrated patients (consider dose reduction) - epilepsy - hypovolaemia - impaired cardiac conduction - impaired respiratory function - myasthenia gravis - shock

**INTERACTIONS**

- Appendix 1: anaesthetics, local

**SIDE-EFFECTS**

Arrhythmias - blurred vision - cardiac arrest - convulsions - dizziness - drowsiness - feeling of inebriation - headache - lightheadedness - muscle twitching - myocardial depression (resulting in hypotension and bradycardia) - nausea - numbness of the tongue and perioral region - paraesthesia (including sensations of hot and cold) - peripheral vasodilatation (resulting in hypotension and bradycardia) - restlessness - tinnitus - transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) - tremors - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- Toxic effects: Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection. Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection.

- The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

**ALLERGY AND CROSS-SENSITIVITY**

Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

**PREGNANCY**

Use with caution in early pregnancy.

**BREAST FEEDING**

Use with caution.

**HEPATIC IMPAIRMENT**

Use with caution; increased risk of side-effects in severe impairment.

**RENAL IMPAIRMENT**

Use with caution; increased risk of side-effects.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Scandonest plain** (Deproco UK Ltd)
  - Mepivacaine hydrochloride 30 mg per 1 ml Scandonest plain 3% solution for injection 2.2 ml cartridges | 50 cartridge [POM] no price available

**Mepivacaine with adrenaline**

The properties listed below are those particular to the combination only. For the properties of the components please consider, mepivacaine hydrochloride above, adrenaline/epinephrine p. 132.

**INDICATIONS AND DOSE**

**Infiltration anaesthesia and nerve block in dentistry**

- By local infiltration
- Child: (consult product literature)

**IMPORTANT SAFETY INFORMATION**

Adrenaline/epinephrine must be used in a low concentration when administered with a local anaesthetic. The total dose of adrenaline should not exceed 5 micrograms/kg (1 mL/kg of a 1 in 200 000 solution) and it is essential not to exceed a concentration of 1 in 200 000 (5 micrograms/mL) if more than 50 mL of the mixture is to be injected.

**INTERACTIONS**

- Appendix 1: anaesthetics, local, sympathomimetics, vasoconstrictor

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Scandonest special** (Deproco UK Ltd)
  - Adrenaline 10 microgram per 1 mL, Mepivacaine hydrochloride 20 mg per 1 mL Scandonest special 2% solution for injection 2.2 ml cartridges | 50 cartridge [POM] no price available
Prilocaine hydrochloride

**INDICATIONS AND DOSE**

**CITANEST 1%**

**INfiltration anaesthesia | Nerve block**
- **BY REGIONAL ADMINISTRATION**
  - Child 6 months–11 years: Up to 5 mg/kg, dose adjusted according to site of administration and response; maximum 400 mg per course
  - Child 12–17 years: 100–200 mg/minute, alternatively, may be given in incremental doses; dose adjusted according to site of administration and response; maximum 400 mg per course

**DOSES AT EXTREMES OF BODY-WEIGHT**
To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

**IMPORTANT SAFETY INFORMATION**

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

**CONTRA-INDICATIONS**
Acquired methaemoglobinemia. anaemia, application to the middle ear (can cause otoxicity). Avoid injection into infected tissues. Avoid injection into inflamed tissues. Complete heart block. Congenital methaemoglobinemia. Preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier’s block). Should not be applied to damaged skin.

**CONTRA-INDICATIONS, FURTHER INFORMATION**
- Injection site: Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

**CAUTIONS**

**INTERACTIONS**
- Appendices: Anaesthetics, local
- **SIDE-EFFECTS**

**SIDE-EFFECTS, FURTHER INFORMATION**
- Toxic effects: Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection. Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection.

The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.
- Methaemoglobinemia. Methaemoglobinemia can be treated with an intravenous injection of methylthioninium chloride.

**ALLERGY AND CROSS-SENSITIVITY**

Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.
- **PREGNANCY**
  - Use lower doses for intrathecal use during late pregnancy. Large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block. Avoid paracervical or pudendal block in obstetrics (neonatal methaemoglobinemia reported).
  
  **BREAST FEEDING**
  - Present in milk but not known to be harmful.
  
  **HEPATIC IMPAIRMENT**
  - Lower doses may be required for intrathecal anaesthesia. Use with caution.
  
  **RENAL IMPAIRMENT**
  - Lower doses may be required for intrathecal anaesthesia. Use with caution.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Solution for injection**
- **Citane**t (Aspen Pharma Trading Ltd)
  - Prilocaine hydrochloride 10 mg per 1 ml
  - Citane 1% solution for injection 50 ml vials | 1 vial £0.66

**Prilocaine with felypressin**

The properties listed below are those particular to the combination only. For the properties of the components please consider, prilocaine hydrochloride above.

**INDICATIONS AND DOSE**

**Dental anaesthesia**
- **BY REGIONAL ADMINISTRATION**
  - Child: Consult expert dental sources for specific advice

**INTERACTIONS**
- Appendices: Anaesthetics, local

**SIDE-EFFECTS**

**SIDE-EFFECTS, FURTHER INFORMATION**
- Toxic effects: Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- **PREGNANCY** Not known to be harmful. Do not use for paracervical block in obstetrics.

- **BREAST FEEDING** Not known to be harmful.

- **HEPATIC IMPAIRMENT** Use with caution in severe impairment.

- **RENAL IMPAIRMENT** Caution in severe impairment. Increased risk of systemic toxicity in chronic renal failure.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

**ELECTROLYTES:** May contain Sodium

- **Ropivacaine hydrochloride (Non-proprietary)**
  - Ropivacaine hydrochloride 2 mg per 1 ml Ropivacaine 20mg/10ml solution for injection ampoules | 10 ampoule £16.50 (Hospital only)
  - Ropivacaine hydrochloride 7.5 mg per 1 ml Ropivacaine 75mg/10ml solution for injection ampoules | 10 ampoule £25.00 (Hospital only)
  - Ropivacaine hydrochloride 10 mg per 1 ml Ropivacaine 100mg/10ml solution for injection ampoules | 10 ampoule £30.00 (Hospital only)
  - Naropin (Aspen Pharma Trading Ltd)
  - Ropivacaine hydrochloride 2 mg per 1 ml Naropin 20mg/10ml solution for injection ampoules | 5 ampoule £12.79
  - Ropivacaine hydrochloride 7.5 mg per 1 ml Naropin 75mg/10ml solution for injection ampoules | 5 ampoule £15.90
  - Ropivacaine hydrochloride 10 mg per 1 ml Naropin 100mg/10ml solution for injection ampoules | 5 ampoule £19.22

**Infusion**

**ELECTROLYTES:** May contain Sodium

- **Ropivacaine hydrochloride (Non-proprietary)**
  - Ropivacaine hydrochloride 2 mg per 1 ml Ropivacaine 400mg/200ml infusion bags | 5 bag £72.25 10 bag £137.00 (Hospital only)
  - Naropin (AstraZeneca UK Ltd)
  - Ropivacaine hydrochloride 2 mg per 1 ml Naropin 400mg/200ml infusion Polybags | 5 bag £86.70

**Tetracaine**

(AMETHOCAIN)

**INDICATIONS AND DOSE**

**Anaesthesia before venepuncture or venous cannulation**

- **TO THE SKIN**
  - Neonate: Apply contents of tube (or appropriate proportion) to site of venepuncture or venous cannulation and cover with occlusive dressing; remove gel and dressing after 30 minutes for venepuncture and after 45 minutes for venous cannulation.

- Child 1 month–4 years: Apply contents of up to 1 tube (applied at separate sites at a single time or appropriate proportion) to site of venepuncture or venous cannulation and cover with occlusive dressing; remove gel and dressing after 30 minutes for venepuncture and after 45 minutes for venous cannulation.

- Child 5–17 years: Apply contents of up to 5 tubes (applied at separate sites at a single time or appropriate proportion) to site of venepuncture or venous cannulation and cover with occlusive dressing; remove gel and dressing after 30 minutes for venepuncture and after 45 minutes for venous cannulation.

- **UNLICENSED USE** Not licensed for use in neonates.

- **CONTRA-INDICATIONS** Should not be applied to damaged skin.

- **INTERACTIONS** → Appendix 1: anaesthetics, local

- **SIDE-EFFECTS** Local skin reactions
SIDE-EFFECTS, FURTHER INFORMATION
The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems; systemic side effects unlikely as minimal absorption following topical application.

- **ALLERGY AND CROSS-SENSITIVITY**
  Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- **BREAST FEEDING** Not known to be harmful.

Emergency treatment of poisoning

Overview
These notes provide only an overview of the treatment of poisoning, and it is strongly recommended that either TOXBASE or the UK National Poisons Information Service be consulted when there is doubt about the degree of risk or about management.

Most childhood poisoning is accidental. Other causes include intentional overdose, drug abuse, iatrogenic and deliberate poisoning. The drugs most commonly involved in childhood poisoning are paracetamol p. 260, ibuprofen p. 625, orally ingested creams, aspirin p. 89, iron preparations, cough medicines, and the contraceptive pill.

Hospital admission
Children who have features of poisoning should generally be admitted to hospital. Children who have taken poisons with delayed actions should also be admitted, even if they appear well. Delayed-action poisons include aspirin, iron, paracetamol, tricyclic antidepressants, and co-phenotrope (diphenoxylate with atropine, Lomotil®) p. 47; the effects of modified-release preparations are also delayed. A note of all relevant information, including what treatment has been given, should accompany the patient to hospital.

Further information
TOXBASE, the primary clinical toxicology database of the National Poisons Information Service, is available on the internet to registered users at www.toxbase.org (a backup site is available at www.toxbasebackup.org if the main site cannot be accessed). It provides information about routine diagnosis, treatment, and management of patients exposed to drugs, household products, and industrial and agricultural chemicals.

Specialist information and advice on the treatment of poisoning is available day and night from the UK National Poisons Information Service on the following number:
Tel: 0344 892 0111.

Advice on laboratory analytical services can be obtained from TOXBASE or from the National Poisons Information Service. Help with identifying capsules or tablets may be available from a regional medicines information centre or from the National Poisons Information Service (out of hours).

General care
It is often impossible to establish with certainty the identity of the poison and the size of the dose. This is not usually important because only a few poisons (such as opioids, paracetamol, and iron) have specific antidotes; few patients require active removal of the poison. In most patients, treatment is directed at managing symptoms as they arise. Nevertheless, knowledge of the type and timing of poisoning can help in anticipating the course of events. All relevant information should be sought from the poisoned individual and from carers or parents. However, such information should be interpreted with care because it may not be complete or entirely reliable. Sometimes symptoms arise from other illnesses and patients should be assessed carefully. Accidents may involve domestic and industrial products (the contents of which are not generally known). The National Poisons Information Service should be consulted when there is doubt about any aspect of suspected poisoning.

Respiration
Respiration is often impaired in unconscious patients. An obstructed airway requires immediate attention. In the absence of trauma, the airway should be opened with simple measures such as chin lift or jaw thrust. An oropharyngeal or nasopharyngeal airway may be useful in patients with reduced consciousness to prevent obstruction, provided ventilation is adequate. Intubation and ventilation should be considered in patients whose airway cannot be protected or who have respiratory acidosis because of inadequate ventilation; such patients should be monitored in a critical care area.

Most poisons that impair consciousness also depress respiration. Assisted ventilation (either mouth-to-mouth or using a bag-valve-mask device) may be needed. Oxygen is not a substitute for adequate ventilation, although it should be given in the highest concentration possible in poisoning with carbon monoxide and irritant gases.

The potential for pulmonary aspiration of gastric contents should be considered.

Blood pressure
Hypotension is common in severe poisoning with central nervous system depressants; if severe, this may lead to irreversible brain damage or renal tubular necrosis.

Hypotension should be corrected initially by raising the foot of the bed and administration of an infusion of either sodium chloride p. 561 or a colloid. Vasoconstrictor sympathomimetics are rarely required and their use may be discussed with the National Poisons Information Service or a paediatric intensive care unit.

Fluid depletion without hypotension is common after prolonged coma and after aspirin poisoning due to vomiting, sweating, and hyperpnoea.

Hypertension, often transient, occurs less frequently than hypotension in poisoning; it may be associated with
sympathomimetic drugs such as amphetamines, phencyclidine, and cocaine.

Heart
Cardiac conduction defects and arrhythmias can occur in acute poisoning, notably with tricyclic antidepressants, some antipsychotics, and some antihistamines. Arrhythmias often respond to correction of underlying hypoxia, acidosis, or other biochemical abnormalities, but ventricular arrhythmias that cause serious hypotension require treatment. If the QT interval is prolonged, specialist advice should be sought because the use of some anti-arrhythmic drugs may be inappropriate. Supraventricular arrhythmias are seldom life-threatening and drug treatment is best withheld until the patient reaches hospital.

Body temperature
Hypothermia may develop in patients of any age who have been deeply unconscious for some hours, particularly following overdose with barbiturates or phenothiazines. It may be missed unless core temperature is measured using a low-reading rectal thermometer or by some other means. Hypothermia should be managed by prevention of further heat loss and appropriate re-warming as clinically indicated.

Hypothermia can develop in patients taking CNS stimulants; children and the elderly are also at risk when taking therapeutic doses of drugs with antimuscarinic properties. Hyperthermia is initially managed by removing all unnecessary clothing and using a fan. Sponging with tepid water will promote evaporation. Advice should be sought from the National Poisons Information Service on the management of severe hyperthermia resulting from conditions such as the serotonin syndrome.

Both hyperthermia and hypothermia require urgent hospitalisation for assessment and supportive treatment.

Convulsions
Single short-lived convulsions (lasting less than 5 minutes) do not require treatment. If convulsions are protracted or recur frequently, lorazepam p. 214 or diazepam p. 212 (preferably as emulsion) should be given by slow intravenous injection into a large vein. Benzodiazepines should not be given by the intramuscular route for convulsions. If the intravenous route is not readily available, midazolam oromucosal solution p. 215 can be given by the buccal route or diazepam can be administered as a rectal solution.

Methaemoglobinemia
Drug- or chemical-induced methaemoglobinemia should be treated with methyleneimmonium chloride p. 814 if the methaemoglobin concentration is 30% or higher, or if symptoms of tissue hypoxia are present despite oxygen therapy. Methyleneimmonium chloride reduces the ferric iron of methaemoglobin back to the ferrous iron of haemoglobin; in high doses, methyleneimmonium chloride can itself cause methaemoglobinaemia.

Removal and elimination
Prevention of absorption
Given by mouth, charcoal, activated p. 810 can adsorb many poisons in the gastro-intestinal system, thereby reducing their absorption. The sooner it is given the more effective it is, but it may still be effective up to 1 hour after ingestion of the poison—longer in the case of modified-release preparations or of drugs with antimuscarinic (anticholinergic) properties. It is particularly useful for the prevention of absorption of poisons that are toxic in small amounts, such as antidepressants.

A second dose may occasionally be required when blood-drug concentration continues to rise suggesting delayed drug release or delayed gastric emptying.

Active elimination techniques
Repeated doses of charcoal, activated by mouth may enhance the elimination of some drugs after they have been absorbed; repeated doses are given after overdosage with:

- Carbamazepine
- Dapsone
- Phenobarbital
- Quinine
- Theophylline

If vomiting occurs after dosing, it should be treated (e.g. with an antiemetic drug) since it may reduce the efficacy of charcoal treatment. In cases of intolerance, the dose may be reduced and the frequency increased but this may compromise efficacy.

Charcoal, activated should not be used for poisoning with petroleum distillates, corrosive substances, alcohols, malathion, cyanides and metal salts including iron and lithium salts.

Other techniques intended to enhance the elimination of poisons after absorption are only practicable in hospital and are only suitable for a small number of severely poisoned patients. Moreover, they only apply to a limited number of poisons. Examples include:

- haemodialysis for ethylene glycol, lithium, methanol, phenobarbital, salicylates, and sodium valproate;
- alkalinisation of the urine for salicylates.

Removal from the gastro-intestinal tract
Gastric lavage is rarely required as benefit rarely outweighs risk; advice should be sought from the National Poisons Information Service if a significant quantity of iron or lithium has been ingested within the previous hour.

Whole bowel irrigation (by means of a bowel cleansing preparation) has been used in poisoning with certain modified-release or enteric-coated formulations, in severe poisoning with lithium salts, and if illicit drugs are carried in the gastro-intestinal tract (‘body-packing’). However, it is not clear that the procedure improves outcome and advice should be sought from the National Poisons Information Service.

The administration of laxatives alone has no role in the management of the poisoned child and is not a recommended method of gut decontamination. The routine use of a laxative in combination with charcoal, activated has mostly been abandoned. Laxatives should not be administered to young children because of the likelihood of fluid and electrolyte imbalance.

Alcohol
Acute intoxication with alcohol (ethanol) is common in adults but also occurs in children. The features include ataxia, dysarthria, nystagmus, and drowsiness, which may progress to coma, with hypotension and acidosis. Aspiration of vomit is a special hazard and hypoglycaemia may occur. Patients are managed supportively, with particular attention to maintaining a clear airway and measures to reduce the risk of aspiration of gastric contents. The blood glucose is measured and glucose given if indicated.

Aspirin
The main features of salicylate poisoning are hyperventilation, tinnitus, deafness, vasodilatation, and sweating. Coma is uncommon but indicates very severe poisoning. The associated acid–base disturbances are complex.

Treatment must be in hospital, where plasma salicylate, pH, and electrolytes can be measured; absorption of aspirin may be slow and the plasma–salicylate concentration may continue to rise for several hours, requiring repeated measurement. Plasma–salicylate concentration may not correlate with clinical severity in the young, and clinical and biochemical assessment is necessary. Generally, the clinical
Emergency treatment of poisoning

805

severity of poisoning is less below a plasma-saliclylate concentration of 500 mg/litre (3.6 mmol/litre), unless there is evidence of metabolic acidosis. Activated charcoal can be given within 1 hour of ingesting more than 125 mg/kg of aspirin. Fluid losses should be replaced and intravenous sodium bicarbonate may be given (ensuring plasma-potassium concentration is within the reference range) to enhance urinary salicylate excretion (optimum urinary pH 7.5–8.5).

Plasma-potassium concentration should be corrected before giving sodium bicarbonate as hypokalaemia may complicate alkalisation of the urine. Haemodialysis is the treatment of choice for severe salicylate poisoning and should be considered when the plasma-saliclylate concentration exceeds 700 mg/litre (5.1 mmol/litre) or in the presence of severe metabolic acidosis, convulsions, respiratory failure, pulmonary oedema or persistently high plasma-saliclylate concentrations unresponsive to urinary alkalisation.

Opioids

Opioids (narcotic analgesics) cause varying degrees of coma, respiratory depression, and pinpoint pupils. The specific antidote naloxone hydrochloride p. 813 is indicated if there is coma or bradypnoea. Since naloxone has a shorter duration of action than many opioids, close monitoring and repeated injections are necessary according to the respiratory rate and depth of coma. When repeated administration of naloxone is required, it can be given by continuous intravenous infusion instead and the rate of infusion adjusted according to vital signs. All children should be observed for at least 6 hours after the last dose of naloxone. The effects of some opioids, such as buprenorphine, are only partially reversed by naloxone. Dextropropoxyphene and methadone have very long durations of action; patients may need to be monitored for long periods following large overdoses.

Naloxone reverses the opioid effects of dextropropoxyphene. The long duration of action of dextropropoxyphene calls for prolonged monitoring and further doses of naloxone may be required. Norpropoxyphene, a metabolite of dextropropoxyphene, also has cardiotoxic effects which may require treatment with sodium bicarbonate p. 558 or magnesium sulfate p. 571, or both. Arrhythmias may occur for up to 12 hours.

Paracetamol

In cases of intravenous paracetamol poisoning contact the National Poisons Information Service for advice on risk assessment and management.

Toxic doses of paracetamol may cause severe hepatocellular necrosis and, much less frequently, renal tubular necrosis. Nausea and vomiting, the only early features of poisoning, usually settle within 24 hours. Persistence beyond this time, often associated with the onset of right subcostal pain and tenderness, usually indicates development of hepatic necrosis. Liver damage is maximal 3–4 days after paracetamol overdose and may lead to encephalopathy, haemorrhage, hypoglycaemia, cerebral oedema, and death. Therefore, despite a lack of significant early symptoms, children who have taken an overdose of paracetamol should be transferred to hospital urgently.

To avoid underestimating the potentially toxic paracetamol dose ingested by obese children who weigh more than 110 kg, use a body-weight of 110 kg (rather than their actual body-weight) when calculating the total dose of paracetamol ingested (in mg/kg).

Acetylcysteine p. 814 protects the liver if infused up to, and possibly beyond, 24 hours of ingesting paracetamol. It is most effective if given within 8 hours of ingestion, after which effectiveness declines. Very rarely, giving acetylcysteine by mouth [unlicensed route] is an alternative if intravenous access is not possible—contact the National Poisons Information Service for advice.

Neonates less than 45 weeks corrected gestational age may be more susceptible to paracetamol-induced liver toxicity, therefore, treatment with acetylcysteine should be considered in all paracetamol overdoses, and advice should be sought from the National Poisons Information Service.

Acute overdose

Hepatotoxicity may occur after a single ingestion of more than 150 mg/kg paracetamol taken in less than 1 hour. Rarely, hepatotoxicity may develop with single ingestions as low as 75 mg/kg of paracetamol taken in less than 1 hour.

Children who have ingested 75 mg/kg or more of paracetamol in less than 1 hour should be referred to hospital. Administration of charcoal, activated p. 810 should be considered if paracetamol in excess of 150 mg/kg is thought to have been ingested within the previous hour.

Children at risk of liver damage and, therefore, requiring acetylcysteine, can be identified from a single measurement of the plasma-paracetamol concentration, related to the time from ingestion, provided this time interval is not less than 4 hours; earlier samples may be misleading. The concentration is plotted on a paracetamol treatment graph, with a reference line (‘treatment line’) joining plots of 100 mg/litre (0.66 mmol/litre) at 4 hours and 3.13 mg/litre (0.02 mmol/litre) at 24 hours. Acetylcysteine treatment should commence immediately in children:

- whose plasma-paracetamol concentration falls on or above the treatment line on the paracetamol treatment graph;
- who present 8–24 hours after taking an acute overdose of more than 150 mg/kg of paracetamol, even if the plasma-paracetamol concentration is not yet available; acetylcysteine can be discontinued if the plasma-paracetamol concentration is later reported to be below the treatment line on the paracetamol treatment graph, provided that the child is asymptomatic and liver function tests, serum creatinine and INR are normal.

The prognostic accuracy of a plasma-paracetamol concentration taken after 15 hours is uncertain, but a concentration on or above the treatment line on the paracetamol treatment graph should be regarded as carrying a serious risk of liver damage. If more than 15 hours have elapsed since ingestion, or there is doubt about appropriate management, advice should be sought from the National Poisons Information Service.

'Staggered' overdose, uncertain time of overdose, or therapeutic excess

A 'staggered' overdose involves ingestion of a potentially toxic dose of paracetamol over more than one hour, with the possible intention of causing self-harm. Therapeutic excess is the inadvertent ingestion of a potentially toxic dose of paracetamol during its clinical use. The paracetamol treatment graph is unreliable if a 'staggered' overdose is taken, if there is uncertainty about the time of the overdose, or if there is therapeutic excess. In these cases, children who have taken more than 150 mg/kg of paracetamol in any 24-hour period are at risk of toxicity and should be commenced on acetylcysteine immediately, unless it is more than 24 hours since the last ingestion, the patient is asymptomatic, the plasma-paracetamol concentration is undetectable, and liver function tests, serum creatinine and INR are normal.

Rarely, toxicity can occur with paracetamol doses between 75–150 mg/kg in any 24-hour period; for some children this may be within the licensed dose, but ingestion of a licensed dose of paracetamol is not considered an overdose. Clinical judgement of the individual case is necessary to determine whether to treat those who have ingested this amount of paracetamol.

Although there is some evidence suggesting that factors such as the use of liver enzyme-inducing drugs (e.g.
carbamazepine p. 189, efavirenz p. 394, nevirapine p. 395, phenobarbital p. 208, phenytoin p. 198, primidone p. 209, rifabutin p. 348, rifampicin p. 349, St John’s wort), chronic alcoholism, and starvation may increase the risk of hepatotoxicity, the CHM has advised that these should no longer be used in the assessment of paracetamol toxicity.

Significant toxicity is unlikely if, 24 hours or longer after the last paracetamol ingestion, the patient is asymptomatic, the plasma-paracetamol concentration is undetectable, and liver function tests, serum creatinine and INR are normal. Children with clinical features of hepatic injury such as jaundice or hepatic tenderness should be treated urgently with acetylcysteine. If there is uncertainty about a patient’s risk of toxicity after paracetamol overdose, treatment with acetylcysteine should be commenced. Advice should be sought from the National Poisons Information Service whenever necessary.

**Antidepressants**

**Tricyclic and related antidepressants**

Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. Metabolic acidosis may complicate severe poisoning; delirium with confusion, agitation, and visual and auditory hallucinations are common during recovery.

Assessment in hospital is strongly advised in case of poisoning by tricyclic and related antidepressants but symptomatic treatment can be given before transfer.

Supportive measures to ensure a clear airway and adequate ventilation during transfer are mandatory. Intravenous lorazepam or intravenous diazepam (preferably in emulsion form) may be required to treat convulsions. Activated charcoal given within 1 hour of the overdose reduces absorption of the drug. Although arrhythmias are worrying, some will respond to correction of hypoxia and acidosis. The use of anti-arrhythmic drugs is best avoided, but intravenous infusion of sodium bicarbonate can arrest arrhythmias or prevent them in those with an extended QRS duration. Diazepam p. 212 given by mouth is usually adequate to sedate delirious patients but large doses may be required.

**Selective serotonin re-uptake inhibitors (SSRIs)**

Symptoms of poisoning by selective serotonin re-uptake inhibitors include nausea, vomiting, agitation, tremor, nystagmus, drowsiness, and sinus tachycardia; convulsions may occur. Rarely, severe poisoning results in the serotonin syndrome, with marked neuropsychiatric effects, neuromuscular hyperactivity, and autonomic instability; hyperthermia, rhabdomyolysis, renal failure, and coagulopathies may develop.

Management of SSRI poisoning is supportive. Activated charcoal given within 1 hour of the overdose reduces absorption of the drug. Convulsions can be treated with lorazepam p. 214, diazepam p. 212, or buccal midazolam p. 215 (see **Convulsions**). Contact the National Poisons Information Service for the management of hyperthermia or the serotonin syndrome.
Antimalarials
Overdosage with quinine, chloroquine, or hydroxychloroquine is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

Antipsychotics
Phenothiazines and related drugs
Phenothiazines cause less depression of consciousness and respiration than other sedatives. Hypotension, hypothermia, sinus tachycardia, and arrhythmias may complicate poisoning. Dystonic reactions can occur with therapeutic doses (particularly with prochlorperazine and trifluoperazine), and convulsions may occur in severe cases. Arrhythmias may respond to correction of hypoxia, acidosis, and other biochemical abnormalities, but specialist advice should be sought if arrhythmias result from a prolonged QT interval; the use of some anti-arrhythmic drugs can worsen such arrhythmias. Dystonic reactions are rapidly abolished by injection of drugs such as procyclidine hydrochloride p. 246 or diazepam (emulsion preferred).

Second-generation antipsychotic drugs
Features of poisoning by second-generation antipsychotic drugs include drowsiness, convulsions, extrapyramidal symptoms, hypotension, and ECG abnormalities (including prolongation of the QT interval). Management is supportive. Charcoal, activated p. 810 can be given within 1 hour of ingesting a significant quantity of a second-generation antipsychotic drug.

Benzodiazepines
Benzodiazepines taken alone cause drowsiness, ataxia, dysarthria, nystagmus, and occasionally respiratory depression, and coma. Charcoal, activated can be given within 1 hour of ingesting a significant quantity of benzodiazepine, provided the patient is awake and the airway is protected. Benzodiazepines potentiate the effects of other central nervous system depressants taken concomitantly. Use of the benzodiazepine antagonist flumazenil p. 811 [unlicensed indication] can be hazardous, particularly in mixed overdoses involving tricyclic antidepressants or in benzodiazepine-dependent patients. Flumazenil may prevent the need for ventilation, particularly in patients with severe respiratory disorders; it should be used on expert advice only and not as a diagnostic test in children with a reduced level of consciousness.

Beta blockers
Therapeutic overdosages with beta-blockers may cause lightheadedness, dizziness, and possibly syncope as a result of bradycardia and hypotension; heart failure may be precipitated or exacerbated. These complications are most likely in children with conduction system disorders or impaired myocardial function. Bradycardia is the most common arrhythmia caused by beta-blockers, but sotalol may induce ventricular tachyarrhythmias (sometimes of the torsade de points type). The effects of massive overdose can vary from one beta-blocker to another; propranolol overdose in particular may cause coma and convulsions. Acute massive overdose must be managed in hospital and expert advice should be obtained. Maintenance of a clear airway and adequate ventilation is mandatory. An intravenous injection of atropine sulfate p. 779 is required to treat bradycardia. Cardiogenic shock unresponsive to atropine sulfate is probably best treated with an intravenous injection of glucagon p. 444 [unlicensed] in glucose 5% (with precautions to protect the airway in case of vomiting) followed by an intravenous infusion. If glucagon is not available, intravenous isoprenaline (available from ‘special-order’ manufacturers or specialist importing companies) is an alternative. A cardiac pacemaker can be used to increase the heart rate.

Calcium-channel blockers
Features of calcium-channel blocker poisoning include nausea, vomiting, dizziness, agitation, confusion, and coma in severe poisoning. Metabolic acidosis and hyperglycaemia may occur. Verapamil and diltiazem have a profound cardiac depressant effect causing hypotension and arrhythmias, including complete heart block and asystole. The dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

Charcoal, activated should be considered if the patient presents within 1 hour of overdose with a calcium-channel blocker; repeated doses of activated charcoal are considered if a modified-release preparation is involved. In patients with significant features of poisoning, calcium chloride p. 567 or calcium gluconate p. 568 is given by injection; atropine sulfate is given to correct symptomatic bradycardia. In severe cases, an insulin and glucose infusion may be required in the management of hypotension and myocardial failure. For the management of hypotension, the choice of inotropic sympathomimetic depends on whether hypotension is secondary to vasodilatation or to myocardial depression—advice should be sought from the National Poisons Information Service.

Iron salts
Iron poisoning in childhood is usually accidental. The symptoms are nausea, vomiting, abdominal pain, diarrhoea, haematemesis, and rectal bleeding. Hypotension and hepatocellular necrosis can occur later. Coma, shock, and metabolic acidosis indicate severe poisoning.

Advice should be sought from the National Poisons Information Service if a significant quantity of iron has been ingested within the previous hour.

Mortality is reduced by intensive and specific therapy with desferrioxamine mesilate p. 550, which chelates iron. The serum-iron concentration is measured as an emergency and intravenous desferrioxamine mesilate given to chelate absorbed iron in excess of the expected iron binding capacity. In severe toxicity intravenous desferrioxamine mesilate should be given immediately without waiting for the result of the serum-iron measurement.

Lithium
Most cases of lithium intoxication occur as a complication of long-term therapy and are caused by reduced excretion of the drug because of a variety of factors including dehydration, deterioration of renal function, infections, and co-administration of diuretics or NSAIDs (or other drugs that interact). Acute deliberate overdoses may also occur with delayed onset of symptoms (12 hours or more) owing to slow entry of lithium into the tissues and continuing absorption from modified-release formulations.

The early clinical features are non-specific and may include apathy and restlessess which could be confused with mental changes arising from the child’s depressive illness. Vomiting, diarrhoea, ataxia, weakness, dysarthria, muscle twitching, and tremor may follow. Severe poisoning is associated with convulsions, coma, renal failure, electrolyte imbalance, dehydration, and hypotension. Therapeutic serum-lithium concentrations are within the range of 0.4–1 mmol/litre; concentrations in excess of 2 mmol/litre are usually associated with serious toxicity and such cases may need treatment with haemodialysis if neurological symptoms or renal failure are present. In acute overdosage much higher serum-lithium concentrations may be present without features of toxicity and all that is usually necessary is to take measures to increase urine output (e.g.
by increasing fluid intake but avoiding diuretics). Otherwise, treatment is supportive with special regard to electrolyte balance, renal function, and control of convulsions. Whole-bowel irrigation should be considered for significant ingestion, but advice should be sought from the National Poisons Information Service.

**Stimulants**

Amphetamines

Amphetamines cause wakefulness, excessive activity, paranoia, hallucinations, and hypertension followed by exhaustion, convulsions, hyperthermia, and coma. The early stages can be controlled by diazepam p. 212 or lorazepam p. 214; advice should be sought from the National Poisons Information Service on the management of hypertension. Later, tepid sponging, anticonvulsants, and artificial respiration may be needed.

Cocaine

Cocaine stimulates the central nervous system, causing agitation, dilated pupils, tachycardia, hypertension, hallucinations, hyperthermia, hypertonnia, and hyperreflexia; cardiac effects include chest pain, myocardial infarction, and arrhythmias.

Initial treatment of cocaine poisoning involves cooling measures for hyperthermia (see Body temperature); agitation, hypertension and cardiac effects require specific treatment and expert advice should be sought.

Ecstasy

Ecstasy (methylenedioxymethamphetamine, MDMA) may cause severe reactions, even at doses that were previously tolerated. The most serious effects are delirium, coma, convulsions, ventricular arrhythmias, hyperthermia, rhabdomyolysis, acute renal failure, acute hepatitis, disseminated intravascular coagulation, adult respiratory distress syndrome, hyperreflexia, hypotension and intracerebral haemorrhage; hyponatraemia has also been associated with ecstasy use and syndrome of inappropriate antidiuretic hormone secretion (SIADH) can occur.

Treatment of methylenedioxymethamphetamine poisoning is supportive, with diazepam to control persistent convulsions and close monitoring including ECG. For the management of agitation, see specialist advice. Self-induced water intoxication should be considered in patients with ecstasy poisoning.

‘Liquid ecstasy’ is a term used for sodium oxybate (gamma-hydroxybutyrate, GHB), which is a sedative.

**Theophylline**

Theophylline and related drugs are often prescribed as modified-release formulations and toxicity can therefore be delayed. They cause vomiting (which may be severe and intractable), agitation, restlessness, dilated pupils, sinus tachycardia, and hyperpyrexia. More serious effects are haematemesis, convulsions, and supraventricular and ventricular arrhythmias. Severe hypokalaemia may develop rapidly.

Repeated doses of charcoal, activated p. 810 can be used to eliminate theophylline even if more than 1 hour has elapsed after ingestion and especially if a modified-release preparation has been taken (see also under Active Elimination Techniques). Ondansetron p. 253 may be effective for severe vomiting that is resistant to other antiemetics. Hypokalaemia is corrected by intravenous infusion of potassium chloride p. 575 and may be so severe as to require high doses under ECG monitoring. Convulsions should be controlled by intravenous administration of lorazepam or diazepam (see Convulsions). For the management of agitation associated with theophylline overdosage, seek specialist advice.

Provided the child does not suffer from asthma, a short-acting beta-blocker can be administered intravenously to reverse severe tachycardia, hypokalaemia, and hyperglycaemia.

**Other poisons**

Consult either the National Poisons Information Service day and night or TOXBASE, see under the National Poisons Information Service.

**Cyanides**

Oxygen should be administered to children with cyanide poisoning. The choice of antidote depends on the severity of poisoning, certainty of diagnosis, and the cause. Dicobalt edetate p. 810 is the antidote of choice when there is a strong clinical suspicion of severe cyanide poisoning, but it should not be used as a precautionary measure. Dicobalt edetate itself is toxic, associated with anaphylactoid reactions, and is potentially fatal if administered in the absence of cyanide poisoning. A regimen of sodium nitrite p. 810 followed by sodium thiosulfate p. 810 is an alternative if dicobalt edetate is not available.

Hydroxocobalamin p. 547 (Cyanokit®—no other preparation of hydroxocobalamin is suitable) can be considered for use in victims of smoke inhalation who show signs of significant cyanide poisoning.

**Ethylene glycol and methanol**

Fomepizole (available from ‘special-order’ manufacturers or specialist importing companies) is the treatment of choice for ethylene glycol and methanol (methyl alcohol) poisoning. If necessary, ethanol (by mouth or by intravenous infusion) can be used, but with caution. Advice on the treatment of ethylene glycol and methanol poisoning should be obtained from the National Poisons Information Service. It is important to start antidote treatment promptly in cases of suspected poisoning with these agents.

**Heavy metals**

Heavy metal antidotes include succimer (DMSA) [unlicensed], unithiol (DMPS) [unlicensed], sodium calcium edetate [unlicensed], and dimercaprol. Dimercaprol in the management of heavy metal poisoning has been superseded by other chelating agents. In all cases of heavy metal poisoning, the advice of the National Poisons Information Service should be sought.

**Noxious gases**

**Carbon monoxide**

Carbon monoxide poisoning is usually due to inhalation of smoke, car exhaust, or fumes caused by blocked flues or incomplete combustion of fuel gases in confined spaces. Immediate treatment of carbon monoxide poisoning is essential. The patient should be moved to fresh air, the airway cleared, and high-flow oxygen 100% administered as soon as available. Artificial respiration should be given as necessary and continued until adequate spontaneous breathing starts, or stopped only after persistent and efficient treatment of cardiac arrest has failed. The child should be admitted to hospital because complications may arise after a delay of hours or days. Cerebral oedema may occur in severe poisoning and is treated with an intravenous infusion of mannitol p. 137. Referral for hyperbaric oxygen treatment should be discussed with the National Poisons Information Service if the patient is pregnant or in cases of severe poisoning such if the patient is or has been unconscious, or has psychiatric or neurological features other than a headache or has myocardial ischaemia or an arrhythmia, or has a blood carboxyhaemoglobin concentration of more than 20%.

**Sulfur dioxide, chlorine, phosphene, ammonia**

All of these gases can cause upper respiratory tract and conjunctival irritation. Pulmonary oedema, with severe breathlessness and cyanosis may develop suddenly up to
36 hours after exposure. Death may occur. Patients are kept under observation and those who develop pulmonary oedema are given oxygen. Assisted ventilation may be necessary in the most serious cases.

CS spray
CS spray, which is used for riot control, irritates the eyes (hence 'ear gas') and the respiratory tract; symptoms normally settle spontaneously within 15 minutes. If symptoms persist, the patient should be removed to a well-ventilated area, and the exposed skin washed with soap and water after removal of contaminated clothing. Contact lenses should be removed and rigid ones washed (soft ones should be discarded). Eye symptoms should be treated by irrigating the eyes with physiological saline (or water if saline is not available) and advice sought from an ophthalmologist. Patients with features of severe poisoning, particularly respiratory complications, should be admitted to hospital for symptomatic treatment.

Nerve agents
Treatment of nerve agent poisoning is similar to organophosphorus insecticide poisoning, but advice must be sought from the National Poisons Information Service. The risk of cross-contamination is significant; adequate decontamination and protective clothing for healthcare personnel are essential. In emergencies involving the release of nerve agents, kits ('NAAS pods') containing pralidoxime chloride p. 811 can be obtained through the Ambulance Service from the National Blood Service (or the Welsh Blood Service in South Wales or designated hospital pharmacies in Northern Ireland and Scotland—see TOXBASE for list of designated centres).

Pesticides
Organophosphorus insecticides
Organophosphorus insecticides are usually supplied as powders or dissolved in organic solvents. All are absorbed through the bronchi and intact skin as well as through the gut and inhibit cholinesterase activity, thereby prolonging and intensifying the effects of acetylcholine. Toxicity between different compounds varies considerably, and onset may be delayed after skin exposure.

Anxiety, restlessness, dizziness, headache, miosis, nausea, hypersalivation, vomiting, abdominal colic, diarrhoea, bradycardia, and sweating are common features of organophosphorus poisoning. Muscle weakness and fasciculation may develop and progress to generalised paralysis, including the ocular and respiratory muscles. Convulsions, coma, pulmonary oedema with copious bronchial secretions, hypoxia, and arrhythmias occur in severe cases. Hyperglycaemia and glycosuria without ketonuria may also be present.

Further absorption of the organophosphorus insecticide should be prevented by moving the child to fresh air, removing soiled clothing, and washing contaminated skin. In severe poisoning it is vital to ensure a clear airway, frequent removal of bronchial secretions, and adequate ventilation and oxygenation; gastric lavage may be considered provided that the airway is protected. Atropine sulfate p. 779 will reverse the muscarinic effects of acetylcholine and is given by intravenous injection until the skin becomes flushed and dry, the pupils dilate, and bradycardia is abolished.

Prolidoxime chloride, a cholinesterase reactivator, is used as an adjunct to atropine sulfate in moderate or severe poisoning. It improves muscle tone within 30 minutes of administration. Prolidoxime chloride is continued until the patient has not required atropine sulfate for 12 hours. Prolidoxime chloride can be obtained from designated centres, the names of which are held by the National Poisons Information Service.

Snake bites and animal stings
Snake bites
Envenoming from snake bite is uncommon in the UK. Many exotic snakes are kept, some illegally, but the only indigenous venomous snake is the adder (Vipera berus). The bite may cause local and systemic effects. Local effects include pain, swelling, bruising, and tender enlargement of regional lymph nodes. Systemic effects include early anaphylactic symptoms (transient hypotension with syncope, angioedema, urticaria, abdominal colic, diarrhoea, and vomiting), with later persistent or recurrent hypotension, ECG abnormalities, spontaneous systemic bleeding, coagulopathy, adult respiratory distress syndrome, and acute renal failure. Fatal envenoming is rare but the potential for severe envenoming must not be underestimated.

Early anaphylactic symptoms should be treated with adrenaline/epinephrine p. 132. Indications for European viper snake venom antiserum treatment p. 815 include systemic envenoming, especially hypotension, ECG abnormalities, vomiting, haemostatic abnormalities, and marked local envenoming such that after bites on the hand or foot, swelling extends beyond the wrist or ankle within 4 hours of the bite. For those children who present with clinical features of severe envenoming (e.g. shock, ECG abnormalities, or local swelling that has advanced from the foot to above the knee or from the hand to above the elbow within 2 hours of the bite), a higher initial dose of the European viper snake venom antiserum is recommended; if symptoms of systemic envenoming persist contact the National Poisons Information Service. Adrenaline/epinephrine injection must be immediately to hand for treatment of anaphylactic reactions to the European viper snake venom antiserum.

European viper snake venom antiserum is available for bites by certain foreign snakes and spiders, stings by scorpions and fish. For information on identification, management, and for supply in an emergency, telephone the National Poisons Information Service. Whenever possible the TOXBASE entry should be read, and relevant information collected, before telephoning the National Poisons Information Service.

Insect stings
Stings from ants, wasps, hornets, and bees cause local pain and swelling but seldom cause severe direct toxicity unless many stings are inflicted at the same time. If the sting is in the mouth or on the tongue local swelling may threaten the upper airway. The stings from these insects are usually treated by cleaning the area with a topical antiseptic. Bee stings should be removed as quickly as possible. Anaphylactic reactions require immediate treatment with intramuscular adrenaline/epinephrine; self-administered (or administered by a carer) intramuscular adrenaline/epinephrine (e.g. EpiPen®) is the best first-aid treatment for patients with severe hypersensitivity. An inhaled bronchodilator should be used for asthmatic reactions, see also the management of anaphylaxis. A short course of an oral antihistamine or a topical corticosteroid may help to reduce inflammation and relieve itching. A vaccine containing extracts of bee and wasp venom can be used to reduce the risk of anaphylaxis and systemic reactions in patients with systemic hypersensitivity to bee or wasp stings.

Marine stings
The severe pain of weeverfish (Trachinus vipera) and Portuguese man-o’-war stings can be relieved by immersing the stung area immediately in uncomfortably hot, but not scalding, water (not more than 45 °C). People stung by jellyfish and Portuguese man-o’-war around the UK coast should be removed from the sea as soon as possible. Adherent tentacles should be lifted off carefully (wearing
gloves or using tweezers) or washed off with seawater.
Alcoholic solutions, including suntan lotions, should not be applied because they can cause further discharge of stinging hairs. Ice packs can be used to reduce pain.

Other poisons
Consult either the National Poisons Information Service day and night or TOXBASE.
The National Poisons Information Service (Tel: 0344 892 0111) will provide specialist advice on all aspects of poisoning day and night.

1 Active elimination from the gastro-intestinal tract

ANTIDOTES AND CHELATORS > INTESTINAL ADSORBENTS

Charcoal, activated

- **INDICATIONS AND DOSE**
  - Reduction of absorption of poisons in the gastro-intestinal system
    - By mouth
    - Neonate: 1 g/kg.
    - Child 1 month–11 years: 1 g/kg (max. per dose 50 g)
    - Child 12–17 years: 50 g
  - Active elimination of poisons
    - By mouth
    - Neonate: 1 g/kg every 4 hours, dose may be reduced and the frequency increased if not tolerated, reduced dose may compromise efficacy
    - Child 1 month–11 years: 1 g/kg every 4 hours (max. per dose 50 g), dose may be reduced and the frequency increased if not tolerated, reduced dose may compromise efficacy
    - Child 12–17 years: Initially 50 g, then 50 g every 4 hours, reduced if not tolerated to 25 g every 2 hours, alternatively 12.5 g every 1 hour, reduced dose may compromise efficacy

- **CAUTIONS** Comatose patient (risk of aspiration—ensure airway is protected) · drowsy patient (risk of aspiration—ensure airway is protected) · reduced gastrointestinal motility (risk of obstruction)
- **SIDE-EFFECTS** Black stools
- **DIRECTIONS FOR ADMINISTRATION** Suspension or reconstituted powder may be mixed with soft drinks (e.g. caffeine-free diet cola) or fruit juices to mask the taste.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - Oral suspension
    - Actidose-Aqua Advance (Alliance Pharmaceuticals Ltd)
      - Activated charcoal 208 mg per 1 ml Actidose-Aqua Advance 1.04g/5ml oral suspension £12.89
    - Carbomix (Teva UK Ltd)
      - Activated charcoal 200 mg per 1 ml Carbomix 200mg/ml oral suspension sugar-free £11.88
  - Granules
    - Carbomix (Beacon Pharmaceuticals Ltd)
      - Activated charcoal 813 mg per 1 gram Carbomix 81.3% granules sugar-free 50 gram £11.90

2 Chemical toxicity
2.1 Cyanide toxicity

ANTIDOTES AND CHELATORS

**Dicobalt edetate**

- **INDICATIONS AND DOSE**
  - Severe poisoning with cyanides
    - By intravenous injection
      - Child: Consult the National Poisons Information Service
    - Adult: Dose: 300 mg/kg (max. per dose 300 mg), to be given over 5–20 minutes followed by sodium thiosulphate injection
  - DOSE EQUIVALENCE AND CONVERSION
    - 1–300 mg/kg equates to 0.13–0.33 mL/kg of a 3% solution.
    - Dose: Max. of 300 mg equates to 10 mL of a 3% solution.

- **SIDE-EFFECTS** Flushing (due to vasodilatation) · headache (due to vasodilatation)
- **EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply where administration is for saving life in emergency.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Sodium nitrite**

- **INDICATIONS AND DOSE**
  - Poisoning with cyanides (used in conjunction with sodium thiosulphate)
    - By intravenous injection
      - Child: 4–10 mg/kg (max. per dose 300 mg), to be given over 5–20 minutes followed by sodium thiosulphate injection
      - Solution for injection
        - Dicobalt edetate (Non-proprietary) Dicobalt edetate 15 mg per 1 ml Dicobalt edetate 300mg/20ml solution for injection ampoules 6 ampoule Pack £117.20
  - DOSE EQUIVALENCE AND CONVERSION
    - 4–10 mg/kg equates to 0.13–0.33 mL/kg of a 3% solution.
    - Dose: Max. of 300 mg equates to 10 mL of a 3% solution.

- **SIDE-EFFECTS** Anaphylactoid reactions · cardiac abnormalities · facial oedema · hypotension · laryngeal oedema · tachycardia · vomiting
- **EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply where administration is for saving life in emergency.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Sodium thiosulphate**

- **INDICATIONS AND DOSE**
  - Poisoning with cyanides (used in conjunction with sodium nitrite)
    - By intravenous injection
      - Child: 400 mg/kg (max. per dose 12.5 g), to be given over 10 minutes, dose may be repeated in severe cyanide poisoning if dicobalt edetate not available
      - DOSE EQUIVALENCE AND CONVERSION
        - 400 mg/kg equates to 0.8 mL/kg of a 50% solution.
        - 12.5 g equates to 25 mL of a 50% solution.
3 Drug toxicity

3.1 Benzodiazepine toxicity

ANTIDOTES AND CHELATORS

BENZODIAZEPINE ANTAGONISTS

Flumazenil

- **INDICATIONS AND DOSE**
  - Reversal of sedative effects of benzodiazepines
    - **BY INTRAVENOUS INJECTION**
      - Neonate: 10 micrograms/kg every 1 minute if required, dose to be administered over 15 seconds.
      - Child: 10 micrograms/kg every 1 minute (max. per dose 200 micrograms) if required, dose to be administered over 15 seconds; maximum 1 mg per course; maximum 50 micrograms/kg per course
  - Reversal of sedative effects of benzodiazepines (if drowsiness recurs after injection)
    - **BY INTRAVENOUS INJECTION**
      - Neonate: 2–10 micrograms/kg/hour, adjusted according to response.
      - Child: 2–10 micrograms/kg/hour (max. per dose 400 micrograms/hour), adjusted according to response
  - Reversal of sedative effects of benzodiazepines in intensive care
    - **BY INTRAVENOUS INJECTION**
      - Child: 10 micrograms/kg every 1 minute (max. per dose 200 micrograms) if required, dose to be administered over 15 seconds; maximum 2 mg per course; maximum 50 micrograms/kg per course

- **UNLICENSED USE**

**IMPORTANT SAFETY INFORMATION**
Flumazenil should only be administered by, or under the direct supervision of, personnel experienced in its use.

- **CONTRA-INDICATIONS**
  - Life-threatening condition (e.g. raised intracranial pressure, status epilepticus) controlled by benzodiazepines

- **CAUTIONS**
  - Avoid rapid injection following major surgery.
  - Avoid rapid injection in high-risk or anxious patients.
  - Benzodiazepine dependence (may precipitate withdrawal symptoms). Children: ensure neuromuscular blockade cleared before giving. Head injury (rapid reversal of benzodiazepine sedation may cause convulsions). History of panic disorders (risk of recurrence) prolonged benzodiazepine therapy for epilepsy (risk of convulsions). Short-acting (repeat doses may be necessary—benzodiazepine effects may persist for at least 24 hours)

- **SIDE-EFFECTS**
  - Common or very common: Nausea, vomiting
  - Uncommon: Anxiety, fear, palpitation
  - Frequency not known: Agitation, chills, convulsions (particularly in those with epilepsy), dizziness, flushing, sensory disturbance, sweating, tachycardia, transient hypertension

- **PREGNANCY**
  - Not known to be harmful.

- **BREAST FEEDING**
  - Avoid breast-feeding for 24 hours.

- **HEPATIC IMPAIRMENT**
  - Carefully titrate dose.

- **DIRECTIONS FOR ADMINISTRATION**
  - For continuous intravenous infusion, dilute with Glucose 5% or Sodium Chloride 0.9%.
3.2 Digoxin toxicity

**ANTIDOTES AND CHELATORS > ANTIBODIES**

Digoxin-specific antibody

- **INDICATIONS AND DOSE**
  Treatment of known or strongly suspected life-threatening digoxin toxicity associated with ventricular arrhythmias or bradycardias unresponsive to atropine and when measures beyond the withdrawal of digoxin and correction of any electrolyte abnormalities are considered necessary
  - BY INTRAVENOUS INFUSION
  - Child: Serious cases of digoxin toxicity should be discussed with the National Poisons Information Service (consult product literature)

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.
  **Powder for solution for infusion**
  - DigiFab (BTG International Ltd)
  - Digoxin-specific antibody fragments 40 mg DigiFab 40mg powder for solution for infusion vials | 1 vial | £750.00 (Hospital only)

3.3 Heparin toxicity

**ANTIODES AND CHELATORS**

Protamine sulfate

- **INDICATIONS AND DOSE**
  Overdosage with intravenous injection or intravenous infusion of unfractionated heparin (less than 30 minutes lapsed since overdose)
  - BY INTRAVENOUS INJECTION
  - Child: 1 mg (max. per dose 50 mg), to be administered at a rate not exceeding 5 mg/minute, to neutralise each 100 units of unfractionated heparin
  Overdosage with intravenous injection or intravenous infusion of unfractionated heparin (if 30–60 minutes lapsed since overdose)
  - BY INTRAVENOUS INJECTION
  - Child: 500–750 micrograms (max. per dose 50 mg), to be administered at a rate not exceeding 5 mg/minute, to neutralise each 100 units of unfractionated heparin
  Overdosage with intravenous injection or intravenous infusion of unfractionated heparin (if 60–120 minutes lapsed since overdose)
  - BY INTRAVENOUS INJECTION
  - Child: 375–500 micrograms (max. per dose 50 mg), to be administered at a rate not exceeding 5 mg/minute, to neutralise each 100 units of unfractionated heparin

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.
  **Solution for injection**
  - Protamine sulfate (Non-proprietary)
  - Protamine sulfate 10 mg per 1 ml Protamine sulfate 100mg/10ml solution for injection ampoules | 5 ampoule | no price available
  Protamine sulfate 50mg/5ml solution for injection ampoules | 10 ampoule | £49.55

Overdosage with intravenous injection or intravenous infusion of unfractionated heparin (if over 120 minutes lapsed since overdose)
  - BY INTRAVENOUS INJECTION
  - Child: 250–375 micrograms (max. per dose 50 mg), to be administered at a rate not exceeding 5 mg/minute, to neutralise each 100 units of unfractionated heparin

Overdosage with subcutaneous injection of unfractionated heparin
  - BY INTRAVENOUS INJECTION, OR BY CONTINUOUS INTRAVENOUS INFUSION
  - Child: (max. per dose 50 mg), to be administered by intermittent intravenous injection at a rate not exceeding 5 mg/minute or by continuous intravenous infusion, 1 mg neutralises approx. 100 units of low molecular weight heparin

- **CAUTIONS**
  Excessive doses can have an anticoagulant effect

- **SIDE-EFFECTS**
  Anaphylaxis • angioedema • back pain • bradycardia • dyspnoea • flushing • hypersensitivity reactions • hypertension • hypotension • lassitude • nausea • pulmonary oedema • rebound bleeding • vomiting

- **ALLERGY AND CROSS-SENSITIVITY**
  Caution if increased risk of allergic reaction to protamine (includes previous treatment with protamine or protamine insulin, allergy to fish, men who are infertile or who have had a vasectomy and who may have antibodies to protamine).

- **MONITORING REQUIREMENTS**
  Monitor activated partial thromboplastin time or other appropriate blood clotting parameters.

- **DIRECTIONS FOR ADMINISTRATION**
  May be diluted if necessary with Sodium Chloride 0.9%.

- **PRESCRIBING AND DISPENSING INFORMATION**
  The long half-life of low molecular weight heparins should be taken into consideration when determining the dose of protamine sulfate; the effects of low molecular weight heparins can persist for up to 24 hours after administration.
3.4 Opioid toxicity

**OPIOID RECEPTOR ANTAGONISTS**

### Naloxone hydrochloride

#### INDICATIONS AND DOSE

**Overdosage with opioids**

- **BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**

- **Neonate**: Initially 100 micrograms/kg, if no response, repeat at intervals of 1 minute to a total max. 2 mg, then review diagnosis; further doses may be required if respiratory function deteriorates.

- **Child 1 month–11 years**: Initially 100 micrograms/kg, if no response, repeat at intervals of 1 minute to a total max. 2 mg, then review diagnosis; further doses may be required if respiratory function deteriorates

- **Child 12–17 years**: Initially 400 micrograms, then 800 micrograms for up to 2 doses at 1 minute intervals if no response to preceding dose, then increased to 2 mg for 1 dose if still no response (4 mg dose may be required in seriously poisoned patients), then review diagnosis; further doses may be required if respiratory function deteriorates

- **BY CONTINUOUS INTRAVENOUS INFUSION**

- **Neonate**: Using an infusion pump, adjust rate according to response (initially, rate may be set at 60% of the initial resuscitative intravenous injection dose per hour). The initial resuscitative intravenous injection dose is that which maintained satisfactory ventilation for at least 15 minutes.

- **Child**: Using an infusion pump, adjust rate according to response (initially, rate may be set at 60% of the initial resuscitative intravenous injection dose per hour). The initial resuscitative intravenous injection dose is that which maintained satisfactory ventilation for at least 15 minutes

#### Reversal of postoperative respiratory depression

- **INITIALLY BY INTRAVENOUS INJECTION**

- **Neonate**: 1 microgram/kg, repeated every 2–3 minutes if required.

- **Child 1 month–11 years**: 1 microgram/kg, repeated every 2–3 minutes if required

- **Child 12–17 years**: Initially 100–200 micrograms, alternatively (by intravenous injection) initially 1.5–3 micrograms/kg, if response inadequate, give subsequent doses, (by intravenous injection) 100 micrograms every 2 minutes, alternatively (by intramuscular injection) 100 micrograms every 1–2 hours

#### Reversal of respiratory and CNS depression resulting from opioid administration to mother during labour

- **BY INTRAMUSCULAR INJECTION**

- **Neonate**: 200 micrograms, alternatively 60 micrograms/kg, to be given as a single dose at birth.

- **BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION**

- **Neonate**: 10 micrograms/kg, repeated every 2–3 minutes if required.
3.5 Paracetamol toxicity

ANTIDOTES AND CHELATORS

Acetylcysteine

- **INDICATIONS AND DOSE**
  - **Paracetamol overdose**
    - **BY INTRAVENOUS INFUSION**
      - Neonate: Initially 150 mg/kg over 1 hour, dose to be administered in 3 mL/kg glucose 5%, followed by 50 mg/kg over 4 hours, dose to be administered in 7 mL/kg glucose 5%, then 100 mg/kg over 16 hours, dose to be administered in 14 mL/kg glucose 5%.
      - Child (body-weight up to 20 kg): Initially 150 mg/kg over 1 hour, dose to be administered in 3 mL/kg glucose 5%, followed by 50 mg/kg over 4 hours, dose to be administered in 7 mL/kg glucose 5%, then 100 mg/kg over 16 hours, dose to be administered in 14 mL/kg glucose 5%.
      - Child (body-weight 20–39 kg): Initially 150 mg/kg over 1 hour, dose to be administered in 100 mL glucose 5%, followed by 50 mg/kg over 4 hours, dose to be administered in 250 mL glucose 5%, then 100 mg/kg over 16 hours, dose to be administered in 500 mL glucose 5%.
      - Child (body-weight 40 kg and above): 150 mg/kg over 1 hour, dose to be administered in 200 mL Glucose Intravenous Infusion 5%, then 50 mg/kg over 4 hours, to be started immediately after completion of first infusion, dose to be administered in 500 mL Glucose Intravenous Infusion 5%, then 100 mg/kg over 16 hours, to be started immediately after completion of second infusion, dose to be administered in 1 litre Glucose Intravenous Infusion 5%.

- **Meconium ileus**
  - **BY MOUTH**
    - Neonate: 200–400 mg up to 3 times a day if required.

- **Treatment of distal intestinal obstructive syndrome**
  - **BY MOUTH**
    - Child 1 month–1 year: 0.4–3 g as a single dose
    - Child 2–6 years: 2–3 g as a single dose
    - Child 7–17 years: 4–6 g as a single dose

- **Prevention of distal intestinal obstruction syndrome**
  - **BY MOUTH**
    - Child 1 month–1 year: 100–200 mg 3 times a day
    - Child 2–3 years: 200 mg 3 times a day
    - Child 12–17 years: 200–400 mg 3 times a day

- **DOSES AT EXTREMES OF BODY-WEIGHT**
  - To avoid excessive dosage in obese patients, a ceiling weight of 110 kg should be used when calculating the dose for paracetamol overdosage.

- **UNLICENSED USE**
  - Not licensed for use in meconium ileus or for distal intestinal obstructive syndrome in children with cystic fibrosis.

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE; INTRAVENOUS ACETYLCYSTEINE FOR PARACETAMOL OVERDOSE: REMINDER OF AUTHORISED DOSE REGIMEN; POSSIBLE NEED FOR CONTINUED TREATMENT (JANUARY 2017)

The authorised dose regimen for acetylcysteine in paracetamol overdose is 3 consecutive intravenous infusions given over a total of 21 hours.

Continued treatment (given at the dose and rate as used in the third infusion) may be necessary depending on the clinical evaluation of the individual patient.

- **CAUTIONS**
  - With intravenous use Asthma (see Side-effects for management of asthma but do not delay acetylcysteine treatment) • atopy • may slightly increase INR • may slightly increase prothrombin time
  - With oral use Asthma • history of peptic ulceration

- **SIDE-EFFECTS**
  - With intravenous use Hypersensitivity-like reactions • rashes • slight increase in INR and prothrombin time
  - With oral use Anaphylaxis • Hypersensitivity-like reactions • rashes

**SIDE-EFFECTS, FURTHER INFORMATION**

- Hypersensitivity-like reactions
  - With intravenous use Hypersensitivity-like reactions managed by reducing infusion rate or suspending until reaction settled (rash also managed by giving antihistamine; acute asthma managed by giving nebulised short-acting beta agonist)—contact the National Poisons Information Service if reaction severe.

- **DIRECTIONS FOR ADMINISTRATION**
  - With oral use For oral administration, use oral granules, or dilute injection solution (200 mg/mL) to a concentration of 50 mg/mL; orange or blackcurrant juice or cola drink may be used as a diluent to mask the bitter taste.
  - With intravenous use Glucose 5% is preferred fluid; Sodium Chloride 0.9% is an alternative if Glucose 5% unsuitable.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Granules**

- **CAUTIONARY AND ADVISORY LABELS**
  - **Acetylcysteine (Non-proprietary)**
    - Acetylcysteine 100 mg Fluimucil N 100mg granules sachets | 20 sachet (PAX) no price available | 50 sachet (PAX) no price available
    - Acetylcysteine 200 mg Fluimucil N 200mg granules sachets | 20 sachet (PAX) no price available | 50 sachet (PAX) no price available | 100 sachet (PAX) no price available
    - A-CYS (Ennogen Healthcare Ltd)
      - Acetylcysteine 200 mg A-CYS 200mg granules sachets | 20 sachet £75.00

- **Solution for infusion**
  - **ELECTROLYTES:** May contain Sodium
    - **Acetylcysteine (Non-proprietary)**
      - Acetylcysteine 200 mg per 1 ml Acetylcysteine 2g/10ml solution for infusion ampoules | 10 ampoule (PAX) £21.26–£24.99
      - Parvolex (Phoenix Labs Ltd)
      - Acetylcysteine 200 mg per 1 ml Parvolex 2g/10ml concentrate for solution for infusion ampoules | 10 ampoule (PAX) £22.50

4 Methaemoglobinaemia

ANTIDOTES AND CHELATORS

Methylthioninium chloride

(Methylene blue)

- **INDICATIONS AND DOSE**
  - **Drug- or chemical-induced methaemoglobinaemia**
    - **BY SLOW INTRAVENOUS INJECTION**
      - Neonate: Seek advice from National Poisons Information Service.
      - Child 1–2 months: Seek advice from National Poisons Information Service
      - Child 3 months–17 years: Initially 1–2 mg/kg, then 1–2 mg/kg after 30–60 minutes if required, to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 7 mg/kg per course
Aniline- or dapsone-induced methaemoglobinaemia

**BY SLOW INTRAVENOUS INJECTION**

- Child 3 months–17 years: Initially 1–2 mg/kg, then 1–2 mg/kg after 30–60 minutes if required, to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 4 mg/kg per course

**CAUTIONS**

- Children under 3 months (more susceptible to methaemoglobinaemia from high doses of methylthioninium) - chlorate poisoning (reduces efficacy of methylthioninium) - G6PD deficiency (seek advice from National Poisons Information Service)
- Methaemoglobinaemia due to treatment of cyanide poisoning with sodium nitrite (seek advice from National Poisons Information Service)
- Pulse oximetry may give false estimation of oxygen saturation

**INTERACTIONS**

- Appendix 1: methylthioninium chloride

**SIDE-EFFECTS**

- Abdominal pain
- Agitation
- Anxiety
- Arrhythmia
- Blue-green discoloration of faeces
- Blue-green discoloration of skin
- Blue-green discoloration of urine
- Chest pain
- Confusion
- Dizziness
- Dyspnoea
- Fever
- Haemolytic anaemia
- Headache
- Hyperbilirubinaemia (in infants)
- Hypertension
- Hypotension
- Methaemoglobinaemia
- Mydriasis
- Nausea
- Sweating
- Tachypnoea
- Tremor
- Vomiting

**PREGNANCY**

- No information available, but risk to fetus of untreated methaemoglobinaemia likely to be significantly higher than risk of treatment.

**BREAST FEEDING**

- Manufacturer advises avoid breastfeeding for up to 6 days after administration — no information available.

**RENFAL IMPAIRMENT**

- Use with caution in severe impairment; dose reduction may be required.

**DIRECTIONS FOR ADMINISTRATION**

- By intravenous injection given over 10–15 minutes or by intravenous infusion over 30 minutes after diluting in sodium chloride 0.9% (use 5 mL diluent/kg body-weight).

**PRESCRIBING AND DISPENSING INFORMATION**

- To order, email immform@dh.gsi.gov.uk.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- European viper snake venom antiserum (Non-proprietary)
  - European viper snake venom antiserum 100 mg per 1 ml Viper venom antiserum, European (equine) 1 g/10 ml solution for injection vials | 1 vial [POM] no price available

---

5 Snake bites

**IMMUNE SERA AND IMMUNOGLOBULINS**

**ANTITOXINS**

## European viper snake venom antiserum

**INDICATIONS AND DOSE**

- Systemic envenoming from snake bites | Marked local envenoming
- Child: Initially 10 mL for 1 dose, then 10 mL after 1–2 hours if required, the second dose should only be given if symptoms of systemic envenoming persist after the first dose, if symptoms of systemic envenoming persist contact the National Poisons Information Service

---

Severe systemic envenoming from snake bites in patients presenting with clinical features

**BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**

- Child: Initially 20 mL for 1 dose, if symptoms of systemic envenoming persist contact the National Poisons Information Service
Appendix 1

Interactions

Changes have been made to Appendix 1. For more information, see www.bnf.org.

Two or more drugs given at the same time can exert their effects independently or they can interact. Interactions may be beneficial and exploited therapeutically; this type of interaction is not within the scope of this appendix. Many interactions are harmless, and even those that are potentially harmful can often be managed, allowing the drugs to be used safely together. Nevertheless, adverse drug interactions should be reported to the Medicines and Healthcare products Regulatory Agency (MHRA), through the Yellow Card Scheme (see Adverse Reactions to Drugs, p. 12), as for other adverse drug reactions.

Potentially harmful drug interactions may occur in only a small number of patients, but the true incidence is often hard to establish. Furthermore the severity of a harmful interaction is likely to vary from one patient to another. Patients at increased risk from drug interactions include the elderly and those with impaired renal or hepatic function.

Interactions can result in the potentiation or antagonism of one drug by another, or result in another effect, such as renal impairment. Drug interactions may develop either through pharmacokinetic or pharmacodynamic mechanisms.

**Pharmacodynamic interactions**
These are interactions between drugs that have similar or antagonistic pharmacological effects or side-effects. They might be due to competition at receptor sites, or occur between drugs acting on the same physiological system. They are usually predictable from a knowledge of the pharmacology of the interacting drugs; in general, those demonstrated with one drug are likely to occur with related drugs.

**Pharmacokinetic interactions**
These occur when one drug alters the absorption, distribution, metabolism, or excretion of another, thus increasing or decreasing the amount of drug available to produce its pharmacological effects. Pharmacokinetic interactions occurring with one drug do not necessarily occur uniformly across a group of related drugs.

**Affecting absorption**
The rate of absorption and the total amount absorbed can both be altered by drug interactions. Delayed absorption is rarely of clinical importance unless a rapid effect is required (e.g. when giving an analgesic). Reduction in the total amount absorbed, however, can result in ineffective therapy.

**Affecting distribution**
*Due to changes in protein binding*
To a variable extent most drugs are loosely bound to plasma proteins. Protein-binding sites are non-specific and one drug can displace another thereby increasing the proportion free to diffuse from the plasma to its site of action. This only produces a detectable increase in effect if it is an extensively bound drug (more than 90%); that is not widely distributed throughout the body. Even so displacement rarely produces more than transient potentiation because this increased concentration of free drug will usually be eliminated. Displacement from protein binding does play a part in the potentiation of warfarin by sulfonamides but these interactions become clinically relevant mainly because warfarin metabolism is also inhibited.

**Induction or inhibition of drug transporter proteins**
Drug transporter proteins, such as P-glycoprotein, actively transport drugs across biological membranes. Transporters can be induced or inhibited, resulting in changes in the concentrations of drugs that are substrates for the transporter. For example, rifampicin induces P-glycoprotein, particularly in the gut wall, resulting in decreased plasma concentrations of digoxin, a P-glycoprotein substrate.

**Affecting metabolism**
Many drugs are metabolised in the liver. Drugs are either metabolised by phase I reactions (oxidation, reduction, or hydrolysis) or by phase II reactions (e.g. glucuronidation).

Phase I reactions are mainly carried out by the cytochrome P450 family of isoenzymes, of which CYP3A4 is the most important isoenzyme involved in the metabolism of drugs. Induction of cytochrome P450 isoenzymes by one drug can increase the rate of metabolism of another, resulting in lower plasma concentrations and a reduced effect. On withdrawal of the inducing drug, plasma concentrations increase and toxicity can occur.

Conversely when one drug inhibits cytochrome P450 isoenzymes, it can decrease the metabolism of another, leading to higher plasma concentrations, resulting in an increased effect with a risk of toxicity.

Isoenzymes of the hepatic cytochrome P450 system interact with a wide range of drugs. With knowledge of which isoenzymes are involved in a drug’s metabolism, it is possible to predict whether certain pharmacokinetic interactions will occur. For example, carbamazepine is a potent inducer, ketoconazole is a potent inhibitor, and midazolam is a substrate of CYP3A4. Carbamazepine increases midazolam concentrations, and it is therefore likely that other drugs that are potent inducers of CYP3A4 will interact similarly with midazolam. Ketoconazole, however, increases midazolam concentrations, and it can be predicted that other drugs that are potent inhibitors of CYP3A4 will interact similarly.

Less is known about the enzymes involved in phase II reactions. These include UDP-glucuronoyltransferases which, for example, might be induced by rifampicin, resulting in decreased metabolism of mycophenolate (a substrate for this enzyme) to its active form, mycophenolic acid.

**Affecting renal excretion**
Drugs are eliminated through the kidney both by glomerular filtration and by active tubular secretion. Competition occurs between those which share active transport mechanisms in the proximal tubule. For example, salicylates and some other NSAIDs delay the excretion of methotrexate; serious methotrexate toxicity is possible. Changes in urinary pH can also affect the reabsorption of a small number of drugs, including methenamine.
Appendix 1

Relative importance of interactions

Severity of interactions

Most interactions have been assigned a severity; this describes the likely effect of an unmanaged interaction on the patient.

- **Severe** – the result may be a life-threatening event or have a permanent detrimental effect.
- **Moderate** – the result could cause considerable distress or partially incapacitate a patient; they are unlikely to be life-threatening or result in long-term effects.
- **Mild** – the result is unlikely to cause concern or incapacitate the majority of patients.
- **Unknown** – used for those interactions that are predicted, but there is insufficient evidence to hazard a guess at the outcome.

Evidence for interactions

Most interactions have been assigned a rating to indicate the weight of evidence behind the interaction.

- **Study** – for interactions where the information is based on formal study including those for other drugs with the same mechanism (e.g. known inducers, inhibitors, or substrates of cytochrome P450 isoenzymes or P-glycoprotein).
- **Anecdotal** – interactions based on either a single case report or a limited number of case reports.
- **Theoretical** – interactions that are predicted based on sound theoretical considerations. The information may have been derived from in vitro studies or based on the way other members in the same class act.

Appendix 1 structure

1. Drugs

Drugs are listed alphabetically. If a drug is a member of a drug class, all interactions for that drug will be listed under the drug class entry; in this case the drug entry provides direction to the relevant drug class where its interactions can be found.

Within a drug or drug class entry, interactions are listed alphabetically by the interacting drug or drug class. The interactions describe the effect that occurs, and the action to be taken, either based on manufacturer’s advice from the relevant Summary of Product Characteristics or advice from a relevant authority (e.g. MHRA). An action message is only included where the combination is to be avoided, where a dose adjustment is required, or where specific administration requirements (e.g. timing of doses) are recommended. If two drugs have a pharmacodynamic effect in addition to a pharmacokinetic interaction, a cross-reference to the relevant pharmacodynamic effect table is included at the end of the pharmacokinetic message.

2. Drug classes

The drugs that are members of a drug class are listed underneath the drug class entry in a blue box. Interactions for the class are then listed alphabetically by the interacting drug or drug class. If the interaction only applies to certain drugs in the class, these drugs will be shown in brackets after the drug class name.

3. Supplementary information

If a drug has additional important information to be considered, this is shown in a blue box underneath the drug or drug class entry. This information might be food and lifestyle advice (including smoking and alcohol consumption), relate to the pharmacology of the drug or applicability of interactions to certain routes of administration, or it might be advice about separating administration times.

4. Pharmacodynamic effects

Tables at the beginning of Appendix 1 cover pharmacodynamic effects. If a drug is included in one or more of these tables, this will be indicated at the top of the list of interactions for the drug or drug class. In addition to the list of interactions for a drug or drug class, these tables should always be consulted.

Each table describes the relevant pharmacodynamic effect and lists those drugs that are commonly associated with the effect. Concurrent use of two or more drugs from the same table is expected to increase the risk of the pharmacodynamic effect occurring. Please note these tables are not exhaustive.

Other than for QT interval prolongation, actions for pharmacodynamic effects are not included in the BNF, as these will depend on individual patient circumstances.
### TABLE 1
**Drugs that cause hepatotoxicity**
The following is a list of some drugs that cause hepatotoxicity (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

820 Appendix 1 Interactions

BNFC 2017–2018

TABLE 9

Drugs that prolong the QT interval
The following is a list of some drugs that prolong the QT-interval (note that this list is not exhaustive). In general, manufacturers advise
that the use of two or more drugs that are associated with QT prolongation should be avoided. Increasing age, female sex, cardiac
disease, and some metabolic disturbances (notably hypokalaemia) predispose to QT prolongation—concurrent use of drugs that
reduce serum potassium might further increase this risk (see table of drugs that reduce serum potassium).
Drugs that are not known to prolong the QT interval but are predicted (by the manufacturer) to increase the risk of QT prolongation
include: domperidone, erythromycin, fingolimod, granisetron, ivabradine, mefloquine, mizolastine, palonosetron, and pentamidine. Most
manufacturers advise avoiding concurrent use with drugs that prolong the QT interval.
amifampridine
amiodarone
amisulpride
apomorphine
arsenic trioxide
artemether
artenimol
bedaquiline
bosutinib
cabozantinib
ceritinib
chlorpromazine
citalopram

tizanidine
tolterodine
toremifene
vandetanib
vardenafil
vemurafenib
venlafaxine
vinflunine
voriconazole
zuclopenthixol

TABLE 10

Drugs with antimuscarinic effects
The following is a list of some drugs that have antimuscarinic effects (note that this list is not exhaustive). Concurrent use of two or more
drugs from this list might increase the risk of these effects occurring.
aclidinium
amantadine
amitriptyline
atropine
baclofen
chlorphenamine
chlorpromazine
clemastine
clomipramine
clozapine
cyclizine

cyclopentolate
cyproheptadine
darifenacin
dicycloverine
dimenhydrinate
disopyramide
dosulepin
doxepin
fesoterodine
flavoxate
glycopyrronium

haloperidol
homatropine
hydroxyzine
hyoscine
imipramine
ipratropium
levomepromazine
lofepramine
loxapine
nefopam
nortriptyline

orphenadrine
oxybutynin
perphenazine
pimozide
prochlorperazine
procyclidine
promethazine
propafenone
propantheline
propiverine
solifenacin

tiotropium
tolterodine
trifluoperazine
trihexyphenidyl
trimipramine
tropicamide
trospium
umeclidinium

TABLE 11

Drugs with CNS depressant effects
The following is a list of some drugs with CNS depressant effects (note that this list is not exhaustive). Concurrent use of two or more
drugs from this list might increase the risk of CNS depressant effects, such as drowsiness, which might affect the ability to perform
skilled tasks (see Drugs and Driving p. 3).
agomelatine
alcohol (beverage)
alfentanil
alimemazine
alprazolam
amisulpride
apraclonidine
aripiprazole
articaine
asenapine
baclofen
benperidol
brimonidine
buclizine
bupivacaine
buprenorphine
cannabis extract
chloral hydrate
chlordiazepoxide
chloroprocaine
chlorphenamine
chlorpromazine
cinnarizine
clemastine

clomethiazole
clonazepam
clonidine
clozapine
codeine
cyclizine
cyproheptadine
desflurane
dexmedetomidine
diamorphine
diazepam
dihydrocodeine
dipipanone
droperidol
etomidate
fentanyl
flupentixol
fluphenazine
flurazepam
gabapentin
guanfacine
haloperidol
hydromorphone
hydroxyzine

isoflurane
ketamine
ketotifen
lamotrigine
levetiracetam
levomepromazine
lidocaine
lofexidine
loprazolam
lorazepam
lormetazepam
loxapine
lurasidone
melatonin
mepivacaine
meprobamate
meptazinol
methadone
methocarbamol
mianserin
midazolam
mirtazapine
morphine
moxonidine

nabilone
nitrazepam
nitrous oxide
olanzapine
oxazepam
oxycodone
paliperidone
papaveretum
pentazocine
perampanel
pericyazine
perphenazine
pethidine
phenobarbital
pimozide
pizotifen
pregabalin
prilocaine
primidone
prochlorperazine
promazine
promethazine
propofol
quetiapine

remifentanil
risperidone
ropivacaine
sevoflurane
sodium oxybate
sufentanil
sulpiride
tapentadol
temazepam
tetracaine
thalidomide
thiopental
tizanidine
tramadol
trazodone
trifluoperazine
venlafaxine
zaleplon
zolpidem
zopiclone
zuclopenthixol

### TABLE 16
#### Drugs that increase serum potassium
The following is a list of some drugs that increase serum potassium concentrations (note that this list is not exhaustive). Concurrent use of two or more drugs from this list might increase the risk of hyperkalaemia. Hyperkalaemia is particularly notable when ACE inhibitors or angiotensin-II receptor antagonists are given with spironolactone or eplerenone.

### TABLE 17
#### Drugs that reduce serum potassium
The following is a list of some drugs that reduce serum potassium concentrations (note that this list is not exhaustive). Concurrent use of two or more drugs from this list might increase the risk of hypokalaemia. Hypokalaemia can increase the risk of torsade de pointes, which might be additive with the effects of drugs that prolong the QT interval.

List of drug interactions

The following is an alphabetical list of drugs and their interactions; to avoid excessive cross-referencing each drug or group is listed twice: in the alphabetical list and also against the drug or group with which it interacts.

**Abacavir**

- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to abacavir. [Moderate] Theoretical
- **Enalaprilat** is predicted to decrease the exposure to abacavir. [Moderate] Theoretical
- **HIV-protase inhibitors** (amprenavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to decrease the increase in the concentration of abacavir. [Severe] Theoretical
- **Rifampicin** is predicted to decrease the exposure to abacavir. [Moderate] Theoretical

**Abatacept**

- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with abatacept. Public Health England advises avoids. [Severe] Theoretical

**Abciximab** → **TABLE 4** p. 818 (antiplatelet effects)

**Abiraterone**

**GENERAL INFORMATION** Caution with concurrent chemotherapy—safety and efficacy not established.

- **Abiraterone** is predicted to increase the exposure to antiarrhythmics (flecainide). [Severe] Theoretical
- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to increase the exposure to abiraterone. Avoid. [Severe] Theoretical
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to abiraterone. [Severe] Theoretical
- **Abiraterone** is predicted to increase the exposure to beta blockers, non-selective (carvedilol, timolol). [Moderate] Theoretical
- **Abiraterone** is predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). [Moderate] Study
- **Cobicistat** is predicted to increase the exposure to abiraterone. [Severe] Theoretical
- **Enalaprilat** is predicted to decrease the exposure to abiraterone. Avoid. [Severe] Theoretical
- **HIV-protase inhibitors** (amprenavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to abiraterone. [Severe] Theoretical
- **Macroldes (clarithromycin)** are predicted to increase the exposure to abiraterone. [Severe] Theoretical
- **Abiraterone** is predicted to decrease the efficacy of opioids (tramadol). [Moderate] Study
- **Abiraterone** is predicted to increase the exposure to pilocilasant. Use with caution and adjust dose. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to abiraterone. Avoid. [Severe] Theoretical
- **Abiraterone** potentially increases the exposure to venlafaxine. [Severe] Theoretical
- **Acarbose** → **TABLE 14** p. 821 (antidiabetic drugs)
- **Acarbose** decreases the concentration of digoxin. [Moderate] Study
- **Pancreatin** is predicted to decrease the effects of acarbose. Avoid. [Moderate] Theoretical
- **ACE inhibitors** → **TABLE 7** p. 819 (first-dose hypotension), **TABLE 8** p. 819 (hypotension), **TABLE 16** p. 822 (increased serum potassium)
  - Captopril, enalapril, fosinopril, imidapril, lisinopril, moexipril, perindopril, quinapril, ramipril, trandolapril
  - **ACE inhibitors** increase the risk of renal impairment when given with aliskiren. Use with caution or avoid aliskiren in selected patients. [Severe] Study → Also see **TABLE 8** p. 819 → Also see **TABLE 16** p. 822
  - **ACE inhibitors** are predicted to increase the risk of hypersensitivity and haemato logical reactions when given with allopurinol. [Severe] Anecdotal

**ACE inhibitors** are predicted to increase the risk of anaemia and/or leucopenia when given with azathioprine. [Severe] Anecdotal

**ACE inhibitors** increase the risk of hypersensitivity when given with bee venom extract. Avoid. [Severe] Study

**ACE inhibitors** are predicted to decrease the efficacy of icatibant and icatibant is predicted to decrease the efficacy of ACE inhibitors. Avoid. [Moderate] Theoretical

**ACE inhibitors** are predicted to increase the concentration of lithium. Monitor and adjust dose. [Severe] Anecdotal

**ACE inhibitors** are predicted to increase the risk of hypersensitivity when given with sodium aurothiomalate. [Severe] Anecdotal

Quinapril (tablet) decreases the absorption of oral tetracyclines (tetracycline). Avoid. [Moderate] Study

**ACE inhibitors** increase the risk of hypersensitivity when given with wasp venom extract. Avoid. [Severe] Study

**Acetabutol** → see beta blockers, selective

**Acetamidophen** → see NSAIDs

**Acemetacin** → see NSAIDs

**Acenocoumarol** → see coumarins

**Acetazolamide**

- **Acetazolamide** potentially increases the risk of overheating and dehydration when given with antiepileptics (zonisamide). Avoid in children. [Severe] Theoretical
- **Acetazolamide** increases the risk of severe toxic reaction when given with aspirin (high-dose). [Severe] Study
- **Acetazolamide** alters the concentration of lithium. [Severe] Anecdotal
- **Acetazolamide** is predicted to decrease the efficacy of methemamine. Avoid. [Moderate] Theoretical
- **Acetazolamide** increases the urinary excretion of methotrexate. [Moderate] Study

**Aciclovir** → **TABLE 2** p. 818 (nephrotoxicity)

**ROUTE-SPECIFIC INFORMATION** Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

**Aciclovir** increases the exposure to amphotericin. Monitor theophylline concentration and adjust dose. [Severe] Anecdotal

**Mycofenolate** is predicted to increase the risk of haematological toxicity when given with aciclovir. [Moderate] Theoretical

**Aciclovir** is predicted to increase the exposure to theophylline. Monitor theophylline concentration and adjust dose. [Severe] Theoretical

**Aciclovir** → see retinoids

**Aciclovir** → see TABLE 10 p. 820 (antimycosanis)

**Acivicline** → see antihistamines, non-sedating

**Adalimumab** → see monoclonal antibodies

**Adaludale** → see retinoids

**Adefovir**

- **Ataluren** increases the exposure to adefovir. [Moderate] Study
- **Adenosine** → see antiarrhythmics
- **Adrenaline/pinephrine** → see sympathomimetics, vasocostructor
- **Afatinib** → **TABLE 15** p. 821 (myelosuppression)
  - **Antiarrhythmics (amiodarone, dronedarone)** are predicted to increase the exposure to afatinib. Separate administration by 12 hours. [Moderate] Study
  - **Antiepileptics (carbamazepine)** are predicted to decrease the exposure to afatinib. [Moderate] Study
  - **Antifungals, azoles (itraconazole, ketoconazole)** are predicted to increase the exposure to afatinib. Separate administration by 12 hours. [Moderate] Study
  - **Calcium channel blockers (verapamil)** are predicted to increase the exposure to afatinib. Separate administration by 12 hours. [Moderate] Study
  - **Ciclosporin** is predicted to increase the exposure to afatinib. Separate administration by 12 hours. [Moderate] Study
  - **HIV-protase inhibitors (lopinavir, ritonavir, saquinavir)** are predicted to increase the exposure to afatinib. Separate administration by 12 hours. [Moderate] Study
  - **Lapatinib** is predicted to increase the exposure to afatinib. Separate administration by 12 hours. [Moderate] Study

**Macrolides** are predicted to increase the exposure to afatinib. Separate administration by 12 hours. [Moderate] Study

**Afatinib** is predicted to increase the risk of anaemia and/or leucopenia when given with azathioprine. [Severe] Anecdotal

**Afatinib** increase the risk of hypersensitivity when given with bee venom extract. Avoid. [Severe] Study

**Afatinib** are predicted to decrease the efficacy of icatibant and icatibant is predicted to decrease the efficacy of ACE inhibitors. Avoid. [Moderate] Theoretical

**Afatinib** are predicted to increase the concentration of lithium. Monitor and adjust dose. [Severe] Anecdotal

**Afatinib** are predicted to increase the risk of hypersensitivity when given with sodium aurothiomalate. [Severe] Anecdotal

**Quinapril** (tablet) decreases the absorption of oral tetracyclines (tetracycline). Avoid. [Moderate] Study

**Afatinib** increase the risk of hypersensitivity when given with wasp venom extract. Avoid. [Severe] Study
Afatinib (continued)

- **Ranolazine** is predicted to increase the exposure to afatinib. Separate administration by 12 hours. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to afatinib. [Moderate] Study
- **St John’s Wort** is predicted to decrease the exposure to afatinib. Separate administration by 12 hours. [Moderate] Study
- **Vemurafenib** is predicted to increase the exposure to afatinib. Separate administration by 12 hours. [Moderate] Study

Afibercept → see TABLE 15 p. 821 (myelosuppression)

Agalsidase

- **Aminoglycosides** are predicted to decrease the effects of agalsidase. Avoid. [Moderate] Theoretical
- **Antiarhythmics (amiodarone)** are predicted to decrease the effects of agalsidase. Avoid. [Moderate] Theoretical
- **Antimalarials (chloroquine)** are predicted to decrease the effects of agalsidase. Avoid. [Moderate] Theoretical
- **Hydroxychloroquine** is predicted to decrease the effects of agalsidase. [Moderate] Theoretical

Agomelatine → see TABLE 11 p. 820 (CNS depressant effects)

- Dose adjustment might be necessary if smoking started or stopped during treatment.
- Caution with concomitant use of drugs associated with hepatic injury.
- **Antiepileptics (fosphenytoin, phenytoin)** are predicted to decrease the exposure to agomelatine. [Moderate] Theoretical
- **Combined hormonal contraceptives** are predicted to increase the exposure to agomelatine. [Moderate] Study
- **HIV-protease inhibitors (ritonavir)** are predicted to decrease the exposure to agomelatine. [Moderate] Theoretical
- **Quinolones (ciprofloxacin)** are predicted to increase the exposure to agomelatine. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to agomelatine. [Moderate] Theoretical
- **SSRIs (fluvoxamine)** very markedly increase the exposure to agomelatine. Avoid. [Severe] Study

Albendazole

- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** decrease the concentration of albendazole. [Moderate] Study
- **H₂ receptor antagonists (cimetidine)** decrease the clearance of albendazole. [Moderate] Study
- **HIV-protease inhibitors (ritonavir)** decrease the exposure to albendazole. [Moderate] Study
- **Albendazole slightly decreases the exposure to levamisole and levamisole moderately decreases the exposure to albendazole.** [Moderate] Study

Albiglutide → see TABLE 14 p. 821 (antidiabetic drugs)

Alcohol (beverage) → see TABLE 1 p. 818 (hepatotoxicity), TABLE 8 p. 819 (hypotension), TABLE 11 p. 820 (CNS depressant effects)

Aldosterone antagonists → see TABLE 18 p. 822 (hyponatraemia), TABLE 8 p. 819 (hypotension), TABLE 16 p. 822 (increased serum potassium)

Eplerenone - spironolactone

- **Antiarhythmics (amiodarone)** are predicted to increase the exposure to eplerenone. Adjust eplerenone dose. [Severe] Theoretical
- **Antiarhythmics (dronedarone)** are predicted to increase the exposure to eplerenone. Adjust eplerenone dose. [Severe] Study
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to eplerenone. Avoid. [Moderate] Theoretical → Also see TABLE 18 p. 822
- **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to eplerenone. Adjust eplerenone dose. [Severe] Study
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to markedly increase the exposure to eplerenone. Avoid. [Severe] Study
- **Aprepitant** is predicted to increase the exposure to eplerenone. Adjust eplerenone dose. [Severe] Study → Also see TABLE 8 p. 819
- **Cobicistat** is predicted to markedly increase the exposure to eplerenone. Avoid. [Severe] Study
- **Crizotinib** is predicted to increase the exposure to eplerenone. Adjust eplerenone dose. [Severe] Study
- **Eplerenone** very slightly increases the exposure to digoxin. [Minor] Study
- **Spironolactone** increases the concentration of digoxin. Monitor and adjust dose. [Moderate] Study
- **Enzalutamide** is predicted to decrease the exposure to eplerenone. Avoid. [Moderate] Theoretical
- **HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to markedly increase the exposure to eplerenone. Avoid. [Severe] Study
- **HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to eplerenone. Adjust eplerenone dose. [Severe] Study
- **Idelalisib** is predicted to markedly increase the exposure to eplerenone. Avoid. [Severe] Study
- **Imatinib** is predicted to increase the exposure to eplerenone. Adjust eplerenone dose. [Severe] Study
- **Eplerenone** is predicted to increase the concentration of lithium. Avoid. [Moderate] Theoretical
- **Spironolactone** potentially increases the concentration of lithium. [Moderate] Study
- **Macrolides (clarithromycin)** are predicted to markedly increase the exposure to eplerenone. Avoid. [Severe] Study
- **Macrolides (erythromycin)** are predicted to increase the exposure to eplerenone. Adjust eplerenone dose. [Severe] Study
- **Spironolactone** is predicted to decrease the effects of mitotane. Avoid. [Severe] Anecdotal
- **Netupitant** is predicted to increase the exposure to eplerenone. Adjust eplerenone dose. [Severe] Study
- **Nilotinib** is predicted to increase the exposure to eplerenone. Adjust eplerenone dose. [Severe] Study
- **Rifampicin** is predicted to decrease the exposure to eplerenone. Avoid. [Moderate] Theoretical
- **St John’s Wort** is predicted to slightly decrease the exposure to eplerenone. Avoid. [Moderate] Study

Alectuzumab → see monoclonal antibodies

Aldendronic acid → see bisphosphonates

Alfalcacidol → see vitamin D substances

Alfentanil → see opioids

Alfuzosin → see alpha blockers

Allermazime → see antihistamines, sedating

Alirocumab → see monoclonal antibodies

Aliskiren → see TABLE 8 p. 819 (hypotension), TABLE 16 p. 822 (increased serum potassium)

FOOD AND LIFESTYLE

Avoid apple juice and orange juice as they greatly decrease aliskiren concentrations and plasma renin activity.

- **ACE inhibitors** increase the risk of renal impairment when given with aliskiren. Use with caution or avoid aliskiren in selected patients. [Severe] Study → Also see TABLE 8 p. 819 → Also see TABLE 16 p. 822
- **Angiotensin-II receptor antagonists** increase the risk of renal impairment when given with aliskiren. Use with caution or avoid aliskiren in selected patients. [Severe] Study → Also see TABLE 8 p. 819 (hypotension). Also see TABLE 16 p. 822
- **Antiarhythmics (amiodarone, dronedarone)** are predicted to increase the exposure to aliskiren. [Severe] Study
- **Antiepileptics (carbamazepine)** decrease the exposure to aliskiren. [Moderate] Study
- **Antifungals, azoles (itraconazole)** markedly increase the exposure to aliskiren. Avoid. [Severe] Study
- **Antifungals, azoles (ketonazole)** moderately increase the exposure to aliskiren. [Moderate] Study
- **Calcium channel blockers (verapamil)** moderately increase the exposure to aliskiren. [Moderate] Theoretical
- **Ciclosporin** markedly increases the exposure to aliskiren. Avoid. [Severe] Study
- **Grapefruit juice** moderately decreases the exposure to aliskiren. Avoid. [Severe] Study
HIV-protease inhibitors (ritonavir, saquinavir) are predicted to increase the exposure to aliskiren. [Moderate] Theoretical

Lapatinib is predicted to increase the exposure to aliskiren. [Moderate] Theoretical

Aliskiren slightly decreases the exposure to loop diuretics (furosemide). [Moderate] Study ➔ Also see TABLE 8 p. 819

Lumacaftor is predicted to affect the exposure to aliskiren. [Moderate] Theoretical

Macrolides (azithromycin) are predicted to increase the exposure to aliskiren. [Moderate] Theoretical

Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to aliskiren. [Moderate] Study

Mirabegron is predicted to increase the exposure to aliskiren. [Mild] Theoretical

Ranolazine decreases the exposure to aliskiren. [Moderate] Study

St John's Wort decreases the exposure to aliskiren. [Moderate] Study

Statins (atorvastatin) slightly to moderately increase the exposure to aliskiren. [Moderate] Study

Velpatasvir is predicted to increase the exposure to aliskiren. [Moderate] Study

Paracetamol is predicted to decrease the clearance of aliskiren. [Moderate] Study

Aprepitant is predicted to increase the exposure to aliskiren. [Mild] Study

Cobicistat increases the exposure to aliskiren. [Mild] Study

Almotriptan is predicted to increase the exposure to aliskiren. [Mild] Theoretical

Alogliptin is predicted to increase the exposure to aliskiren. [Mild] Theoretical

Antacids are predicted to decrease the absorption of estramustine. Avoid. [Moderate] Study

Antifungals, azoles (itraconazole) increase the risk of busulfan toxicity when given with busulfan. Monitor and adjust dose. [Moderate] Study

Antifungals, azoles (miconazole) are predicted to increase the concentration of busulfan. Use with caution and adjust dose. [Moderate] Theoretical

Oral calcium salts decrease the absorption of estramustine. [Severe] Study

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with alkylating agents. Public Health England advises avoid. [Severe] Theoretical

Metronidazole increases the risk of toxicity when given with busulfan. [Severe] Study

Paracetamol is predicted to decrease the clearance of busulfan. [Moderate] Theoretical

Cyclophosphamide (high-dose) increases the risk of toxicity when given with pentostatin. Avoid. [Severe] Anecdotal ➔ Also see TABLE 15 p. 821 ➔ Also see TABLE 5 p. 818

Cyclophosphamide increases the risk of prolonged neuromuscular blockade when given with suxamethonium. [Moderate] Study

Allopurinol is predicted to increase the risk of hypersensitivity reactions when given with allopurinol. [Severe] Theoretical

ACE inhibitors are predicted to increase the risk of haematomatological toxicity when given with azathioprine. Adjust azathioprine dose. p. 495. [Severe] Study

Alloporinol is predicted to decrease the effects of capetitabine. Avoid. [Severe] Study

Alloporinol moderately increases the exposure to didanosine. Avoid. [Severe] Study

Alloporinol potentially increases the risk of haematological toxicity when given with mercaptopurine. Adjust mercaptopurine dose. p. 516. [Severe] Study

Alloporinol increases the risk of skin rash when given with penicillins (amoxicillin, ampicillin). [Moderate] Study

Alloporinol is predicted to increase the risk of hyperuricaemia when given with pyrazinamide. [Moderate] Theoretical

Thiazide diuretics are predicted to increase the risk of hypersensitivity reactions when given with allopurinol. [Severe] Theoretical

Almotriptan ➔ see TABLE 13 p. 821 (serotonin syndrome)

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to almotriptan. [Mild] Study

Cobicistat increases the exposure to almotriptan. [Mild] Study

Almotriptan is predicted to increase the risk of vasoconstriction when given with ergotamine. Ergotamine should be taken at least 24 hours before or 6 hours after almotriptan. [Severe] Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) increase the exposure to almotriptan. [Mild] Study

Idelalisib increases the exposure to almotriptan. [Mild] Study

Macrolides (clarithromycin) increase the exposure to almotriptan. [Mild] Study

Alloporinol ➔ see TABLE 14 p. 821 (anti-diabetic drugs)

Alpha blockers ➔ see TABLE 7 p. 819 (first-dose hypotension), TABLE 8 p. 819 (hypotension)

alfuzosin - doxazosin - indoramin - prazosin - tamsulosin - terazosin

Antihypertycics (dronedarone) are predicted to increase the exposure to tamsulosin. [Moderate] Theoretical

Antifungals, azoles (fluconazole, itraconazole, posaconazole) are predicted to increase the exposure to tamsulosin. [Moderate] Theoretical

Allopurinol increases the risk of skin rash when given with tamsulosin. [Moderate] Study

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to tamsulosin. [Moderate] Study ➔ Also see TABLE 8 p. 819

Cobicistat is predicted to moderately increase the exposure to alpha blockers (alfuzosin, tamsulosin). Use with caution or avoid. [Moderate] Study

Cobicistat is predicted to increase the exposure to doxazosin. [Moderate] Study

Crizotinib is predicted to increase the exposure to tamsulosin. [Moderate] Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to doxazosin. [Moderate] Study

HIV-protease inhibitors (indinavir) are predicted to increase the exposure to tamsulosin. [Moderate] Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to moderately increase the exposure to alpha blockers (alfuzosin, tamsulosin). Use with caution or avoid. [Moderate] Study

Idelalisib is predicted to moderately increase the exposure to alpha blockers (alfuzosin, tamsulosin). Use with caution or avoid. [Moderate] Study

Idelalisib is predicted to increase the exposure to doxazosin. [Moderate] Study

Idelalisib is predicted to increase the exposure to tamsulosin. [Moderate] Theoretical

Imatinib is predicted to increase the exposure to doxazosin. [Moderate] Study

Idelalisib is predicted to increase the exposure to tamsulosin. [Moderate] Theoretical

Nilotinib is predicted to increase the exposure to tamsulosin. [Moderate] Theoretical
Alpha blockers (continued)

- Alpha blockers cause significant hypotensive effects when given with phosphodiesterase type-5 inhibitors. Patient should be stabilised on first drug then second drug should be added at the lowest recommended dose. [Severe] Study → Also see TABLE 11 p. 820

Alpha tocopherol → see vitamin E substances

Alpha tocopheryl acetate → see vitamin E substances

Alprazolam → see TABLE 11 p. 820 (CNS depressant effects)

- Antiarrhythmics (dronedarone) are predicted to increase the exposure to alprazolam. [Severe] Study

- Antiplatelet agents (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to alprazolam. Adjust alprazolam dose. [Moderate] Theoretical → Also see TABLE 11 p. 820

- Antifungals, azoles (fluconazole, itraconazole, posaconazole) are predicted to increase the exposure to alprazolam. [Severe] Study

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) moderately increase the exposure to alprazolam. Avoid. [Moderate] Study

- Crizotinib is predicted to increase the exposure to alprazolam. [Severe] Study

- Enalapril is predicted to decrease the exposure to alprazolam. Adjust alprazolam dose. [Moderate] Theoretical

- HIV-protective agents (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) moderately increase the exposure to alprazolam. Avoid. [Moderate] Study

- HIV-protective agents (indinavir) are predicted to increase the exposure to alprazolam. [Severe] Study

- Idelalisib moderately increases the exposure to alprazolam. Avoid. [Moderate] Study

- Imatinib is predicted to increase the exposure to alprazolam. [Severe] Study

- Alprazolam is predicted to increase the exposure to loxapine. Separate administration by 12 hours. [Moderate] Theoretical

- Macrolides (clarithromycin) moderately increase the exposure to alprazolam. Avoid. [Moderate] Study

- Macrolides (erythromycin) are predicted to increase the exposure to alprazolam. [Severe] Study

- Netupitant is predicted to increase the exposure to alprazolam. [Severe] Study

- Nitritinib is predicted to increase the exposure to alprazolam. [Severe] Study

- Rifampicin is predicted to decrease the exposure to alprazolam. Adjust alprazolam dose. [Moderate] Theoretical

- SSRIs (fluvoxamine) moderately increase the exposure to alprazolam. Adjust dose. [Moderate] Study

- St John’s Wort moderately decreases the exposure to alprazolam. [Moderate] Study

Alprostadil → see TABLE 8 p. 819 (hypotension)

Atelisopase → see TABLE 3 p. 818 (anticoagulant effects)

Aluminium hydroxide → see antacids

Amanadine → see dopamine receptor agonists

Ambrisentan

- Ciclosporin moderately increases the exposure to ambrisentan. Adjust ambrisentan dose. [Moderate] Study

- Rifampicin transiently increases the exposure to ambrisentan. [Moderate] Study

Amfetamines → see TABLE 13 p. 821 (serotonin syndrome)

- Dexamfetamine decreases the effects of guanethidine. [Severe] Study

- HIV-protectase inhibitors (ritonavir, tipranavir) are predicted to increase the exposure to amfetamines. [Severe] Theoretical

- Moclobemide is predicted to increase the risk of a hypertensive crisis when given with dexamfetamine. Avoid. [Severe] Theoretical → Also see TABLE 13 p. 821

- Moclobemide is predicted to increase the risk of a hypertensive crisis when given with lisdexamfetamine. Avoid. [Severe] Theoretical → Also see TABLE 13 p. 821

- Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the risk of a hypertensive crisis when given with amfetamines. Avoid and for 14 days after stopping the MAOI. [Severe] Anecdotal → Also see TABLE 13 p. 821

- Monoamine-oxidase B inhibitors (rasagiline, selegiline) are predicted to increase the risk of severe hypertension when given with amfetamines. Avoid. [Severe] Theoretical → Also see TABLE 13 p. 821

- Monoamine-oxidase B inhibitors (safinamide) are predicted to increase the risk of severe hypertension when given with amfetamines. [Severe] Theoretical → Also see TABLE 13 p. 821

- Nabilone is predicted to increase the risk of cardiovascular side-effects when given with amfetamines. [Severe] Theoretical

- Phenothiazines are predicted to decrease the effects of amfetamines. [Moderate] Study

- Amfetamines are predicted to decrease the effects of phenothiazines (chlorpromazine). [Moderate] Study

- SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to amfetamines. [Severe] Theoretical → Also see TABLE 13 p. 821

Amifampridine → see TABLE 9 p. 820 (QT-interval prolongation)

Amitriptyline → see amineglicosides

Amiloride → see potassium-sparing diuretics

Amnoglycosides → see TABLE 2 p. 818 (neurotoxicity), TABLE 19 p. 822 (ototoxicity), TABLE 20 p. 822 (neuromuscular blocking effects)

- amikacin - gentamicin - streptomycin - tobramycin

- Aminoglycosides are predicted to decrease the effects of agalseidase. Avoid. [Moderate] Theoretical

- Antifungals, azoles (miconazole) potentially decrease the exposure to tobramycin. [Moderate] Anecdotal

- Ataluren is predicted to increase the risk of nephrotoxicity when given with intravenous aminoglycosides. Avoid. [Severe] Study

- Aminoglycosides increase the risk of hypocalcaemia when given with bisphosphonates. [Moderate] Anecdotal → Also see TABLE 2 p. 818

- Aminoglycosides potentially increase the concentration of digoxin. Monitor and adjust dose. [Mild] Study

- Loop diuretics increase the risk of nephrotoxicity and ototoxicity when given with aminoglycosides. Avoid. [Moderate] Study → Also see TABLE 19 p. 822

- Aminoglycosides are predicted to decrease the effects of neostigmine. [Moderate] Theoretical → Also see TABLE 20 p. 822

- Aminoglycosides are predicted to increase the risk of prolonged neuromuscular blockade when given with neuromuscular blocking drugs, non-depolarising. [Severe] Theoretical → Also see TABLE 20 p. 822

- Aminoglycosides are predicted to decrease the effects of pyridostigmine. [Moderate] Theoretical → Also see TABLE 20 p. 822

- Aminoglycosides are predicted to increase the risk of prolonged neuromuscular blockade when given with suxamethonium. [Severe] Theoretical → Also see TABLE 20 p. 822

- Telavancin is predicted to increase the risk of ototoxicity when given with aminoglycosides. [Moderate] Theoretical → Also see TABLE 2 p. 818 → Also see TABLE 19 p. 822

- Vancomycin increases the risk of nephrotoxicity when given with aminoglycosides. Avoid. [Moderate] Study → Also see TABLE 2 p. 818 → Also see TABLE 19 p. 822

Aminophylline → see TABLE 17 p. 822 (reduced serum potassium)

FOOD AND LIFESTYLE Smoking can increase aminophylline clearance and increased doses of aminophylline are therefore required; dose adjustments are likely to be necessary if smoking started or stopped during treatment.
▶ Aciclovir increases the exposure to aminophylline. Monitor theophylline concentration and adjust dose. (Severe) Anecdotal

▶ Aminophylline is predicted to decrease the efficacy of antiarrhythmics (adenosine). Separate administration by 24 hours. (Ritid) Theoretical

▶ Antiepileptics (phenytoin) are predicted to decrease the exposure to aminophylline. Adjust dose. (Moderate) Study

▶ Antiepileptics (phenytoin) are predicted to decrease the exposure to aminophylline. Adjust dose. (Moderate) Theoretical

▶ Antiepileptics (phenytoin) decrease the exposure to aminophylline. Adjust dose. (Moderate) Theoretical

▶ Antiepileptics are predicted to increase the exposure to aminophylline. Avoid. (Serious) Theoretical

▶ Antiepileptics are predicted to decrease the exposure to aminophylline.

▶ Antiepileptics (primidone) are predicted to increase the clearance of aminophylline. Adjust dose. (Moderate) Theoretical

▶ Beta blockers, non-selective are predicted to increase the risk of bronchospasms when given with aminophylline. Avoid. (Serious) Theoretical

▶ Beta blockers, selective are predicted to increase the risk of bronchospasms when given with aminophylline. Avoid. (Serious) Theoretical

▶ Combined hormonal contraceptives are predicted to increase the exposure to aminophylline. Adjust dose. (Moderate) Theoretical

▶ Aminophylline increases the risk of agitation when given with doxapram. (Moderate) Study

▶ H₂ receptor antagonists (cimetidine) increase the concentration of aminophylline. Adjust dose. (Serious) Study

▶ HIV-protease inhibitors (ritonavir) increase the exposure to aminophylline. Adjust dose. (Serious) Study

▶ Interferons are predicted to slightly increase the exposure to aminophylline. Adjust dose. (Moderate) Theoretical

▶ Iron chelators (deferasirox) are predicted to increase the exposure to aminophylline. Avoid. (Moderate) Theoretical

▶ Isoniazid is predicted to affect the clearance of aminophylline. (Serious) Theoretical

▶ Aminophylline is predicted to decrease the concentration of lithium. (Moderate) Theoretical

▶ Macrolides (azithromycin) are predicted to increase the exposure to aminophylline. (Moderate) Theoretical

▶ Macrolides (clarithromycin) are predicted to increase the exposure to aminophylline. Adjust aminophylline dose. (Moderate) Theoretical

▶ Aminophylline is predicted to decrease the exposure to macrolides (erythromycin). Adjust dose. (Severe) Study

▶ Methotrexate is predicted to decrease the clearance of aminophylline. (Moderate) Theoretical

▶ Monoclonal antibodies (blinatumomab) are predicted to transiently increase the exposure to aminophylline. Monitor and adjust dose. (Moderate) Theoretical

▶ Pentoxifylline is predicted to increase the concentration of aminophylline. Use with caution or avoid. (Serious) Theoretical

▶ Quinolones (ciprofloxacin, norfloxacin) are predicted to increase the exposure to aminophylline. Adjust dose. (Moderate) Theoretical

▶ Rifampicin decreases the exposure to aminophylline. Adjust dose. (Moderate) Study

▶ Aminophylline is predicted to slightly increase the exposure to roflumilast. Avoid. (Moderate) Theoretical

▶ SSRIs (fluvoxamine) moderately to markedly increase the exposure to aminophylline. Avoid. (Serious) Study

▶ St John’s Wort is predicted to decrease the concentration of aminophylline. (Severe) Theoretical

▶ Sympathomimetics, vasoconstrictor (ephedrine) increase the risk of side-effects when given with aminophylline. Avoid in children. (Moderate) Study

▶ Valaciclovir is predicted to increase the exposure to aminophylline. (Serious) Anecdotal

Aminosalicylic acid

▶ Aminosalicylic acid is predicted to increase the risk of methaemoglobinemia when given with topical anesthetics, local (prilocaine). Use with caution or avoid. (Serious) Theoretical

▶ Aminosalicylic acid is predicted to increase the risk of methaemoglobinemia when given with dapsone. (Serious) Theoretical

Amisulpride → see QT-interval prolongation, TABLE 9 p. 820

▶ Amisulpride is predicted to decrease the effects of dopamine receptor agonists. Avoid. (Serious) Theoretical → Also see TABLE 9 p. 820

▶ Amisulpride is predicted to decrease the effects of levodopa. Avoid. (Serious) Theoretical

Amirtipryline → see tricyclic antidepressants

Amlodipine → see calcium channel blockers

Amoxicillin → see penicillins

Amphotericin → see TABLE 2 p. 818 (nephrotoxicity), TABLE 17 p. 822 (reduced serum potassium)

▶ Amphotericin increases the risk of toxicity when given with flucytosine. (Serious) Study

▶ Mefloquine slightly increases the exposure to amphotericin. Avoid or monitor toxicity. (Moderate) Study

▶ Sodium stibogluconate increases the risk of cardiovascular side-effects when given with amphotericin. Separate administration by 14 days. (Serious) Study

Ampicillin → see penicillins

Amsacrine → see TABLE 15 p. 821 (myelosuppression)

▶ Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with amsacrine. Public Health England advises avoid. (Serious) Theoretical

Anaesthetics, local → see TABLE 11 p. 820 (CNS depressant effects)

bupivacaine - levobupivacaine - mevipacaine - oxybuprocaine - procarbazine - propacetamol - ropivacaine - tetracaine

▶ Aminosalicylic acid is predicted to increase the risk of methaemoglobinemia when given with topical prilocaine. Use with caution or avoid. (Serious) Theoretical

▶ Anaesthetics, local are predicted to increase the risk of cardiovascular side-effects when given with prilocaine. Separate administration by 14 days. (Serious) Study

▶ Anamaline (chloroquine, primaquine) are predicted to increase the risk of methaemoglobinemia when given with topical prilocaine. Use with caution or avoid. (Serious) Theoretical

▶ Dapsone is predicted to increase the risk of methaemoglobinemia when given with topical prilocaine. Avoid prolonged use. (Serious) Study

▶ Metoclopramide is predicted to increase the risk of methaemoglobinemia when given with topical prilocaine. Avoid. (Serious) Theoretical

▶ Nitrites are predicted to increase the risk of methaemoglobinemia when given with topical prilocaine. Avoid. (Serious) Theoretical

▶ Nitrofurantoin is predicted to increase the risk of methaemoglobinemia when given with topical prilocaine. Avoid. (Serious) Theoretical

▶ Paracetamol is predicted to increase the risk of methaemoglobinemia when given with topical prilocaine. Use with caution or avoid. (Serious) Theoretical

▶ Sodium nitroprusside is predicted to increase the risk of methaemoglobinemia when given with topical prilocaine. Use with caution or avoid. (Serious) Theoretical

▶ SSRIs (fluvoxamine) decrease the clearance of ropivacaine. Avoid prolonged use. (Serious) Study

▶ Sulfonamides potentially increase the risk of methaemoglobinemia when given with topical prilocaine. Use with caution or avoid. (Serious) Theoretical

Anagrelide → see TABLE 4 p. 818 (antiplatelet effects)

▶ Combined hormonal contraceptives are predicted to increase the exposure to anagrelide. (Moderate) Theoretical

▶ Quinolones (ciprofloxacin) are predicted to increase the exposure to anagrelide. (Moderate) Theoretical

▶ SSRIs (fluvoxamine) are predicted to increase the exposure to anagrelide. (Moderate) Theoretical → Also see TABLE 4 p. 818

Anakinra → see TABLE 15 p. 821 (myelosuppression)

▶ Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with...
Antacids

aluminium hydroxide • magnesium carbonate • magnesium trisilicate

**SEPARATION OF ADMINISTRATION** Antacids should preferably not be taken at the same time as other drugs since they might impair absorption. Antacids might damage enteric coatings designed to prevent dissolution in the stomach.

- Antacids are predicted to decrease the absorption of alkylating agents (*estramustine*). Avoid. [Moderate] Study
- Antacids decrease the absorption of antiepileptics (*gabapentin*). *Gabapentin* should be taken 2 hours after antacids. [Moderate] Study
- Antacids decrease the absorption of antifungals, azoles (*itraconazole*). Antacids should be taken 1 hour before or 2 hours after *itraconazole*. [Moderate] Study
- Antacids decrease the absorption of antifungals, azoles (*ketocnazole*). Separate administration by at least 2 hours. [Moderate] Study
- Antacids are predicted to decrease the absorption of antimarial drugs (*chloroquine*). Separate administration by at least 4 hours. [Mild] Study
- Antacids are predicted to decrease the absorption of antimalarials (*proguanil*). Separate administration by at least 2 hours. [Moderate] Study
- Antacids decrease the absorption of aspirin (high-dose). [Moderate] Study
- Antacids decrease the absorption of bisphosphonates (*alendronic acid*). Alendronic acid should be taken at least 30 minutes before antacids. [Moderate] Study
- Antacids are predicted to decrease the absorption of bisphosphonates (*ibandronic acid*). Avoid antacids for at least 6 hours before or 1 hour after *ibandronic acid*. [Moderate] Study
- Antacids decrease the absorption of bisphosphonates (*sodium clodronate*). Avoid antacids for 2 hours before or 1 hour after *sodium clodronate*. [Moderate] Study
- Antacids are predicted to decrease the absorption of bosutinib. *Bosutinib* should be taken at least 12 hours before antacids. [Moderate] Theoretical
- Antacids are predicted to decrease the absorption of ceritinib. Separate administration by 2 hours. [Moderate] Theoretical
- Antacids are predicted to decrease the absorption of ceritinib. Separate administration by 2 hours. [Moderate] Theoretical
- Antacids are predicted to decrease the absorption of *cholecalciferol*. Separate administration by 5 hours. [Mild] Theoretical
- Antacids are predicted to decrease the absorption of *cholecalciferol*. Separate administration by 2 hours. [Moderate] Theoretical
- Antacids decrease the absorption of corticosteroids (*deflazacort*). Separate administration by 2 hours. [Moderate] Theoretical
- Antacids are predicted to decrease the absorption of dabrafenib. Avoid. [Severe] Theoretical
- Antacids decrease the absorption of dasatinib. Separate administration by at least 2 hours. [Moderate] Study
- Antacids decrease the absorption of deflazacort. Separate administration by 2 hours. [Mild] Theoretical
- Antacids decrease the absorption of *digoxin*. Separate administration by 2 hours. [Mild] Study
- Antacids are predicted to decrease the absorption of dipiridamole (immediate release tablets). [Moderate] Theoretical
- Antacids moderately decrease the absorption of *dolutegravir*. Dolutegravir should be taken 2 hours before or 6 hours after antacids. [Moderate] Study
- Antacids decrease the absorption of *elotristib*. Elotristib should be taken 2 hours before or 4 hours after antacids. [Severe] Study
- Antacids moderately decrease the exposure to *elvitegravir*. Separate administration by at least 4 hours. [Moderate] Study
- Aluminium hydroxide is predicted to decrease the absorption of deferiprone. Avoid. [Moderate] Theoretical
- Antacids decrease the absorption of *digoxin*. Separate administration by 2 hours. [Mild] Study
- Antacids are predicted to decrease the absorption of dipiridamole (immediate release tablets). [Moderate] Theoretical
- Antacids moderately decrease the exposure to *dolutegravir*. Dolutegravir should be taken 2 hours before or 6 hours after antacids. [Moderate] Study
- Antacids decrease the absorption of *elotristib*. Elotristib should be taken 2 hours before or 4 hours after antacids. [Severe] Study
- Antacids are predicted to decrease the absorption of *erlotinib*. *Erlotinib* should be taken 4 hours before or 2 hours after erlotinib. [Moderate] Theoretical
- Antacids slightly to moderately decrease the exposure to *fibrate* (*gemfibrozil*). [Moderate] Study
- Antacids are predicted to slightly decrease the exposure to *gefitinib*. [Moderate] Theoretical
- Antacids are predicted to decrease the absorption of *HIV-protease inhibitors* (*atazanavir*). Azaatinavir should be taken 2 hours before or 1 hour after antacids. [Severe] Theoretical
- Antacids are predicted to decrease the absorption of *HIV-protease inhibitors* (*tipranavir*). Separate administration by 2 hours. [Moderate] Study
- Antacids decrease the absorption of *hydroxyzine* (*chlorhydrate*). Separate administration by at least 4 hours. [Moderate] Study
- Antacids decrease the absorption of *iron* (*oral*). *Iron* (*oral*) should be taken 1 hour before or 2 hours after antacids. [Moderate] Study
- Antacids decrease the absorption of *iron* (*oral*). Separate administration by 4 hours. [Moderate] Theoretical
- Antacids are predicted to decrease the absorption of *lapatinib*. Avoid. [Moderate] Theoretical
- Antacids are predicted to decrease the absorption to *ledipasvir*. Separate administration by 4 hours. [Moderate] Theoretical
- Antacids are predicted to decrease the absorption of *levonorgestrel*. Separate administration by at least 4 hours. [Moderate] Study
- Antacids decrease the exposure to *mycophenolate*. [Moderate] Study
- Antacids are predicted to decrease the absorption of *nilotinib*. Separate administration by at least 2 hours. [Moderate] Theoretical
- Magnesium trisilicate decreases the absorption of *nitrofurantoin*. [Moderate] Study
- Antacids are predicted to decrease the absorption of * pazopanib*. Pazopanib should be taken 1 hour before or 2 hours after antacids. [Moderate] Theoretical
- Antacids decrease the absorption of *penicillamine*. Separate administration by 2 hours. [Mild] Study
- Antacids decrease the absorption of *phenotiazines*. [Moderate] Anecdotal
- Antacids increase the risk of metabolic alkalosis when given with *polystyrene sulfonate*. [Severe] Anecdotal
- Antacids decrease the absorption of *quinolones*. Quinolones should be taken 2 hours before or 4 hours after antacids. [Moderate] Study
- Antacids slightly decrease the exposure to *raltegravir*. Avoid. [Moderate] Study
- Antacids decrease the absorption of *rifampicin*. Rifampicin should be taken 1 hour before antacids. [Moderate] Study
- Antacids are predicted to decrease the exposure to *rilpivirine*. *Rilpivirine* should be taken 2 hours before or 4 hours after rilpivirine. [Theoretical]
- Antacids slightly decrease the exposure to *riociguat*. [Mild] Study
- Antacids should be taken 2 hours before or 1 hour after *riociguat*. [Mild] Study
Antacids — Antiarrhythmics 829

- **Antacids** moderately decrease the absorption of **statins** (rosuvastatin). Separate administration by 2 hours. [Moderate] Study
- **Antacids** decrease the absorption of **strontium ranelate**. Separate administration by 2 hours. [Moderate] Study
- **Antacids** decrease the absorption of **tetracyclines**. Separate administration by 2 to 3 hours. [Moderate] Study
- **Antacids** are predicted to decrease the absorption of **urosodeoxycholic acid**. Separate administration by 2 hours. [Moderate] Theoretical
- **Antacids** are predicted to decrease the concentration of **velpatasvir**. Separate administration by 4 hours. [Moderate] Theoretical

**Anthracyclines** → see TABLE 15 p. 821 (myelosuppression), TABLE 5 p. 618 (thromboembolism)
- daunorubicin • doxorubicin • epirubicin • idarubicin • mitoxantrone • p Successful use of cardiotonic drugs, or drugs that reduce cardiac contractility.

- **Calcium channel blockers** (verapamil) moderately increase the exposure to doxorubicin. [Moderate] Study
- **Ciclosporin** increases the concentration of anthracyclines (daunorubicin, doxorubicin, epirubicin, idarubicin, mitoxantrone). [Severe] Study
- H₂ receptor antagonists (cimetidine) slightly increase the exposure to epirubicin. Avoid. [Moderate] Study
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with anthracyclines. Public Health England advises avoid. [Severe] Theoretical
- **Anthracyclines** are predicted to increase the risk of cardiotoxicity when given with monoclonal antibodies (trastuzumab, trastuzumab emtansine). Avoid. [Severe] Theoretical
- **Antacids** should be avoided when taken with **angiotensin-converting enzyme inhibitors** (ACEi), **angiotensin receptor blockers** (ARBs) or **beta blockers**. [Severe] Theoretical
- **Amiodarone** is a long half-life; there is potential for drug interactions to occur for several weeks (or even months) after treatment with it has been stopped. Since systemic absorption can follow topical application of lidocaine the possibility of interactions should be borne in mind.

- **Abiraterone** is predicted to increase the exposure to flucanazole. [Severe] Theoretical
- **Antiarrhythmics** (amiodarone, dronedarone) are predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [Moderate] Study
- **Amiodarone** is predicted to decrease the effects of **agalsidase**. Avoid. [Moderate] Theoretical
- **Amiodarone** is predicted to increase the exposure to **aldosterone antagonists** (eplerenone). Adjust eplerenone dose. [Severe] Theoretical
- **Dronedarone** is predicted to increase the exposure to **aldosterone antagonists** (eplerenone). Adjust eplerenone dose. [Severe] Study
- **Antiarrhythmics** (amiodarone, dronedarone) are predicted to increase the exposure to **aliskiren**. [Severe] Study
- **Dronedarone** is predicted to increase the exposure to alpha blockers (tamsulosin). [Moderate] Theoretical
- **Dronedarone** is predicted to increase the exposure to alprazolam. [Severe] Study
- **Aminophylline** is predicted to decrease the efficacy of adenosine. Separate administration by 24 hours. [Mild] Theoretical
- **Anaesthetics, local** are predicted to increase the risk of cardiodepression when given with antiarrhythmics. [Severe] Theoretical → Also see TABLE 11 p. 820
- **Antiarrhythmics** (propafenone) are predicted to increase the risk of cardiodepression when given with antiarrhythmics (amiodarone). Monitor and adjust dose. [Severe] Theoretical
- **Antiarrhythmics** (amiodarone) increase the concentration of antiarrhythmics ( flecainide). Adjust flecainide dose and monitor side effects. [Severe] Study → Also see TABLE 6 p. 819 → Also see TABLE 9 p. 820
- **Antiarrhythmics** (propafenone) are predicted to increase the exposure to antiarrhythmics (flecainide). [Severe] Theoretical
- **Antiarrhythmics** (propafenone) are predicted to increase the risk of cardiodepression when given with antiarrhythmics (lidocaine). [Moderate] Study
- **Antiarrhythmics** (dronedarone) are predicted to increase the exposure to antiarrhythmics (propafenone). Monitor and adjust dose. [Moderate] Study
- **Amiodarone** increases the risk of bradycardia when given with anticholinesterases, centrally acting. [Moderate] Anecdotal → Also see TABLE 6 p. 819
- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the efficacy of propafenone. [Moderate] Study
- **Antiepileptics** (fosphenytoin, phenytoin) are predicted to decrease the exposure to lidocaine. [Severe] Anecdotal
- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to antiarrhythmics (disopyramide, dronedarone). Avoid. [Severe] Study
- **Amiodarone** is predicted to slightly increase the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor and adjust dose. [Severe] Study → Also see TABLE 12 p. 821
- **Antifungals, azoles** (flucanazole) are predicted to increase the exposure to disopyramide. [Severe] Theoretical
- **Antifungals, azoles** (flucanazole, isavuconazole, posaconazole) are predicted to increase the exposure to propafenone. Monitor and adjust dose. [Moderate] Study
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to disopyramide. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 820
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) very markedly increase the exposure to dronedarone. Avoid. [Severe] Study → Also see TABLE 9 p. 820
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to propafenone. Monitor and adjust dose. [Severe] Study
- **Antifungals, azoles** (miconazole) are predicted to increase the exposure to disopyramide. Use with caution and adjust dose. [Severe] Theoretical
- **Antifungals, azoles** (posaconazole) are predicted to increase the exposure to antiarrhythmics (disopyramide, dronedarone). Avoid. [Severe] Theoretical
- **Dronedarone** is predicted to increase the exposure to antifungals, azoles (isavuconazole). [Severe] Theoretical
- **Dronedarone** is predicted to increase the exposure to antihistamines, non-sedating (fexofenadine, mizolastine). [Severe] Theoretical
- **Dronedarone** is predicted to increase the concentration of antimalarials (piperquine). [Severe] Theoretical
- **Dronedarone** is predicted to increase the exposure to apixaban. [Mild] Theoretical
- **Aprepitant** increases the exposure to dronedarone. [Severe] Theoretical
- **Aprepitant** is predicted to increase the exposure to propafenone. Monitor and adjust dose. [Moderate] Study
- **Dronedarone** is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical → Also see TABLE 9 p. 820
- **Antiarrhythmics** (amiodarone, disopyramide, dronedarone, flecainide, lidocaine) are predicted to increase the risk of cardiovascular side-effects when given with beta blockers, non-selective. Use with caution or avoid. [Severe] Study → Also see TABLE 6 p. 819 → Also see TABLE 9 p. 820
- **Propafenone** is predicted to increase the risk of cardiovascular
Antiarrhythmics (continued) side-effects when given with beta blockers, non-selective (carazolol, labetalol, levobunolol, nadolol, oxprenolol, pindolol, sotalol). Use with caution or avoid. [Severe Study

- Propafenone is predicted to increase the exposure to beta blockers, non-selective (timolol) and beta blockers, non-selective (timolol) are predicted to increase the risk of cardiovascular side-effect when given with propafenone. [Severe Study

- Propafenone increases the risk of cardiovascular side-effects when given with beta blockers, non-selective (propranolol). Use with caution or avoid. [Severe Study

- Propafenone is predicted to increase the exposure to beta blockers, non-selective (timolol) and beta blockers, non-selective (timolol) are predicted to increase the risk of cardiovascular side-effect when given with propafenone. [Severe Study

- Propafenone increases the concentration of ciclosporin. Monitor ciclosporin concentration and adjust dose. [Severe Study

- Dronedarone increases the concentration of ciclosporin. [Severe Study

- Ciclosporin increases the exposure to dronedarone. Avoid. [Severe Study

- Cinacalcet is predicted to increase the exposure to ciclosporin. [Severe Study

- Cinacalcet is predicted to increase the exposure to propafenone. Monitor and adjust dose. [Moderate Study

- Cobicistat very markedly increases the exposure to dronedarone. Avoid. [Severe Study

- Cobicistat is predicted to increase the exposure to propafenone. Monitor and adjust dose. [Severe Study

- Dronedarone is predicted to increase the exposure to cobimetinib. [Severe Study

- Dronedarone is predicted to increase the exposure to colchicine. Adjust colchicine dose. [Severe Study

- Dronedarone is predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. [Moderate Study

- Amiodarone increases the anticoagulant effect of coumarins. [Severe Study

- Propafenone increases the anticoagulant effect of coumarins. Monitor INR and adjust dose. [Moderate Study

- Dronedarone is predicted to increase the exposure to crizotinib. [Moderate Theoretical

- Dronedarone increases the exposure to dabigatran. Adjust dabigatran dose. [Moderate Study

- Dronedarone slightly increases the exposure to dabigatran. Avoid. [Severe Study

- Daclatasvir is predicted to increase the risk of severe bradycardia or heart block when given with amiodarone. Refer to specialist literature. [Severe Aneodotal

- Dronedarone is predicted to slightly increase the exposure to darifenacin. [Moderate Study

- Darifenacin is predicted to increase the concentration of flecainide. [Moderate Theoretical

- Dronedarone is predicted to increase the exposure to dasatinib. [Severe Study

- Antiarrhythmics (amiodarone, dronedarone) are predicted to moderately increase the exposure to digoxin. Monitor and adjust digoxin dose, p. 79. [Severe Study

- Propafenone increases the concentration of digoxin. Monitor and adjust dose. [Severe Study

- Dipyridamole increases the exposure to adenosine. Avoid or adjust dose. [Severe Study

- Dronedarone increases the risk of QT-prolongation when given with domperidone. Avoid. [Severe Study

- Dronedarone is predicted to increase the exposure to dopamine receptor agonists (bromocriptine, cabergoline). [Severe Theoretical

- Dolutexine is predicted to increase the exposure to flecainide. [Severe Theoretical

- Dronedarone is predicted to moderately increase the exposure to dutasteride. [Mild Study

- Amiodarone slightly increases the exposure to edoxaban. [Severe Study

- Dronedarone slightly increases the exposure to edoxaban. Adjust edoxaban dose. [Severe Study

- Efavirenz is predicted to decrease the exposure to dronedarone. [Severe Theoretical

- Enalaprilamidase is predicted to decrease the exposure to antiarrhythmics (disopyramide, dronedarone). Avoid. [Severe Study

- Enalaprilamidase is predicted to decrease the efficacy of propafenone. [Moderate Study

- Dronedarone is predicted to increase the risk of ergotism when given with ergometrine. [Severe Theoretical

- Dronedarone is predicted to increase the risk of ergotism when given with ergotamine. [Severe Theoretical

- Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to erlotinib. [Moderate Theoretical

- Dronedarone is predicted to increase the concentration of everolimus. Avoid or adjust dose. [Moderate Study

- Dronedarone is predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose in hepatic and renal impairment. [Mild Study

- Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to fidaxomicin. Avoid. [Moderate Study
Grapefruit juice increases the exposure to amiodarone. Avoid. (Moderate) Study

Grapefruit juice moderately increases the exposure to ranolazine. Avoid. (Severe) Study

Grapefruit juice increases the exposure to propafenone. Monitor and adjust dose. (Moderate) Study

Dronedarone is predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 222. (Moderate) Theoretical

H₂ receptor antagonists (cimetidine) increase the exposure to amiodarone. (Moderate) Study

H₂ receptor antagonists (cimetidine) slightly increase the exposure to flecainide. Monitor and adjust dose. (Severe) Study

H₂ receptor antagonists (cimetidine) increase the exposure to lidocaine. Monitor and adjust dose. (Moderate) Study

H₂ receptor antagonists (cimetidine) are predicted to increase the exposure to propafenone. Monitor and adjust dose. (Moderate) Study

HIV-protease inhibitors are predicted to increase the exposure to amiodarone. Avoid. (Severe) Theoretical → Also see TABLE 9 p. 820

HIV-protease inhibitors are predicted to increase the exposure to disopyramide. (Severe) Theoretical → Also see TABLE 9 p. 820

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to propafenone. Monitor and adjust dose. (Severe) Study

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) very markedly increase the exposure to dronedarone. Avoid. (Severe) Study → Also see TABLE 9 p. 820

HIV-protease inhibitors are predicted to increase the exposure to lidocaine. Avoid. (Severe) Study

HIV-protease inhibitors are predicted to increase the exposure to flecainide. Avoid or adjust ibrutinib dose. (Severe) Theoretical

Idelalisib very markedly increases the exposure to dronedarone. Avoid. (Severe) Study

Idelalisib is predicted to increase the exposure to propafenone. Monitor and adjust dose. (Moderate) Study

Idelalisib is predicted to increase the exposure to flecainide. (Severe) Theoretical

Dronedarone is predicted to increase the exposure to ibritinib. Avoid or adjust ibritinib dose. (Severe) Theoretical

Dronedarone is predicted to increase the exposure to lopinavir. Adjust lopinavir dose, p. 177. (Moderate) Study

Dronedarone is predicted to increase the exposure to lapatinib. (Moderate) Study → Also see TABLE 9 p. 820

Ledipasvir increases the risk of severe bradycardia or heart block when given with amiodarone. Refer to specialist literature. (Severe) Anecdotal

Amiodarone increases the risk of thyroid dysfunction when given with levothyroxine. Avoid. (Moderate) Study

Amiodarone is predicted to increase the risk of thyroid dysfunction when given with lithium. Avoid. (Moderate) Theoretical

Amiodarone is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

Dronedarone is predicted to increase the exposure to lomitapide. Avoid. (Moderate) Theoretical

Dronedarone is predicted to increase the exposure to loperamide. (Severe) Theoretical

Dronedarone is predicted to increase the exposure to lurasidone. (Moderate) Study

Macrolides (clarithromycin) very markedly increase the exposure to dronedarone. Avoid. (Severe) Study → Also see TABLE 9 p. 820

Macrolides (clarithromycin) are predicted to increase the exposure to propafenone. Monitor and adjust dose. (Severe) Study

Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to lidocaine. (Moderate) Theoretical

Macrolides (erythromycin) are predicted to moderately increase the exposure to dronedarone. Avoid. (Severe) Theoretical

Macrolides (erythromycin) are predicted to increase the exposure to propafenone. Monitor and adjust dose. (Moderate) Study

Dronedarone is predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. (Moderate) Study

Mirabegron is predicted to increase the exposure to flecainide. (Severe) Theoretical

Dronedarone increases the risk of neutropenia when given with monoclonal antibodies (brentuximab vedotin). Monitor and adjust dose. (Severe) Theoretical

Dronedarone is predicted to increase the exposure to naloxegol. Adjust naloxegol dose and monitor side effects. (Moderate) Study

Netupitant is predicted to increase the exposure to propafenone. Monitor and adjust dose. (Moderate) Study

Nevirapine is predicted to decrease the exposure to dronedarone. (Severe) Theoretical

Dronedarone is predicted to increase the exposure to nilotinib. (Moderate) Theoretical → Also see TABLE 9 p. 820

Nilotinib is predicted to increase the exposure to propafenone. Monitor and adjust dose. (Moderate) Study

Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to nintedanib. (Moderate) Study

NSAIDs, (celecoxib) are predicted to increase the exposure to antiarrhythmics (flecainide, propafenone). Monitor and adjust dose. (Moderate) Theoretical

Dronedarone is predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose. (Moderate) Theoretical

Dronedarone is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. (Moderate) Study

Amiodarone is predicted to increase the concentration of opioids (fentanyl). (Moderate) Theoretical → Also see TABLE 6 p. 819

Dronedarone is predicted to increase the exposure to opioids (methadone, sufentanil). (Moderate) Theoretical → Also see TABLE 9 p. 820

Propafenone is predicted to decrease the efficacy of opioids (tramadol). (Moderate) Study

Dronedarone is predicted to increase the exposure to oxybutynin. (Mild) Theoretical

Dronedarone is predicted to increase the exposure to pazopanib. (Moderate) Theoretical → Also see TABLE 9 p. 820

Propafenone is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil). Adjust avanafil dose. (Moderate) Theoretical

Dronedarone is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Monitor and adjust sildenafil dose, p. 117. (Moderate) Study → Also see TABLE 9 p. 820

Dronedarone is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). (Severe) Theoretical

Dronedarone is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (vardenafil). Adjust dose. (Severe) Theoretical → Also see TABLE 9 p. 820

Dronedarone is predicted to increase the exposure to pimozide. Avoid. (Severe) Theoretical → Also see TABLE 9 p. 820

Propafenone is predicted to increase the exposure to piritrins. Use with caution and adjust dose. (Moderate) Study

Dronedarone is predicted to increase the exposure to quetiapine. Avoid. (Moderate) Study

Quinolones (ciprofloxacin) slightly increase the exposure to lidocaine. (Mild) Study

Dronedarone is predicted to increase the exposure to ranolazine. (Severe) Study → Also see TABLE 9 p. 820

Amiodarone is predicted to increase the exposure to retinoids (allitretinoin). Adjust allitretinoin dose. (Moderate) Theoretical

Also see TABLE 9 p. 820

A1
Antiarrhythmics (continued)

- **Rifampicin** is predicted to decrease the exposure to antiarrhythmics (disopyramide, dronedarone). Avoid. [Severe] Study
- **Rifampicin** is predicted to decrease the efficacy of propafenone. [Moderate] Study
- **Dronedarone** is predicted to increase the exposure to rifaximin. Avoid. [Moderate] Theoretical
- **Dronedarone** is predicted to increase the exposure to ruxolitinib. [Moderate] Theoretical
- **Dronedarone** is predicted to increase the exposure to saxagliptin. [Mild] Study
- **Simprevir** is predicted to increase the concentration of amiodarone. Refer to specialist literature. [Severe] Anecdotal
- **Dronedarone** is predicted to increase the exposure to simprevir. Avoid. [Mild] Study
- **Amiodarone** is predicted to increase the concentration of sirolimus. [Severe] Anecdotal
- **Dronedarone** increases the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study
- **Sofosbuvir** is predicted to increase the risk of severe bradycardia or heart block when given with amiodarone. Refer to specialist literature. [Severe] Anecdotal
- **SSRIs** (fluoxetine, fluvoxamine, paroxetine) are predicted to increase the risk of rhabdomyolysis when given with statins (atorvastatin). Monitor and adjust dose. [Moderate] Study
- **SSRIs** (fluoxetine, paroxetine) are predicted to increase the exposure to flecainide. [Severe] Theoretical
- **Dronedarone** is predicted to increase the exposure to SSRIs (citalopram, escitalopram, fluoxetine, fluvoxamine, paroxetine, sertraline). [Severe] Theoretical → Also see TABLE 9 p. 820
- **Dronedarone** is predicted to increase the exposure to SSRIs (dopoxetine). Adjust dopoxetine dose. [Moderate] Theoretical
- **St John’s Wort** is predicted to decrease the exposure to dronedarone. Avoid. [Severe] Theoretical
- **Amiodarone** is predicted to increase the risk of rhabdomyolysis when given with statins (atorvastatin). Monitor and adjust dose. [Moderate] Theoretical
- **Dronedarone** is predicted to increase the exposure to statins (atorvastatin). Monitor and adjust dose. [Severe] Theoretical
- **Amiodarone** is predicted to increase the exposure to statins (fluvastatin). [Severe] Theoretical
- **Dronedarone** slightly increases the exposure to statins (rosuvastatin). Adjust dose. [Severe] Study
- **Amiodarone** increases the risk of rhabdomyolysis when given with statins (simvastatin). Adjust simvastatin dose, p. 130. [Severe] Study
- **Dronedarone** is predicted to increase the exposure to statins (simvastatin). Use with caution and adjust simvastatin dose, p. 130. [Severe] Study
- **Amiodarone** is predicted to increase the exposure to sulfonylureas. Use with caution and adjust dose. [Moderate] Study
- **Dronedarone** is predicted to increase the exposure to sunifelbin. [Moderate] Theoretical → Also see TABLE 9 p. 820
- **Lidocaine** is predicted to increase the effects of suxamethonium. [Moderate] Study
- **Amiodarone** is predicted to increase the concentration of tacrolimus. [Severe] Anecdotal
- **Dronedarone** is predicted to increase the concentration of tacrolimus. [Severe] Study
- **Dronedarone** is predicted to increase the exposure to taxanes (cabazitaxel). [Moderate] Theoretical
- **Dronedarone** is predicted to increase the exposure to taxanes (paclitaxel). [Severe] Theoretical
- **Dronedarone** is predicted to increase the concentration of temsirolimus. [Moderate] Theoretical
- **Terbinafine** is predicted to increase the exposure to flecainide. [Severe] Theoretical
- **Terbinafine** is predicted to increase the exposure to propafenone. Monitor and adjust dose. [Moderate] Study
- **Theophylline** decreases the efficacy of adenosine. Separate administration by 24 hours. [Mild] Study
- **Amiodarone** is predicted to increase the exposure to ticagrelor. Use with caution or avoid. [Severe] Study
- **Dronedarone** is predicted to increase the exposure to tolvudine. [Mild] Theoretical → Also see TABLE 9 p. 820
- **Dronedarone** is predicted to increase the exposure to tolvaptan. Adjust dose. [Moderate] Theoretical
- **Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to Topotecan. [Severe] Study
- **Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the concentration of trametinib. [Moderate] Theoretical
- **Dronedarone** is predicted to increase the exposure to trazodone. [Moderate] Theoretical
- **Dronedarone** is predicted to increase the risk of torsade de points when given with tricyclic antidepressants. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 820
- **Propafenone** is predicted to increase the concentration of tricyclic antidepressants. [Moderate] Theoretical → Also see TABLE 10 p. 820
- **Dronedarone** is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Moderate] Study
- **Amiodarone** is predicted to increase the concentration of velpatasvir. Avoid or monitor. [Moderate] Theoretical
- **Amiodarone** is predicted to increase the exposure to venetoclax. Avoid or monitor for toxicity. [Severe] Theoretical
- **Dronedarone** is predicted to increase the exposure to venetoclax. Avoid or adjust venetoclax dose. [Severe] Study
- **Dronedarone** is predicted to increase the exposure to vinca alkaloids. [Severe] Theoretical → Also see TABLE 9 p. 820
- **Dronedarone** is predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Study

**Anticholinesterases, centrally acting** → See TABLE 6 p. 819

(bradycardia)

- **Donepezil** - galantamine - rivastigmine

- **Antiarrhythmics (amiodarone)** increase the risk of bradycardia when given with anticholinesterases, centrally acting. [Moderate] Anecdotal → Also see TABLE 6 p. 819
- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to donepezil. [Mild] Study
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to galantamine. Monitor and adjust dose. [Moderate] Study
- **Anticholinesterases, centrally acting** are predicted to increase the risk of bradycardia when given with beta blockers, non-selective. [Moderate] Anecdotal → Also see TABLE 6 p. 819
- **Anticholinesterases, centrally acting** are predicted to increase the risk of bradycardia when given with beta blockers, selective. [Moderate] Anecdotal → Also see TABLE 6 p. 819
- **Bupropion** is predicted to increase the exposure to donepezil. [Moderate] Theoretical
- **Bupropion** is predicted to increase the exposure to galantamine. Monitor and adjust dose. [Moderate] Study
- **Calcium channel blockers (diltiazem, verapamil)** increase the risk of bradycardia when given with anticholinesterases, centrally acting. [Moderate] Anecdotal → Also see TABLE 6 p. 819
- **Cinacalcet** is predicted to increase the exposure to donepezil. [Moderate] Theoretical
- **Cinacalcet** is predicted to increase the exposure to galantamine. Monitor and adjust dose. [Moderate] Study
- **Cobicistat** is predicted to increase the exposure to galantamine. Monitor and adjust dose. [Moderate] Study
- **Enzalutamide** is predicted to decrease the exposure to donepezil. [Mild] Study
- **HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to increase the exposure to galantamine. Monitor and adjust dose. [Moderate] Study
- **Idelalisib** is predicted to increase the exposure to galantamine. Monitor and adjust dose. [Moderate] Study
- **Macrolides (clarithromycin)** are predicted to increase the exposure to galantamine. Monitor and adjust dose. [Moderate] Study
- **Anticholinesterases, centrally acting** are predicted to decrease the effects of neuromuscular blocking drugs, non-depolarising. [Moderate] Theoretical → Also see TABLE 6 p. 819
- **Rifampicin** is predicted to decrease the exposure to donepezil. [Mild] Study
Anticholinesterases, centrally acting — Antiepileptics 833

SSRIs (fluoxetine, paroxetine) are predicted to increase the
exposure to donepezil. o Theoretical
▶ SSRIs (fluoxetine, paroxetine) are predicted to increase the
exposure to galantamine. Monitor and adjust dose. o

▶

▶

▶

Study
▶
▶

Anticholinesterases, centrally acting increase the effects of
suxamethonium. o Theoretical
Terbinafine is predicted to increase the exposure to donepezil.

▶

o Theoretical

▶

Terbinafine is predicted to increase the exposure to
galantamine. Monitor and adjust dose. o Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital,
phenytoin, primidone) are predicted to decrease the exposure
to abacavir. o Theoretical
Antiepileptics (carbamazepine, fosphenytoin, phenobarbital,
phenytoin, primidone) are predicted to decrease the exposure
to abiraterone. Avoid. r Theoretical
Acetazolamide potentially increases the risk of overheating
and dehydration when given with zonisamide. Avoid in
children. r Theoretical
Carbamazepine is predicted to decrease the exposure to
afatinib. o Study
Antiepileptics (fosphenytoin, phenytoin) are predicted to
decrease the exposure to agomelatine. o Theoretical
Antiepileptics (carbamazepine, fosphenytoin, phenobarbital,
phenytoin, primidone) decrease the concentration of
albendazole. o Study
Antiepileptics (carbamazepine, fosphenytoin, phenobarbital,
phenytoin, primidone) are predicted to decrease the exposure
to aldosterone antagonists (eplerenone). Avoid. o
Theoretical → Also see TABLE 18 p. 822
Carbamazepine decreases the exposure to aliskiren. o
Study

▶

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital,
phenytoin, primidone) are predicted to decrease the exposure
to alprazolam. Adjust alprazolam dose. o Theoretical →
Also see TABLE 11 p. 820

▶
▶
▶
▶
▶

▶
▶

Fosphenytoin is predicted to decrease the exposure to
aminophylline. Adjust dose. o Study
Phenobarbital is predicted to decrease the exposure to
aminophylline. Adjust dose. o Theoretical
Phenytoin decreases the exposure to aminophylline. Adjust
dose. o Study
Primidone is predicted to increase the clearance of
aminophylline. Adjust dose. o Theoretical
Antiepileptics (fosphenytoin, phenobarbital, phenytoin,
primidone) are predicted to increase the risk of
methaemoglobinaemia when given with topical anaesthetics,
local (prilocaine). Use with caution or avoid. r
Theoretical → Also see TABLE 11 p. 820
Antacids decrease the absorption of gabapentin. Gabapentin
should be taken 2 hours after antacids. o Study
Antiepileptics (carbamazepine, fosphenytoin, phenobarbital,
phenytoin, primidone) are predicted to decrease the exposure
to antiarrhythmics (disopyramide, dronedarone). Avoid. r
Study

Antiarrhythmics (amiodarone) are predicted to slightly increase
the concentration of antiepileptics (fosphenytoin, phenytoin).
Monitor and adjust dose. r Study → Also see TABLE 12 p. 821
▶ Antiepileptics (fosphenytoin, phenytoin) are predicted to
decrease the exposure to antiarrhythmics (lidocaine). r

▶

Anecdotal

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital,
phenytoin, primidone) are predicted to decrease the efﬁcacy of
antiarrhythmics (propafenone). o Study
Antiepileptics (carbamazepine, fosphenytoin, phenobarbital,
phenytoin, primidone) are predicted to decrease the exposure
to anticholinesterases, centrally acting (donepezil). n Study
Antiepileptics (carbamazepine) decrease the concentration of
antiepileptics (brivaracetam). o Study
Antiepileptics (fosphenytoin, phenytoin) decrease the
concentration of antiepileptics (brivaracetam). o Study
Antiepileptics (lamotrigine) potentially increase the
concentration of antiepileptics (carbamazepine) and
antiepileptics (carbamazepine) decrease the concentration of
antiepileptics (lamotrigine). Adjust lamotrigine dose and
monitor carbamazepine concentration, p. 194. o Study
Antiepileptics (phenobarbital) affect the concentration of
antiepileptics (carbamazepine) and antiepileptics
(carbamazepine) increase the concentration of antiepileptics
(phenobarbital). Adjust dose. o Study
Antiepileptics (stiripentol) increase the concentration of
antiepileptics (carbamazepine). r Study
Antiepileptics (topiramate) increase the risk of carbamazepine
toxicity when given with antiepileptics (carbamazepine).
o Study

Antiepileptics (carbamazepine) slightly decrease the exposure
to antiepileptics (eslicarbazepine, oxcarbazepine). Monitor and
adjust dose. o Study
▶ Antiepileptics (oxcarbazepine) are predicted to increase the
concentration of antiepileptics (fosphenytoin). Monitor
concentration and adjust dose. o Study
▶ Antiepileptics (carbamazepine) affect the concentration of
antiepileptics (fosphenytoin, phenytoin) and antiepileptics
(fosphenytoin, phenytoin) decrease the concentration of
antiepileptics (carbamazepine). Monitor and adjust dose. r

▶

Study
▶

Antiepileptics (eslicarbazepine) increase the exposure to
antiepileptics (fosphenytoin, phenytoin) and antiepileptics
(fosphenytoin, phenytoin) decrease the exposure to
antiepileptics (eslicarbazepine). Monitor and adjust dose.
o Study

▶

Antiepileptics (stiripentol) are predicted to increase the
concentration of antiepileptics (fosphenytoin, phenytoin).
r Study

Antiepileptics (valproate) affect the concentration of
antiepileptics (fosphenytoin, phenytoin) and antiepileptics
(fosphenytoin, phenytoin) decrease the concentration of
antiepileptics (valproate). r Study
▶ Antiepileptics (vigabatrin) decrease the concentration of
antiepileptics (fosphenytoin, phenytoin). n Study
▶ Antiepileptics (fosphenytoin) decrease the concentration of
antiepileptics (lamotrigine). Monitor and adjust lamotrigine
dose, p. 194. o Study
▶ Antiepileptics (phenobarbital, phenytoin, primidone) decrease
the concentration of antiepileptics (lamotrigine). Monitor and
adjust lamotrigine dose, p. 194. o Study → Also see
▶

TABLE 11 p. 820
▶

Antiepileptics (valproate) increase the exposure to antiepileptics
(lamotrigine). Adjust lamotrigine dose and monitor rash, p. 194.
r Study

Antiepileptics (lamotrigine) are predicted to increase the
concentration of antiepileptics (oxcarbazepine) and
antiepileptics (oxcarbazepine) are predicted to decrease the
concentration of antiepileptics (lamotrigine). Monitor side
effects and adjust dose. o Study
▶ Antiepileptics (carbamazepine, fosphenytoin) are predicted to
decrease the exposure to antiepileptics (perampanel). Monitor
and adjust dose. o Study
▶ Antiepileptics (oxcarbazepine) decrease the concentration of
antiepileptics (perampanel) and antiepileptics (perampanel)
increase the concentration of antiepileptics (oxcarbazepine).
Monitor and adjust dose. o Study
▶ Antiepileptics (phenobarbital, phenytoin, primidone) are
predicted to decrease the exposure to antiepileptics
(perampanel). Monitor and adjust dose. o Study → Also

Interactions | Appendix 1

BNFC 2017–2018


Antiepileptics (continued)

- Antiepileptics (phenytoin) increase the concentration of antifungals (phenobarbital) and antiepileptics (phenobarbital) affect the concentration of antiepileptics (phenytoin). [Moderate] Study
- Antiepileptics (fosphenytoin) increase the concentration of antiepileptics (phenobarbital, primidone) and antiepileptics (phenobarbital, primidone) affect the concentration of antiepileptics (fosphenytoin). [Moderate] Study
- Antiepileptics (stripentol) are predicted to increase the concentration of antiepileptics (phenobarbital, primidone). [Severe] Theoretical
- Antiepileptics (oxcarbazepine) are predicted to increase the concentration of antiepileptics (phenytoin). Monitor concentration and adjust dose. [Moderate] Study
- Antiepileptics (carbamazepine) potentially decrease the concentration of antiepileptics (primidone) and antiepileptics (primidone) potentially decrease the concentration of antiepileptics (carbamazepine). Adjust dose. [Moderate] Anecdotal Study
- Antiepileptics (phenytoin) increase the concentration of antiepileptics (primidone) and antiepileptics (primidone) affect the concentration of antiepileptics (phenytoin). [Moderate] Study
- Antiepileptics (valproate) affect the concentration of antiepileptics (primidone). Monitor and adjust dose. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenytoin) decrease the exposure to antiepileptics (retigabine). [Moderate] Study
- Antiepileptics (valproate) increase the exposure to antiepileptics ( Rufinamide). Adjust Rufinamide dose, p. 200. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to antiepileptics (Tiagabine). Monitor and adjust Tiagabine dose, p. 203. [Moderate] Study
- Antiepileptics (fosphenytoin, phenytoin) decrease the concentration of antiepileptics (Topiramate) and antiepileptics (topiramate) increase the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor and adjust dose. [Moderate] Study
- Antiepileptics (phenobarbital, primidone) are predicted to decrease the concentration of antiepileptics (topiramate). [Mild] Study
- Antiepileptics (phenobarbital) decrease the concentration of antiepileptics (valproate) and antiepileptics (valproate) increase the concentration of antiepileptics (phenobarbital). Monitor and adjust dose. [Moderate] Study
- Antiepileptics (topiramate) increase the risk of toxicity when given with antiepileptics (valproate). [Severe] Study
- Antiepileptics (carbamazepine) slightly to moderately decrease the concentration of antiepileptics (zonisamide) and antiepileptics (zonisamide) affect the concentration of antiepileptics (carbamazepine). Monitor and adjust dose. [Moderate] Study
- Antiepileptics (fosphenytoin, phenytoin) slightly to moderately decrease the concentration of antiepileptics (zonisamide). Monitor and adjust dose. [Moderate] Study
- Antiepileptics (phenobarbital, primidone) are predicted to decrease the concentration of antiepileptics (zonisamide). Monitor and adjust dose. [Moderate] Study
- Antiepileptics (topiramate) potentially increase the risk of overheating and dehydration when given with antiepileptics (zonisamide). Avoid in children. [Severe] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to slightly increase the exposure to perampanel. [Mild] Study
- Antifungals, azoles (itraconazole) increase the risk of carbamazepine toxicity when given with carbamazepine. Monitor and adjust dose. [Severe] Anecdotal
- Antifungals, azoles (miconazole) increase the risk of phenytoin toxicity when given with fosphenytoin. Monitor and adjust dose. [Severe] Anecdotal
- Antifungals, azoles (miconazole) increase the risk of phenytoin toxicity when given with phenytoin. Monitor and adjust dose. [Severe] Anecdotal
- Carbamazepine is predicted to decrease the efficacy of antifungals, azoles (fluconazole) and antifungals, azoles (itraconazole) increase the concentration of carbamazepine. Avoid or monitor carbamazepine concentration and adjust dose accordingly. [Severe] Theoretical → Also see TABLE 1 p. 818
- Antifungals, azoles (flucanazole) increase the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to antifungals, azoles (isavuconazole). Avoid. [Severe] Study
- Fosphenytoin very markedly decreases the exposure to antifungals, azoles (itraconazole). Avoid fosphenytoin for 14 days before and during treatment with itraconazole. [Moderate] Study
- Phenytoin very markedly decreases the exposure to antifungals, azoles (itraconazole). Avoid phenytoin for 14 days before and during treatment with itraconazole. [Moderate] Study
- Primidone is predicted to decrease the concentration of antifungals, azoles (itraconazole). [Moderate] Theoretical
- Carbamazepine is predicted to decrease the efficacy of antifungals, azoles (itraconazole), azoles (itraconazole) and antifungals, azoles (itraconazole, voriconazole) increase the concentration of carbamazepine. Avoid or adjust dose. [Moderate] Theoretical → Also see TABLE 1 p. 818
- Carbamazepine is predicted to decrease the efficacy of antifungals, azoles (ketocconazole) and antifungals, azoles (ketocconazole) slightly increase the concentration of carbamazepine. Avoid or monitor carbamazepine concentration and adjust dose accordingly. [Moderate] Study
- Carbamazepine is predicted to decrease the concentration of antifungals, azoles (ketocconazole). Avoid. [Moderate] Study
- Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to antifungals, azoles (posaconazole). Avoid. [Moderate] Study
- Carbamazepine is predicted to decrease the efficacy of antifungals, azoles (posaconazole) and antifungals, azoles (posaconazole) increase the concentration of carbamazepine. Avoid. [Moderate] Theoretical
- Phenobarbital is predicted to decrease the concentration of antifungals, azoles (ketocconazole). Avoid. [Moderate] Study
- Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to antifungals, azoles (posaconazole). Avoid. [Moderate] Study
- Carbamazepine decreases the exposure to antifungals, azoles (voriconazole) and antifungals, azoles (voriconazole) increase the exposure to fosphenytoin. Avoid or adjust voriconazole dose and monitor phenytoin concentration, p. 361. [Moderate] Study
- Phenytoin decreases the exposure to antifungals, azoles (voriconazole) and antifungals, azoles (voriconazole) increase the exposure to phenytoin. Avoid or adjust voriconazole dose and monitor phenytoin concentration, p. 361. [Moderate] Study
- Antiepileptics (phenobarbital, primidone) are predicted to decrease the concentration of antifungals, azoles (voriconazole). [Moderate] Theoretical
- Antifungals, azoles (pyrimethamine) are predicted to decrease the exposure to antimalariais (artemether) (with lumefantrine). Avoid. [Severe] Study
- Antimalariais (pyrimethamine) increase the risk of haematological toxicity when given with antiepileptics (fosphenytoin, phenytoin). [Severe] Study
- Antimalariais (pyrimethamine) are predicted to increase the risk of haematological toxicity when given with antiepileptics (phenobarbital, primidone). [Severe] Theoretical
Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of antimalarials (piperaquine). Avoid. [Moderate] Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to apixaban. Use with caution or avoid. [Severe] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) moderately decrease the exposure to apremilast. Avoid. [Severe] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to aprepitant. Avoid. [Moderate] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to aripiprazole. Adjust aripiprazole dose, p. 240. [Moderate] Study → Also see TABLE 11 p. 820

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to axitinib. Avoid or adjust dose. [Moderate] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to bazedoxifene. [Moderate] Theoretical

Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to beta blockers, non-selective (carvedilol, labetalol). [Moderate] Theoretical

Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to beta blockers, non-selective (propranolol). [Moderate] Study

Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to beta blockers, selective (acebutolol, bisoprolol, metoprolol, nebivolol). [Moderate] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) slightly decrease the exposure to bortezomib. Avoid. [Severe] Study → Also see TABLE 12 p. 821

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) affect the exposure to bosentan. Avoid. [Severe] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to very markedly decrease the exposure to bosutinib. Avoid. [Severe] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to buspirone. Use with caution and adjust dose. [Severe] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) moderately decrease the exposure to cabozantinib. Avoid. [Moderate] Study

Antiepileptics (fosphenytoin, phenytoin) are predicted to moderately increase the clearance of caffeine citrate. Monitor and adjust dose. [Moderate] Study

Calcium channel blockers (diltiazem, verapamil) increase the concentration of carbamazepine. [Severe] Anecdotal

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to calcium channel blockers (diltiazem). [Severe] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to calcium channel blockers (isradipine). Avoid. [Moderate] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to calcium channel blockers (verapamil). [Severe] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to cannabis extract. Avoid. [Severe] Theoretical → Also see TABLE 11 p. 820

Capcitabine increases the concentration of antiepileptics (fosphenytoin, phenytoin). [Severe] Anecdotal

Carbapenems decrease the concentration of valproate. Avoid. [Severe] Anecdotal

Antiepileptics (carbamazepine, fosphenytoin, phenytoin) are predicted to decrease the concentration of caspofungin. Adjust caspofungin dose, p. 356. [Moderate] Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ceritinib. Avoid. [Severe] Study

Antiepileptics (phenobarbital, primidone) decrease the concentration of chloramphenicol. [Moderate] Study

Intravenous chloramphenicol increases the concentration of antiepileptics (fosphenytoin, phenytoin) and antiepileptics (phenytoin, phenytoin) affect the concentration of intravenous chloramphenicol. Monitor concentration and adjust dose. [Severe] Study

Chloralazine increases the concentration of antiepileptics (fosphenytoin, phenytoin). [Severe] Study

Phenobarbital decreases the effects of cholic acid. Avoid. [Moderate] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the concentration of ciclosporin. [Severe] Study

Oxcarbazepine decreases the concentration of ciclosporin. [Severe] Anecdotal

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to alter the effects of clofazimine. [Moderate] Theoretical

Clobazam potentially affects the concentration of antiepileptics (fosphenytoin, phenytoin). [Severe] Anecdotal

Stiripentol increases the concentration of clobazam. [Severe] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to clomethiazole. Monitor and adjust dose. [Moderate] Study → Also see TABLE 11 p. 820

Clonazepam potentially affects the concentration of antiepileptics (fosphenytoin, phenytoin). [Severe] Anecdotal

Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to clozapine. [Severe] Anecdotal

Antiepileptics (phenobarbital, primidone) decrease the exposure to clozapine. [Moderate] Anecdotal

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to cobimetinib. Avoid. [Severe] Theoretical

Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Study

Combined hormonal contraceptives alter the exposure to lamotrigine. Adjust lamotrigine dose, p. 194. [Moderate] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to corticosteroids (budesonide, dexamethasone, methylprednisolone, prednisolone). Monitor and adjust dose. [Moderate] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to corticosteroids (fluticasone). [Unknown] Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to corticosteroids (prednisone). [Mild] Study
Antiepileptics (continued)

- Antiepileptics (fosphenytoin, phenytoin) are predicted to alter the anticoagulant effect of coumarins. [Moderate Anecdotal]
- Antiepileptics (phenobarbital, primidone) decrease the anticoagulant effect of coumarins. Monitor INR and adjust dose. [Moderate Anecdotal]
- Carbamazepine decreases the effects of coumarins. Monitor and adjust dose. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to crizotinib. Avoid. [Severe] Study
- Carbamazepine is predicted to decrease the exposure to dabigatran. Avoid. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to dabrafenib. [Moderate] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to daclatasvir. Avoid. [Severe] Study
- Oxcarbazepine is predicted to decrease the exposure to daclatasvir. Avoid. [Severe] Theoretical
- Danazol moderately increases the concentration of carbamazepine. Monitor carbamazepine concentration and adjust dose. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to darifenacin. [Moderate] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to dasabuvir. Avoid. [Severe] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to datatinib. Avoid. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to slightly decrease the exposure to delamanid. Avoid. [Moderate] Study
- Lamotrigine is predicted to increase the risk of hyponatraemia when given with disulfiram. Avoid. [Severe] Study
- Desogestrel is predicted to increase the exposure to lamotrigine. [Moderate] Study
- Diazepam potentially affects the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Severe] Study
- Diazoxide decreases the concentration of antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the effects of diazoxide. Monitor concentration and adjust dose. [Moderate] Anecdotal
- Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the concentration of digoxin. [Moderate] Anecdotal
- Disulfiram increases the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Severe] Study
- Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical
- Desogestrel is predicted to increase the exposure to lamotrigine. [Moderate] Study
- Diazepam potentially affects the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Severe] Study
- Diazoxide decreases the concentration of antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the effects of diazoxide. Monitor concentration and adjust dose. [Moderate] Anecdotal
- Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the concentration of digoxin. [Moderate] Anecdotal
- Disulfiram increases the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to dolutegravir. Adjust dose. [Severe] Study
- Oxcarbazepine is predicted to decrease the exposure to dolutegravir. Adjust dose. [Severe] Theoretical
- Carbamazepine is predicted to decrease the exposure to edoxaban. [Moderate] Study
- Antiepileptics (fosphenytoin, phenytoin) slightly decrease the exposure to efavirenz and efavirenz affects the concentration of antiepileptics (fosphenytoin, phenytoin). [Severe] Theoretical
- Carbamazepine slightly decreases the exposure to efavirenz and efavirenz slightly decreases the exposure to carbamazepine. [Severe] Study
- Phenobarbital is predicted to decrease the exposure to efavirenz and efavirenz affects the concentration of phenobarbital. [Severe] Theoretical
- Efavirenz is predicted to affect the efficacy of primidone and primidone is predicted to slightly decrease the exposure to efavirenz. [Severe] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to elbasvir. Avoid. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of elvitegravir. Avoid. [Severe] Theoretical
- Enteral feeds decreases the absorption of phenytoin. [Severe] Study
- Enzalutamide is predicted to slightly decrease the exposure to brivaracetam. [Moderate] Theoretical
- Enzalutamide is predicted to decrease the exposure to perampanel. Monitor and adjust dose. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the effects of ergotamine. [Moderate] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to erlotinib. Avoid or adjust erlotinib dose. [Severe] Study
- Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) moderately decrease the exposure to exemestane. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to etosopide. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to etravirine. Avoid. [Severe] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of everolimus. Avoid or adjust dose. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) moderately decrease the exposure to fosoterodine. Avoid. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to fingolimod. [Moderate] Study
- Fluourouracil increases the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Severe] Anecdotal
- Folates (folinic acid) decrease the concentration of antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone). Monitor concentration and adjust dose. [Severe] Study
- Folates (folic acid) are predicted to decrease the concentration of antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone). [Severe] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to fosaprepitant. Avoid. [Moderate] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to gefitinib. Avoid. [Severe] Study
- Grapefruit juice slightly increases the exposure to carbamazepine. Monitor carbamazepine concentration and adjust dose. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to grazoprevir. Avoid. [Severe] Study
- Antiepileptics (phenobarbital, primidone) decrease the effects of griseofulvin. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of guanfacine. Adjust guanfacine dose, p. 222. [Moderate] Study
- Also see TABLE 11 p. 820
Oxcarbazepine is predicted to decrease the concentration of guanfacine. Monitor and adjust guanfacine dose, p. 222. [Moderate] Theoretical

Guanfacine increases the concentration of valproate. Monitor and adjust dose. [Moderate] Study

H₂ receptor antagonists (cimetidine) transiently increase the concentration of carbamazepine. [Moderate] Study

H₂ receptor antagonists (cimetidine) increase the concentration of fosphenytoin. Monitor phenytoin concentration and adjust dose. [Severe] Study

H₂ receptor antagonists (cimetidine) increase the concentration of phenytoin. Monitor phenytoin concentration and adjust dose. [Severe] Study

HIV-protease inhibitors (ritonavir) are predicted to decrease the concentration of saquinavir. Avoid. [Severe] Theoretical

HIV-protease inhibitors are predicted to decrease the exposure to antiepileptics (fosphenytoin, phenytoin) and antiepileptics (phenobarbital, primidone) decrease the concentration of HIV-protease inhibitors. [Severe] Theoretical

HIV-protease inhibitors are predicted to decrease the exposure to carbamazepine and carbamazepine is predicted to decrease the exposure to HIV-protease inhibitors. Monitor and adjust dose. [Severe] Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to slightly increase the exposure to perampanel. [Mild] Study

HIV-protease inhibitors (ritonavir) slightly decrease the exposure to lamotrigine. [Severe] Study

Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the effects of Hormone replacement therapy. [Moderate] Anecdotal

Hormone replacement therapy is predicted to alter the exposure to lamotrigine. [Moderate] Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to liruzon. Avoid. [Severe] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to idelalisib. Avoid. [Severe] Study

Idelalisib is predicted to slightly increase the exposure to perampanel. [Mild] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to imatinib. Avoid. [Moderate] Study

Oxcarbazepine decreases the exposure to imatinib. Avoid. [Moderate] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to irinotecan. Avoid. [Severe] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to iron chelators (deferasirox). Monitor serum ferritin and adjust dose. [Moderate] Theoretical

Isoniazid increases the concentration of antiepileptics (fosphenytoin, phenytoin). [Moderate] Study → Also see TABLE 12 p. 821

Isoniazid markedly increases the concentration of carbamazepine and carbamazepine increases the risk of hepatotoxicity when given with isoniazid. Monitor carbamazepine concentration and adjust dose. [Severe] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ivabradine. Adjust dose. [Moderate] Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) markedly decrease the exposure to ivacaftor. Avoid. [Severe] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to tafamidis. Avoid. [Severe] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ivabradine. Adjust dose. [Moderate] Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ivacaftor. Avoid. [Severe] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ivacaftor. Avoid. [Severe] Study

Carbamazepine is predicted to decrease the exposure to ledipasvir. Avoid. [Severe] Theoretical

Antiepileptics (fosphenytoin, phenytoin) decrease the effects of levodopa. [Moderate] Study

Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of levetiracetam. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical

Antiepileptics (fosphenytoin, phenytoin) increase the risk of hypothyroidism when given with levonorgestrel. [Moderate] Study

Antiepileptics (phenobarbital, primidone) are predicted to decrease the effects of levonorgestrel. [Moderate] Theoretical

Carbamazepine increases the risk of hypothyroidism when given with levonorgestrel. Monitor and adjust dose. [Moderate] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to inaglitin. [Moderate] Study

Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the risk of hypothyroidism when given with liothyronine. [Moderate] Theoretical

Antiepileptics (phenobarbital, primidone) are predicted to decrease the effects of liothyronine. [Moderate] Theoretical

Carbamazepine increases the risk of neurotoxicity when given with lithium. [Severe] Anecdotal

Oxcarbazepine is predicted to increase the risk of neurotoxicity when given with lithium. [Severe] Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to furosemide. [Moderate] Study

Lumacaftor is predicted to decrease the exposure to antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone). Avoid. [Severe] Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to lumacaftor. Avoid. [Severe] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to macitentan. Avoid. [Severe] Study

Macrolides (clarithromycin) slightly increase the concentration of carbamazepine. Monitor carbamazepine concentration and adjust dose. [Severe] Study

Macrolides (clarithromycin) are predicted to slightly increase the exposure to perampanel. [Mild] Study

Macrolides (erythromycin) markedly increase the concentration of carbamazepine. Monitor carbamazepine concentration and adjust dose. [Severe] Study

Levetiracetam decreases the clearance of methotrexate. [Severe] Anecdotal

Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to metronidazole. [Moderate] Study

Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone) decrease the effects of metyrapone. Avoid. [Moderate] Study

→ Also see TABLE 1 p. 818
Antiepileptics (continued)

- Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to mianserin. [Moderate] Study [Also see TABLE 11 p. 820]

- Carbamazepine markedly decreases the exposure to mianserin. Adjust dose. [Moderate] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to midazolam. Monitor and adjust dose. [Moderate] Study [Also see TABLE 11 p. 820]

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to mirtazapine. Adjust dose. [Moderate] Study [Also see TABLE 11 p. 820]

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to modafinil. [Mild] Theoretical

- Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to modafinil and modafinil is predicted to increase the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Moderate] Theoretical

- Antiepileptics (phenobarbital, primidone) are predicted to increase the effects of monoamine-oxidase A and B inhibitors, irreversible. [Severe] Theoretical

- Carbamazepine is predicted to decrease the effects of monoclonal antibodies (brentuximab vedotin). [Severe] Theoretical

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to monoclonal antibodies (trastuzumab emtansine). [Severe] Theoretical

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to montelukast. [Mild] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to nalorexol. Avoid. [Moderate] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to slightly decrease the exposure to nateglinide. [Mild] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to neuropathic pain medications, non-depolarising (atracurium, cisatracurium, pancuronium, rocuronium, vecuronium). [Moderate] Study

- Carbamazepine is predicted to decrease the effects of (but acute use increases the effects of) neuromuscular blocking drugs, non-depolarising (atracurium, cisatracurium, pancuronium, rocuronium, vecuronium). [Moderate] Study

- Nevirapine is predicted to decrease the concentration of antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) and antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of nevirapine. [Severe] Theoretical

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to nintedanib. [Moderate] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to nitisinone. Adjust nitisinone dose. [Moderate] Theoretical

- Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of nortriptyline. For FSRH guidance, see Contraceptives, interactions, p. 474. [Severe] Anecdotal

- Carbamazepine potentially decreases the exposure to olanzapine. Monitor and adjust dose. [Moderate] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to olaparib. Avoid. [Moderate] Theoretical

- Carbamazepine is predicted to decrease the exposure to ombitasvir. Avoid. [Severe] Theoretical

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ondansetron. [Moderate] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to opioids (alfentanil, fentanyl). [Moderate] Study [Also see TABLE 11 p. 820]

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to opioids (buprenorphine). Monitor and adjust dose. [Moderate] Theoretical [Also see TABLE 11 p. 820]

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to opioids (methadone). Monitor and adjust dose. [Severe] Study [Also see TABLE 11 p. 820]

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to opioids (oxycodeone). Monitor and adjust dose. [Moderate] Study [Also see TABLE 11 p. 820]

- Carbamazepine decreases the concentration of opioids (tramadol). Adjust dose. [Severe] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to osimertinib. Avoid. [Moderate] Study

- Oxybutynin potentially increases the risk of overheating and dehydration when given with zonisamide. Avoid in children. [Severe] Theoretical

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to palbociclib. Avoid. [Severe] Study

- Carbamazepine decreases the concentration of paliperidone. Adjust dose. [Moderate] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to panobinostat. Avoid. [Moderate] Theoretical

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to paracetamol. [Moderate] Study [Also see TABLE 1 p. 818]

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. [Severe] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to pazopanib. Avoid. [Severe] Theoretical

- Phenothiazines (chlorpromazine) decrease the concentration of antiepileptics (phenobarbital, primidone) and antiepileptics (phenobarbital, primidone) decrease the concentration of phenothiazines (chlorpromazine). [Moderate] Study [Also see TABLE 11 p. 820]

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (avanafil, tadalafil). Avoid. [Severe] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (sildenafil, vardenafl). [Moderate] Theoretical

- Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to pirfenidone. Avoid. [Moderate] Theoretical

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to pitolisant. [Moderate] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ponatinib. Avoid. [Moderate] Theoretical

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to praziquantel. Avoid. [Moderate] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to increase the risk of
Antiepileptics — Antiepileptics 839

hypersensitivity reactions when given with procarbazine.  
Severe  Anecdotal
> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to quetiapine.  (Moderate) Study  Also see TABLE 11 p. 820
> Quinolones (ciprofloxacin) affect the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose.  (Severe) Study
> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ranolazine. Avoid.  (Severe) Study
> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to reboxetine.  (Moderate) Anecdotal
> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to regorafenib. Avoid.  (Moderate) Study
> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to repaglinide. Monitor blood glucose and adjust dose.  (Moderate) Study
> Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to rifampicin and rifampicin is predicted to decrease the exposure to antiepileptics (phenobarbital, primidone) with caution and adjust dose.  (Moderate) Study
> Rifampicin decreases the concentration of antiepileptics (fosphenytoin, phenytoin). Use with caution and adjust dose.  (Moderate) Study
> Rifampicin slightly decreases the exposure to brivaracetam. Adjust dose.  (Moderate) Study
> Rifampicin markedly increases the clearance of lamotrigine. Adjust lamotrigine dose, p. 194.  (Moderate) Study
> Rifampicin is predicted to decrease the exposure to perampanel. Monitor and adjust dose.  (Moderate) Study
> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) markedly decrease the exposure to riplivirine. Avoid.  (Severe) Study
> Oxcarbazepine is predicted to decrease the concentration of riplivirine. Avoid.  (Severe) Theoretical
> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to risperidone. Adjust risperidone dose.  (Moderate) Study
> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to roflumilast. Avoid.  (Moderate) Study
> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ruxolitinib. Monitor and adjust dose.  (Moderate) Study
> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to saxagliptin.  (Moderate) Study
> Valproate is predicted to increase the exposure to selexipag.  (Unknown) Theoretical
> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to simprevir. Avoid.  (Severe) Theoretical
> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of sirolimus. Avoid.  (Severe) Study
> Valproate increases the exposure to sodium oxybate. Adjust sodium oxybate dose.  (Moderate) Study
> Valproate potentially decreases the effects of sodium oxybate.  (Moderate) Anecdotal
> Antiepileptics (carbamazepine, fosphenytoin, oxcarbazepine, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to sofosbuvir. Avoid.  (Severe) Study
> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to solifenacin.  (Moderate) Theoretical
> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to sorafenib.  (Moderate) Theoretical
> SSRIs (fluoxetine, fluvoxamine) are predicted to increase the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor and adjust dose.  (Severe) Anecdotal
> SSRIs (sertraline) potentially increase the risk of toxicity when given with antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose.  (Severe) Anecdotal
> Antiepileptics (fosphenytoin, phenytoin) decrease the concentration of SSRIs (paroxetine).  (Moderate) Study
> St John’s Wort is predicted to decrease the concentration of antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone). Avoid.  (Severe) Theoretical
> St John’s Wort is predicted to decrease the exposure to brivaracetam.  (Moderate) Theoretical
> St John’s Wort is predicted to decrease the concentration of carbamazepine. Monitor and adjust dose.  (Moderate) Theoretical
> St John’s Wort is predicted to decrease the exposure to perampanel. Monitor and adjust dose.  (Moderate) Theoretical
> Antiepileptics (carbamazepine, eslicarbazepine) are predicted to decrease the exposure to statins (atorvastatin, simvastatin). Monitor and adjust dose.  (Moderate) Theoretical
> Sulfipyrazone increases the concentration of antiepileptics (fosphenytoin, phenytoin). Avoid.  (Moderate) Study
> Sulfonamides (sulfadiazine) are predicted to increase the concentration of fosphenytoin. Monitor and adjust dose.  (Moderate) Study
> Sulfonamides (sulfadiazine) increase the concentration of phenytoin. Monitor and adjust dose.  (Moderate) Study
> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to sunitinib. Avoid or adjust sunitinib dose.  (Moderate) Study
> Antiepileptics (fosphenytoin, phenytoin) increase the effects of suxamethonium.  (Moderate) Study
> Carbamazepine increases the risk of prolonged neuromuscular blockade when given with suxamethonium.  (Moderate) Study
> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the concentration of tacrolimus. Monitor and adjust dose.  (Severe) Study
> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to taxanes (cabazitaxel, paclitaxel). Avoid.  (Severe) Study  Also see TABLE 12 p. 821
> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to taxanes (docetaxel).  (Severe) Theoretical  Also see TABLE 12 p. 821
> Tegafur potentially increases the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose.  (Moderate) Theoretical
> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of temsirolimus. Avoid.  (Severe) Study
> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to tetracyclines (doxycycline). Monitor and adjust dose.  (Moderate) Study  Also see TABLE 1 p. 818
> Antiepileptics (phenobarbital, primidone) are predicted to increase the clearance of theophylline. Adjust dose.  (Moderate) Theoretical
> Carbamazepine potentially increases the clearance of theophylline and theophylline decreases the exposure to carbamazepine. Adjust dose.  (Moderate) Anecdotal
**Antiepileptics (continued)**

- **Fosphenytoin** is predicted to increase the clearance of **theophylline**. Adjust dose. [Moderate] Study
- **Phenytoin** is predicted to decrease the exposure to **theophylline**. Adjust dose. [Moderate] Study
- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to ticagrelor. Avoid. [Severe] Study
- **Antiepileptics** (fosphenytoin, phenytoin) are predicted to increase the clearance of **carbamazepine**. [Moderate] Study
- **Carbamazepine** decreases the clearance of **trazodone**. Adjust dose. [Moderate] Study
- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **tolvaptan**. Avoid. [Severe] Study
- **Antiepileptics** (fusphenytoin, phenytoin) are predicted to increase the clearance of **carbamazepine**. [Moderate] Study
- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **permethrin**. Avoid. [Severe] Study
- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **tracetobedatin**. Avoid. [Moderate] Study
- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **tricetamine**. [Mild] Study
- **Carbamazepine** decreases the clearance of  **tricyclic antidepressants**. [Moderate] Study
- **Carbamazepine** decreases the exposure to **tricyclic antidepressants**. Adjust dose. [Moderate] Study → Also see TABLE 12 p. 822
- **Tricyclic antidepressants** (clomipramine, imipramine) potentially increase the risk of overheating and dehydration when given with **zonisamide**. Avoid in children. [Severe] Theoretical
- **Trimethoprim** increases the concentration of antiepileptics (fosphenytoin, phenytoin). [Moderate] Study
- **Antiepileptics** (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) decrease the efficacy of **ulipristal**. For FSHR guidance, see Contraceptives, interactions p. 474. [Severe] Anecdotal
- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **vandetanib**. Avoid. [Moderate] Study
- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to **velpatasvir**. Avoid. [Severe] Study
- **Oxcarbazepine** is predicted to decrease the exposure to **velpatasvir**. Avoid. [Severe] Theoretical
- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **vemurafenib**. Avoid. [Severe] Theoretical
- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **venetoclax**. Avoid. [Severe] Study
- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **vinca alkaloids** (vinblastine, vincristine, vindesine). [Severe] Theoretical → Also see TABLE 1 p. 818 → Also see TABLE 12 p. 821
- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **vinca alkaloids** (vinflunine). Avoid. [Severe] Theoretical → Also see TABLE 12 p. 821
- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **vinca alkaloids** (vinorelbine). Use with caution or avoid. [Severe] Theoretical → Also see TABLE 12 p. 821
- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **vismodegib**. Avoid. [Moderate] Theoretical
- **Antiepileptics** (fusphenytoin, phenytoin) decrease the effects of **vitamin D substances**. [Moderate] Study
- **Antiepileptics** (phenobarbital, primidone) are predicted to decrease the effects of **vitamin D substances**. [Moderate] Study
- **Carbamazepine** is predicted to decrease the effects of **vitamin D substances**. [Moderate] Study
- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to **vortioxetine**. Monitor and adjust dose. [Moderate] Study
- **Valproate** slightly increases the exposure to **zidovudine**. [Moderate] Study
- **Carbamazepine** moderately decreases the exposure to **zopiclone**. Adjust dose. [Moderate] Study → Also see TABLE 11 p. 820

**Antifungals, azoles** → See TABLE 1 p. 818 (hepatotoxicity), TABLE 9 p. 820 (QT-interval prolongation)

- clotrimazole · **fluconazole** · isavuconazole · itraconazole · ketoconazole · miconazole · posaconazole · voriconazole
- **In general**, **fluconazole** interactions relate to multiple-dose treatment.
- The use of carbonated drinks, such as cola, improves **itraconazole**, **ketoconazole**, and **posaconazole** bioavailability.
- Disulfiram-like reaction might occur with **ketoconazole** on consumption of alcohol.
- Since systemic absorption can follow topical application, the possibility of interactions with topical **ketoconazole** should be borne in mind.
- **Interactions of miconazole** apply to the oral gel formulation, as a sufficient quantity can be absorbed to cause systemic effects. Systemic absorption from intravaginal and topical formulations might also occur.
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to **abiraterone**. [Severe] Theoretical
- **Antifungals, azoles** (itraconazole, ketoconazole) are predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [Moderate] Study
- **Antifungals, azoles** (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to aldosterone antagonists (eplerenone). Adjust eplerenone dose. [Severe] Study
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to aldosterone antagonists (eplerenone). Avoid. [Severe] Study
- **Itraconazole** markedly increases the exposure to **aliskiren**. Avoid. [Severe] Study
- **Ketoconazole** moderately increases the exposure to **aliskiren**. [Moderate] Study
- **Itraconazole** increases the risk of **busulfan** toxicity when given with **alkylating agents** (busulfan). Monitor and adjust dose. [Moderate] Study
- **Miconazole** is predicted to increase the concentration of alkylating agents (busulfan). Use with caution and adjust dose. [Moderate] Theoretical
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) increase the exposure to **almotriptan**. [Mild] Study
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to **alpha blockers** (alfuzosin, tamsulosin). Use with caution or avoid. [Moderate] Study
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to alpha blockers (doxazosin). [Moderate] Study
- **Antifungals, azoles** (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to alpha blockers (tamsulosin). [Moderate] Theoretical
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to **alprazolam**. [Severe] Study
- **Antifungals, azoles** (itraconazole, ketoconazole, posaconazole) are predicted to increase the exposure to **alprazolam**. Avoid. [Moderate] Study
- **Miconazole** is predicted to increase the exposure to **alprazolam**. Use with caution and adjust dose. [Moderate] Theoretical
Antifungals, azoles — Antifungals, azoles

Antacids potentially decrease the exposure to aminoglycosides (tobramycin). [Moderate] Anecdotal

Antacids decrease the absorption of itraconazole. Antacids should be taken 1 hour before or 2 hours after itraconazole. [Moderate] Study

Antacids decrease the absorption of ketoconazole. Separate administration by at least 2 hours. [Moderate] Study

Antiarhythmics (dronedarone) are predicted to increase the exposure to isavuconazole. [Severe] Theoretical

Miconazole is predicted to increase the exposure to antiarrhythmics (disopyramide). Use with caution and adjust dose. [Severe] Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to antiepileptics. [Moderate] Study

Antiepileptics (carbamazepine) are predicted to decrease the exposure to antiepileptics (phenytoin) and carbamazepine. Avoid or adjust dose. [Moderate] Study

Antiepileptics (primidone) are predicted to increase the exposure to antiepileptics (phenytoin). Avoid or adjust dose. [Moderate] Theoretical

Antiepileptics (carbamazepine) are predicted to increase the concentration of antiepileptics. [Moderate] Theoretical

Miconazole increases the risk of carbamazepine toxicity when given with antiepileptics (carbamazepine). Monitor and adjust dose. [Severe] Anecdotal

Miconazole increases the risk of phenytoin toxicity when given with antiepileptics (phenytoin). Monitor and adjust dose. [Severe] Anecdotal

Fluconazole increases the concentration of antiepileptics (phenytoin, phenytoin). Monitor concentration and adjust dose. [Moderate] Study

Antiepileptics (carbamazepine) are predicted to decrease the efficacy of antifungals, azoles (itraconazole, ketoconazole) and antifungals, azoles (itraconazole, voriconazole) increase the concentration of antiepileptics (carbamazepine). Avoid or adjust dose. [Moderate] Theoretical

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to antiepileptics (propafenone). Monitor and adjust dose. [Moderate] Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to antiepileptics (propafenone). Monitor and adjust dose. [Severe] Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to antiepileptics (phenytoin) and carbamazepine. Avoid or monitor carbamazepine concentration and adjust dose accordingly. [Severe] Theoretical

Antiepileptics (carbamazepine) are predicted to decrease the efficacy of fluconazole and fluconazole increases the concentration of antiepileptics (carbamazepine). Avoid or monitor carbamazepine concentration and adjust dose accordingly. [Moderate] Study

Antiepileptics (carbamazepine) are predicted to decrease the efficacy of posaconazole and posaconazole increases the concentration of antiepileptics (carbamazepine). Avoid. [Moderate] Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to isavuconazole. Avoid. [Severe] Study

Antiepileptics (fosphenytoin) very markedly decrease the exposure to itraconazole. Avoid fosphenytoin for 14 days before and during treatment with itraconazole. [Moderate] Study

Antiepileptics (fosphenytoin) decrease the exposure to voriconazole and voriconazole increases the exposure to antiepileptics (fosphenytoin). Avoid or adjust voriconazole dose and monitor phenytoin concentration, p. 361. [Moderate] Study

Antiepileptics (fosphenytoin, phenytoin) decrease the exposure to ketoconazole. Avoid. [Moderate] Study

Antiepileptics (phenobarbital, phenytoin) are predicted to decrease the exposure to ketoconazole. Avoid. [Moderate] Study

Antiepileptics (phenobarbital) decrease the concentration of itraconazole. Avoid phenobarbital for 14 days and during treatment with itraconazole. [Moderate] Study

Antiepileptics (phenobarbital) are predicted to decrease the concentration of ketoconazole. Avoid. [Moderate] Study

Antiepileptics (phenobarbital) are predicted to decrease the concentration of posaconazole. Avoid. [Moderate] Study

Antiepileptics (phenobarbital, primidone) are predicted to decrease the concentration of voriconazole. Avoid. [Moderate] Theoretical

Antiepileptics (phenytoin) very markedly decrease the exposure to itraconazole. Avoid phenytoin for 14 days before and during treatment with itraconazole. [Moderate] Study

Antiepileptics (phenytoin) decrease the exposure to voriconazole and voriconazole increases the exposure to antiepileptics (phenytoin). Avoid or adjust voriconazole dose and monitor phenytoin concentration, p. 361. [Moderate] Study

Antiepileptics (primidone) are predicted to decrease the exposure to itraconazole. [Moderate] Theoretical

Miconazole increases the risk of carbamazepine toxicity when given with antiepileptics (carbamazepine). Monitor and adjust dose. [Severe] Anecdotal

Miconazole increases the risk of phenytoin toxicity when given with antiepileptics (phosphenytoin). Monitor and adjust dose. [Severe] Anecdotal

Fluconazole increases the concentration of antiepileptics (phosphenytoin, phenytoin). Monitor concentration and adjust dose. [Moderate] Study

Antiepileptics (carbamazepine) are predicted to decrease the efficacy of antifungals, azoles (itraconazole, ketoconazole) and antifungals, azoles (itraconazole, voriconazole) increase the concentration of antiepileptics (carbamazepine). Avoid or adjust dose. [Moderate] Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to antifungals, azoles (itraconazole, ketoconazole, posaconazole). Avoid. [Moderate] Study

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to antifungals, azoles (itraconazole, ketoconazole, voriconazole). Avoid. [Moderate] Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to decrease the exposure to antifungals, azoles (itraconazole, ketoconazole, voriconazole). Avoid. [Moderate] Study

Antifungals, azoles (posaconazole) are predicted to increase the exposure to antifungals, azoles (isavuconazole). [Moderate] Theoretical

Miconazole is predicted to increase the exposure to antihistamines, non-sedating (mizolastine). Avoid. [Moderate] Theoretical

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to antifungals, azoles (isavuconazole). Avoid or adjust side effects. [Moderate] Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to antifungals, azoles (isavuconazole). Avoid or monitor side effects. [Moderate] Study

Antifungals, azoles (posaconazole) are predicted to increase the exposure to antifungals, azoles (isavuconazole). [Moderate] Theoretical

Miconazole is predicted to increase the exposure to antihistamines, non-sedating (mizolastine). Avoid. [Moderate] Theoretical

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to antifungals, azoles (isavuconazole). Avoid or adjust side effects. [Moderate] Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to antifungals, azoles (isavuconazole). Avoid or adjust side effects. [Moderate] Study

Antifungals, azoles (posaconazole) are predicted to increase the exposure to antifungals, azoles (isavuconazole). [Moderate] Theoretical

Miconazole is predicted to increase the exposure to antimalarials (artemether) (with lumefantrine). [Moderate] Study

Antifungals, azoles (fluconazole, isavuconazole, voriconazole) are predicted to increase the exposure to antifungals, azoles (isavuconazole). Avoid or adjust side effects. [Moderate] Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to antifungals, azoles (isavuconazole). Avoid or adjust side effects. [Moderate] Study

Antifungals, azoles (posaconazole) are predicted to increase the exposure to antifungals, azoles (isavuconazole). [Moderate] Theoretical

Miconazole is predicted to increase the exposure to antimalarials (mefloquine). [Moderate] Study

Antifungals, azoles (fluconazole, itraconazole, posaconazole, voriconazole) are predicted to increase the exposure to antimalarials (mefloquine). [Moderate] Theoretical

Antifungals, azoles (fluconazole, itraconazole, ketoconazole, posaconazole) are predicted to increase the concentration of antimalarials (piperaquine). [Severe] Theoretical

Itraconazole is predicted to increase the exposure to apixaban. [Severe] Theoretical

Ketoconazole slightly to moderately increases the exposure to apixaban. Avoid. [Severe] Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to apremitan. [Moderate] Study

Apremitan is predicted to increase the exposure to isavuconazole. [Moderate] Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to slightly increase the exposure to apremitan. Adjust apremitan dose, p. 240. [Moderate] Study

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to axitinib. [Moderate] Theoretical 
Antifungals, azoles (continued)
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to arixtnib. Avoid or adjust dose. (Moderate) Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to bedaquiline. Avoid prolonged use. (Mild) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to bedaquiline. Avoid prolonged use. (Mild) Study. Also see TABLE 9 p. 820
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to beta blockers, non-selective (nadolol). (Moderate) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to beta, agonists (salmeterol). Avoid. (Severe) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) slightly increase the exposure to bortezomib. (Moderate) Study
- Fluconazole is predicted to increase the exposure to bosentan. Avoid. (Severe) Study
- Bosentan is predicted to decrease the exposure to isavuconazole. Avoid. (Severe) Theoretical
- Itraconazole is predicted to increase the exposure to bosentan. (Moderate) Theoretical
- Ketoconazole moderately increases the exposure to bosentan. (Moderate) Study
- Voriconazole is predicted to increase the exposure to bosentan. Avoid. (Severe) Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to bosutinib. Avoid or adjust bosutinib dose. (Severe) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to bosutinib. Avoid or adjust bosutinib dose. (Severe) Study. Also see TABLE 9 p. 820
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to buspirone. Use with caution and adjust dose. (Moderate) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to buspirone. Adjust buspirone dose. (Severe) Study
- Miconazole is predicted to increase the concentration of buspirone. Use with caution and adjust dose. (Moderate) Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to cabazitaxel. (Moderate) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) slightly increase the exposure to cabazitaxel. (Moderate) Study. Also see TABLE 9 p. 820
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to isavuconazole. (Moderate) Theoretical
- Miconazole is predicted to increase the exposure to calcium channel blockers (amlodipine, clevidipine, felodipine, isradipine, lidacipine, lercanidipine, nicardipine, nifedipine, nimodipine, verapamil). Use with caution and adjust dose. (Moderate) Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the exposure to isavuconazole. (Moderate) Theoretical
- Fluconazole (high-dose) is predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). (Moderate) Theoretical
- Posaconazole is predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). (Moderate) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). (Severe) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to calcium channel blockers (lercanidipine). Avoid. (Severe) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to cannabis. Avoid or adjust cannabis. (Moderate) Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to cannabis. Avoid or adjust cannabis. (Severe) Study. Also see TABLE 9 p. 820
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to cannabis. Avoid or adjust cannabis. (Severe) Study
- Miconazole increases the concentration of ciclosporin. Monitor and adjust dose. (Severe) Theoretical
- Miconazole increases the concentration of ciclosporin. Monitor and adjust dose. (Severe) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of ciclosporin. (Severe) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of ciclosporin. (Severe) Study
- Ciclosporin is predicted to increase the exposure to ciclosporin. Adjust ciclosporin dose. (Moderate) Study
- Fluconazole is predicted to increase the exposure to ciclosporin. (Moderate) Study
- Fluconazole is predicted to increase the exposure to ciclosporin. Use with caution and adjust dose. (Moderate) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to ciclosporin. Adjust ciclosporin dose. (Moderate) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to cyclosporin. Avoid or monitor side effects. (Severe) Study
- Ciclosporin is predicted to increase the exposure to itraconazole. Adjust itraconazole dose. (Moderate) Theoretical
- Ciclosporin is predicted to increase the exposure to ketoconazole. Adjust ketoconazole dose. (Moderate) Theoretical
- Ciclosporin is predicted to affect the exposure to voriconazole. Avoid. (Moderate) Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, miconazole, posaconazole) are predicted to increase the exposure to cobimetinib. (Severe) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to cobimetinib. Avoid or monitor for toxicity. (Severe) Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to colchicine. Adjust colchicine dose. (Severe) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to colchicine. Avoid or adjust colchicine dose. (Severe) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to corticosteroids (budesonide). Avoid. (Severe) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to corticosteroids (budesonide). Avoid. (Severe) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to corticosteroids (budesonide). Avoid. (Severe) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to corticosteroids (budesonide). Avoid. (Severe) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to corticosteroids (budesonide). Avoid. (Severe) Study
- Miconazole is predicted to increase the concentration of corticosteroids (methylprednisolone). Monitor and adjust dose. (Moderate) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. (Moderate) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. (Moderate) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. (Moderate) Study
- Miconazole is predicted to increase the concentration of corticosteroids (methylprednisolone). Monitor and adjust dose. (Moderate) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. (Moderate) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. (Moderate) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. (Moderate) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. (Moderate) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. (Moderate) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. (Moderate) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. (Moderate) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. (Moderate) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. (Moderate) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. (Moderate) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. (Moderate) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. (Moderate) Theoretical
Fluconazole increases the anticoagulant effect of coumarins. Monitor INR and adjust dose. 

Itraconazole potentially increases the anticoagulant effect of coumarins. 

Ketoconazole potentially increases the anticoagulant effect of coumarins (warfarin). Monitor INR and adjust dose. 

Miconazole greatly increases the anticoagulant effect of coumarins. 

Voriconazole increases the anticoagulant effect of coumarins. Monitor INR and adjust dose. 

Antifungals, azoles (fluconazole, posaconazole) are predicted to increase the exposure to crizotinib. 

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to crizotinib. Avoid. 

Crizotinib is predicted to increase the exposure to isavuconazole. 

Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the exposure to dabigatran. Avoid. 

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ddarabafenib. Use with caution or avoid. 

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to daclatasvir. Adjust daclatasvir dose. 

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to slightly increase the exposure to darifenacin. 

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to darifenacin. Avoid. 

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to dasatinib. 

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to dasatinib. Avoid. 

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) very slightly increase the exposure to delamanid. Avoid. 

Antifungals, azoles (fluconazole, voriconazole) moderately increase the exposure to diazepam. Monitor and adjust dose. 

Didanosine (buffered) decreases the exposure to antifungals, azoles (itraconazole, ketoconazole). Separate administration by 2 hours. 

Itraconazole markedly increases the concentration of digoxin. Monitor and adjust dose. 

Ketoconazole is predicted to markedly increase the concentration of digoxin. 

Posaconazole is predicted to increase the concentration of digoxin. 

Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole) increase the risk of QT-prolongation when given with domperidone. Avoid. 

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to dopamine receptor agonists (bromocriptine, cabergoline). 

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) increase the exposure to dopamine receptor agonists (bromocriptine, cabergoline). 

Ketoconazole moderately increases the exposure to drospirenone. 

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to moderately increase the exposure to dutasteride. 

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to dutasteride. Monitor side effects and adjust dose. 

Itraconazole is predicted to slightly increase the exposure to edoxaban. 

Ketoconazole slightly increases the exposure to edoxaban. Adjust edoxaban dose. 

Efavirenz is predicted to decrease the exposure to isavuconazole. Avoid. 

Efavirenz slightly decreases the exposure to itraconazole. Avoid efavirenz for 14 days before and during treatment with itraconazole. 

Efavirenz moderately decreases the exposure to ketoconazole. 

Efavirenz slightly decreases the exposure to posaconazole. Avoid. 

Efavirenz moderately decreases the exposure to voriconazole and posaconazole slightly increases the exposure to efavirenz. Adjust dose. 

Efavirenz is predicted to increase the exposure to voriconazole and posaconazole when given with elbasvir. Avoid. 

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to eletriptan. Avoid. 

Enzalutamide is predicted to decrease the exposure to isavuconazole. Avoid. 

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the risk of ergotism when given with ergometrine. Avoid. 

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the risk of ergotism when given with ergotamine. Avoid. 

Miconazole is predicted to increase the exposure to ergotamine. Avoid. 

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the risk of ergotism when given with ergotamine. Avoid. 

Miconazole is predicted to increase the exposure to ergotamine. Avoid. 

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to erlotinib. 

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to slightly increase the exposure to erlotinib. Use with caution and adjust dose. 

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the concentration of everolimus. Avoid or adjust dose. 

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of everolimus. Avoid. 

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to fosoterodine. Adjust fosoterodine dose in hepatic and renal impairment. 

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to fosoterodine. Adjust fosoterodine dose; avoid in hepatic and renal impairment. 

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to fidaxomicin. Avoid. 

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to fosaprepitant. Avoid. 

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to gefitinib. 

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to gefitinib. 

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to grazoprevir. Avoid. 

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the concentration of guafenacine. Adjust guafenacine dose, p. 222. 

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to guafenacine. Adjust guafenacine dose, p. 222.
Antifungals, azoles (continued)

- **H₂ receptor antagonists** are predicted to decrease the absorption of **itraconazole**. Administer **itraconazole capsules** with an acidic beverage. [Moderate] Study
- **H₂ receptor antagonists** are predicted to decrease the absorption of **ketocazole**. Administer **ketocazole** with an acidic beverage. [Moderate] Study
- **H₂ receptor antagonists** are predicted to slightly decrease the exposure to **posaconazole**. Avoid use of posaconazole oral suspension. [Moderate] Study
- **Itraconazole** increases the concentration of **haloperidol**. [Moderate] Study
- **HIV-protease inhibitors** (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to **itraconazole**. Avoid or monitor side effects. [Severe] Study
- **Fluconazole** slightly increases the exposure to **HIV-protease inhibitors** (tipranavir). Avoid or adjust dose. [Moderate] Study
- **HIV-protease inhibitors** are predicted to increase the exposure to **itraconazole**. Use with caution and adjust dose. [Severe] Study
- **Itraconazole** is predicted to increase the concentration of **HIV-protease inhibitors**. Use with caution and adjust dose. [Moderate] Study
- **Posaconazole** is predicted to increase the exposure to **HIV-protease inhibitors**. [Moderate] Study
- **HIV-protease inhibitors** are predicted to affect the exposure to **voriconazole** and **posaconazole** potentially affects the exposure to **HIV-protease inhibitors**. [Severe] Study → Also see **TABLE 9** p. 820
- Antifungals, azoles (**flucytosine**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **ibutilide**. Avoid or adjust **ibutilide** dose. [Severe] Theoretical
- Antifungals, azoles (**itraconazole**, **ketocazole**, **voriconazole**) are predicted to very markedly increase the exposure to **ibutilide**. Avoid or adjust **ibutilide** dose. [Severe] Study
- **Ivalolisib** is predicted to increase the exposure to **isavuconazole**. Avoid or monitor side effects. [Severe] Study
- Antifungals, azoles (**flucytosine**, **posaconazole**) are predicted to increase the exposure to **imatinib**. [Moderate] Theoretical
- Antifungals, azoles (**itraconazole**, **ketocazole**, **voriconazole**) are predicted to increase the exposure to **imatinib**. [Moderate] Study
- **Imatinib** is predicted to decrease the exposure to **isavuconazole**. [Moderate] Theoretical
- Antifungals, azoles (**itraconazole**, **ketocazole**, **voriconazole**) are predicted to increase the risk of toxicity when given with **irinotecan**. Avoid. [Moderate] Study
- Antifungals, azoles (**flucytosine**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **ivabradine**. Adjust **ivabradine** dose. [Severe] Theoretical
- Antifungals, azoles (**itraconazole**, **ketocazole**, **voriconazole**) are predicted to increase the exposure to **ivabradine**. Avoid. [Severe] Study
- Antifungals, azoles (**flucytosine**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **ivacaftor**. Adjust **ivacaftor** dose, p. 179. [Severe] Study
- Antifungals, azoles (**itraconazole**, **ketocazole**, **voriconazole**) are predicted to increase the exposure to **ivacaftor**. Adjust **ivacaftor** or **lumacaftor** with **ivacaftor** dose, p. 179. [Severe] Study
- Lanthanum is predicted to decrease the absorption of **ketocazole**. Separate administration by at least 2 hours. [Moderate] Theoretical
- Antifungals, azoles (**flucytosine**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **lapatinib**. [Moderate] Study
- Antifungals, azoles (**itraconazole**, **ketocazole**, **voriconazole**) are predicted to increase the exposure to **lapatinib**. Avoid. [Moderate] Study → Also see **TABLE 9** p. 820
- Antifungals, azoles (**flucytosine**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **lomitapide**. Avoid. [Moderate] Theoretical → Also see **TABLE 1** p. 818
- Antifungals, azoles (**itraconazole**, **ketocazole**, **voriconazole**) are predicted to markedly increase the exposure to **lomitapide**. Avoid. [Severe] Study → Also see **TABLE 1** p. 818
- **Clotrimazole** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
- **Lumacaftor** is predicted to decrease the exposure to antifungals, azoles (**itraconazole**, **ketocazole**, **voriconazole**). [Moderate] Theoretical
- **Lumacaftor** is predicted to decrease the exposure to **fluconazole**. Adjust dose. [Mild] Theoretical
- **Lumacaftor** is predicted to decrease the exposure to **posaconazole**. Avoid. [Moderate] Theoretical
- Antifungals, azoles (**flucytosine**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **lurasidone**. [Moderate] Study
- Antifungals, azoles (**itraconazole**, **ketocazole**, **voriconazole**) are predicted to increase the exposure to **lurasidone**. Avoid. [Severe] Study
- Antifungals, azoles (**itraconazole**, **ketocazole**, **voriconazole**) are predicted to increase the exposure to **macitentan**. [Moderate] Study
- **Macrolides** (clarithromycin) are predicted to increase the exposure to **isavuconazole**. Avoid or monitor side effects. [Severe] Study
- **Macrolides** (erythromycin) are predicted to increase the exposure to **isavuconazole**. [Moderate] Theoretical
- Antifungals, azoles (**itraconazole**, **ketocazole**, **voriconazole**) markedly increase the exposure to **maraviroc**. Adjust dose. [Severe] Study
- **Miconazole** is predicted to increase the exposure to oral **midazolam**. Avoid. [Moderate] Theoretical
- Antifungals, azoles (**itraconazole**, **ketocazole**, **voriconazole**) are predicted to increase the exposure to **mirabegron**. Adjust **mirabegron** dose in hepatic and renal impairment. [Moderate] Study
- Antifungals, azoles (**itraconazole**, **ketocazole**, **voriconazole**) are predicted to increase the exposure to **mitazolamide**. [Moderate] Study
- Antifungals, azoles (**itraconazole**, **ketocazole**, **voriconazole**) are predicted to increase the exposure to **modafinil**. [Mild] Theoretical
- Antifungals, azoles (**itraconazole**, **ketocazole**, **voriconazole**) increase the risk of neutropenia when given with monoclonal antibodies (brentuximab vedotin). Monitor and adjust dose. [Severe] Study
- Antifungals, azoles (**itraconazole**, **ketocazole**, **voriconazole**) are predicted to markedly increase the exposure to **naloxygol**. Adjust **naloxygol** dose and monitor side effects. [Moderate] Study
- Antifungals, azoles (**itraconazole**, **ketocazole**, **voriconazole**) are predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor side effects. [Moderate] Study
- Antifungals, azoles (**itraconazole**, **ketocazole**, **voriconazole**) are predicted to increase the exposure to **mofordinil**. [Mild] Theoretical
- Antifungals, azoles (**itraconazole**, **ketocazole**, **voriconazole**) are predicted to increase the exposure to **netupitant**. [Mild] Study
- **Netupitant** is predicted to decrease the exposure to **isavuconazole**. [Moderate] Theoretical
- **Fluconazole** slightly to moderately increases the exposure to **nevirapine**. [Moderate] Study
- **Nevirapine** is predicted to decrease the exposure to **isavuconazole**. Avoid. [Severe] Theoretical
- **Nevirapine** moderately decreases the exposure to **itraconazole**. Avoid **nevirapine** for 14 days before and during treatment with **itraconazole**. [Moderate] Study
- **Nevirapine** moderately decreases the exposure to **ketocazole**. Avoid. [Severe] Study
- **Nevirapine** is predicted to decrease the exposure to **voriconazole** and **voriconazole** increases the exposure to **nevirapine**. Monitor and adjust dose. [Severe] Theoretical
- Antifungals, azoles (fluconazole, posaconazole) are predicted to increase the exposure to nilotinib. Moderate Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to nilotinib. Avoid. Severe Study → Also see TABLE 9 p. 820
- Nilotinib is predicted to increase the exposure to isavuconazole. Moderate Theoretical
- Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the exposure to nintedanib. Moderate Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to nitisinone. Adjust nitisinone dose. Moderate Theoretical
- Fluconazole moderately increases the exposure to NSAIDs. Moderate Theoretical
- Voriconazole slightly increases the exposure to NSAIDs. Moderate Theoretical
- Voriconazole moderately increases the exposure to NSAIDs. Moderate Theoretical
- Fluconazole increases the exposure to NSAIDs. Moderate Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose. Moderate Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose. Moderate Study
- Miconazole is predicted to increase the exposure to opioids ( alfentanil). Use with caution and adjust dose. Moderate Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. Moderate Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to opioids ( alfentanil, buprenorphine, fentanyl, oxycodone, sufentanil). Monitor and adjust dose. Moderate Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to oxymorphone. Moderate Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to oxymorphone. Moderate Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to oxymorphone. Mild Study → Also see TABLE 9 p. 820
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to oxymorphone. Mild Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to pethidine. Severe Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to pethidine. Severe Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to pazopanib. Moderate Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to pazopanib. Moderate Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to pazopanib. Moderate Study
- Miconazole is predicted to increase the concentration of pethidine. Use with caution and adjust dose. Moderate Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to repaglinide. Moderate Study
Antifungals, azoles (continued)

- Antifungals, azoles (fluconazole, itraconazole, ketoconazole, miconazole, voriconazole) are predicted to increase the exposure to retinoids (altretinoin). Adjust altretinoin dose. **Moderate** Theoretical

- Antifungals, azoles (fluconazole, ketoconazole, voriconazole) are predicted to increase the risk of tretinoin toxicity when given with retinoids (tretinoin). **Moderate** Study

- Antifungals, azoles (itraconazole, posaconazole) increase the concentration of rifabutin and rifabutin decreases the concentration of antifungals, azoles (itraconazole, posaconazole). Avoid. **Severe** Study

- Fluconazole increases the risk of uveitis when given with rifabutin. Adjust dose. **Severe** Study

- Rifabutin is predicted to decrease the exposure to isavuconazole. Avoid. **Severe** Theoretical

- Ketoconazole is predicted to increase the concentration of rifabutin and rifabutin is predicted to decrease the concentration of ketoconazole. Avoid. **Severe** Theoretical

- Miconazole is predicted to increase the concentration of rifabutin. Use with caution and adjust dose. **Moderate** Theoretical

- Rifabutin decreases the concentration of voriconazole and voriconazole increases the concentration of rifabutin. Avoid or adjust voriconazole dose. p. 361. **Severe** Study

- Rifampicin slightly decreases the exposure to fluconazole. Adjust dose. **Moderate** Study

- Rifampicin is predicted to decrease the exposure to isavuconazole. Avoid. **Severe** Study

- Rifampicin markedly decreases the exposure to itraconazole. Avoid rifampicin for 14 days before and during treatment with itraconazole. **Moderate** Study

- Rifampicin markedly decreases the exposure to ketoconazole and ketoconazole potentially decreases the exposure to rifampicin. Avoid. **Moderate** Study

- Rifampicin is predicted to decrease the exposure to posaconazole. Avoid. **Moderate** Anecdotal

- Rifampicin very markedly decreases the exposure to voriconazole. Avoid. **Moderate** Study

- Itraconazole is predicted to increase the exposure to riociguat. Avoid. **Moderate** Study

- Ketoconazole moderately increases the exposure to riociguat. Avoid. **Moderate** Study

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to risperidone. Adjust dose. **Moderate** Study → Also see TABLE 9 p. 820

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to rivaroxaban. Avoid. **Severe** Study

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ruxolitinib. **Moderate** Theoretical

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to saxagliptin. **Mild** Study

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to saxagliptin. **Mild** Study

- Fluconazole is predicted to increase the exposure to selexipag. **Unknown** Theoretical

- Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the exposure to siemprevir. Avoid. **Severe** Study

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) increase the concentration of sirolimus. Monitor and adjust dose. **Moderate** Study

- Itraconazole is predicted to increase the concentration of sirolimus. Monitor and adjust dose. **Moderate** Study

- Miconazole is predicted to increase the concentration of sirolimus. Monitor and adjust dose. **Moderate** Study

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to solifenacin. Adjust solifenacin or tamsulosin with solifenacin dose; avoid in hepatic and renal impairment. **Severe** Study

- Voriconazole is predicted to increase the exposure to SSRIs (citalopram). **Severe** Theoretical → Also see TABLE 9 p. 820

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to SSRIs (dapoxetine). Adjust dapoxetine dose. **Moderate** Theoretical

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to SSRIs (dapoxetine). Avoid or adjust dapoxetine dose. **Severe** Study

- **ST John’s Wort** is predicted to decrease the exposure to isavuconazole. Avoid. **Severe** Theoretical

- **ST John’s Wort** moderately decreases the exposure to voriconazole. Avoid. **Moderate** Study

- Miconazole potentially increases the exposure to statins (atorvastatin). Avoid. **Anecdotal**

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to statins (atorvastatin). Monitor and adjust dose. **Severe** Theoretical → Also see TABLE 1 p. 818

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to statins (atorvastatin). Avoid or adjust dose and monitor rhabdomyolysis. **Severe** Study → Also see TABLE 1 p. 818

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to statins (simvastatin). **Severe** Study

- Antifungals, azoles (fluconazole, miconazole, voriconazole) are predicted to increase the exposure to sulfonyleureas. Use with caution and adjust dose. **Moderate** Study

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to suniflurid. **Severe** Theoretical

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to slightly increase the exposure to suniflurid. Avoid or adjust suniflurid dose. **Moderate** Study → Also see TABLE 9 p. 820

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the concentration of tacrolimus. **Severe** Study

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of tacrolimus. Monitor and adjust dose. **Severe** Theoretical

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to taxanes (cabazitaxel). **Moderate** Theoretical

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to taxanes (cabazitaxel). Use with caution and adjust dose. **Moderate** Study

- Miconazole is predicted to increase the concentration of taxanes (docetaxel). Use with caution and adjust dose. **Moderate** Theoretical

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to taxanes (docetaxel). Avoid or adjust dose. **Severe** Study

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to taxanes (paclitaxel). **Severe** Theoretical

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the concentration of temsirolimus. **Moderate** Theoretical

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of temsirolimus. Avoid. **Severe** Theoretical

**TABLE 1** p. 818

**TABLE 9** p. 820

---

846 Antifungals, azoles – Antifungals, azoles

BNFC 2017–2018
Antifungals, azoles — Antihistamines, sedating

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ticagrelor. Avoid. [Severe] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to tolterodine. [Mild] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to toprtcegan. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to trazodone. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to vemurafenib. [Severe] Theoretical → Also see TABLE 9 p. 820
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to venlafaxine. [Moderate] Study → Also see TABLE 9 p. 820
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to venooclax dose. [Severe] Study → Also see TABLE 9 p. 820
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to venlafaxine. [Moderate] Study → Also see TABLE 9 p. 820
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to vinca alkaloids. [Severe] Theoretical → Also see TABLE 1 p. 818 → Also see TABLE 9 p. 820
- Miconazole is predicted to increase the concentration of vinca alkaloids. Use with caution and adjust dose. [Moderate] Theoretical
- Antifungals, azoles (clotrimazole, ketoconazole) are predicted to decrease the exposure to vitamin D substances (colecalciferol). [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to vitamin D substances (paricalcitol). [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Study
- Antihistamines, non-sedating → see TABLE 9 p. 820 (QT-interval prolongation)

Antihistamines, sedating → see Table 9 p. 820 (QT-interval prolongation), TABLE 11 p. 820 (CNS depressant effects), TABLE 10 p. 820 (antimuscarinics)

- Antihistamines, sedating
  - aminedamine - buclizine - chlorphenamine - cinnarizine - Clemastine - cyclizine - cyproheptadine - hydroxyzine - ketotifen - pizotifen - promethazine

ROUTE-SPECIFIC INFORMATION
Since systemic absorption can follow topical application of ketotifen, the possibility of interactions should be borne in mind.

- Hydroxyzine potentially increases the risk of overheating and dehydration when given with antiepileptics (zonisamide). Avoid in children. [Severe] Theoretical

FOOD AND LIFESTYLE
- Apple juice and orange juice decrease the exposure to fexofenadine.
- Antacids decrease the absorption of fexofenadine. Separate administration by 2 hours. [Mild] Study

- Antihistamines (dronedarone) are predicted to increase the exposure to antihistamines, non-sedating (fexofenadine, mizolastine). [Severe] Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to mizolastine. [Severe] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to mizolastine. [Severe] Theoretical
Antihistamines, sedating (continued)

- **Antihistamines, sedating** are predicted to decrease the effects of **beta blockers**. [Moderate] Theoretical
- **Antihistamines, sedating** are predicted to decrease the effects of **histamine**. Avoid. [Severe] Theoretical
- **Cyproheptadine** decreases the effects of **metyrapone**. Avoid. [Moderate] Study
- **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the risk of antimuscarinic side-effects when given with **antihistamines, sedating**. Avoid. [Severe] Theoretical

Antimalarials → see TABLE 15 p. 821 (myelosuppression), TABLE 9 p. 820 (QT-interval prolongation)

- **artemether** - **atovaquone** - **chloroquine** - **lumefantrine** - **mefloquine** - **piperaquine** - **primaquine** - **proguanil** - **pyrimethamine** - **quinine**

**PHARMACOLOGY** Piperaquine has a long half-life; there is a potential for drug interactions to occur for up to 3 months after treatment has been stopped.

- **Chloroquine** is predicted to decrease the effects of **agalsidase**. Avoid. [Moderate] Theoretical
- **Antimalarials** (**chloroquine**, ** primaquine**) are predicted to increase the risk of methaemoglobinaemia when given with topical anaesthetics, local (prilocaine). Use with caution or avoid. [Severe] Theoretical
- **Antacids** decrease the absorption of **chloroquine**. Separate administration by at least 4 hours. [Moderate] Study
- **Antacids** are predicted to decrease the absorption of **proguanil**. Separate administration by at least 2 hours. [Moderate] Study
- **Antirrhythms** (**dronedarone**) are predicted to increase the concentration of **piperaquine**. [Severe] Theoretical
- **Antiepileptics** (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to **artemether** (with lumefantrine). Avoid. [Severe] Study
- **Antiepileptics** (**carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone**) are predicted to decrease the concentration of **piperaquine**. Avoid. [Moderate] Theoretical
- **Pyrimethamine** increases the risk of haematological toxicity when given with **antiepileptics** (**fosphenytoin, phenytoin**). [Severe] Study
- **Pyrimethamine** is predicted to increase the risk of haematological toxicity when given with **antiepileptics** (**phenobarbital, primidone**). [Severe] Theoretical
- **Antifungals, azoles** (**flucytosine**, **isavuconazole**, **itraconazole**, **ketoconazole**, **posaconazole, voriconazole**) are predicted to increase the concentration of **piperaquine**. [Severe] Theoretical
- **Antifungals, azoles** (**flucytosine**, **itraconazole**, **posaconazole, voriconazole**) are predicted to increase the exposure to **mefloquine**. [Moderate] Theoretical
- **Antifungals, azoles** (**itraconazole**, **ketoconazole, voriconazole**) are predicted to increase the exposure to **artemether** (with lumefantrine). [Moderate] Study → Also see TABLE 9 p. 820
- **Antifungals, azoles** (**ketoconazole**, **voriconazole**) increase the exposure to **mefloquine**. [Moderate] Study
- **Antimalarials** (**proguanil**) are predicted to increase the risk of side-effects when given with antimalarials (**pyrimethamine**). [Severe] Theoretical
- **Aprepitant** is predicted to increase the concentration of **piperaquine**. [Severe] Theoretical
- **Mefloquine** is predicted to increase the risk of bradycardia when given with **beta blockers, non-selective**. [Severe] Theoretical
- **Mefloquine** is predicted to increase the risk of bradycardia when given with **calcium channel blockers**. [Severe] Theoretical
- **Mefloquine** is predicted to increase the risk of bradycardia when given with **calcium channel blockers**. [Severe] Theoretical
- **Calcium salts** (**calcium carbonate**) decrease the absorption of **chloroquine**. Separate administration by at least 4 hours. [Moderate] Study
- **Calcium salts** (**calcium carbonate**) are predicted to decrease the absorption of **proguanil**. Separate administration by at least 2 hours. [Moderate] Study
- **Chloroquine** decreases the efficacy of oral **cholera vaccine**. [Moderate] Study
- **Cobicistat** is predicted to increase the exposure to **artemether** (with lumefantrine). [Moderate] Study
- **Cobicistat** is predicted to increase the concentration of **piperaquine**. [Severe] Theoretical
- **Crizotinib** is predicted to increase the concentration of **piperaquine**. [Severe] Theoretical
- **Antimalarials** (**chloroquine, primaquine**) are predicted to increase the risk of methaemoglobinaemia when given with **dapsone**. [Severe] Theoretical
- **Mefloquine** is predicted to increase the risk of bradycardia when given with **digoxin**. [Severe] Theoretical
- **Quinine** increases the concentration of **digoxin**. Monitor and adjust digoxin dose, p. 79. [Severe] Anecdotal
- **Efavirenz** decreases the concentration of **artemether**. [Severe] Study
- **Efavirenz** moderately decreases the exposure to **atovaquone**. Avoid. [Moderate] Study
- **Efavirenz** affects the exposure to **proguanil**. Avoid. [Moderate] Study
- **Enzalutamide** is predicted to decrease the exposure to **artemether** (with lumefantrine). Avoid. [Severe] Study
- **Enzalutamide** is predicted to decrease the concentration of **piperaquine**. Avoid. [Moderate] Theoretical
- **Etravirine** decreases the concentration of **artemether**. [Moderate] Study
- **Grapefruit juice** increases the exposure to **artemether**. [Unknown] Study
- **Grapefruit juice** is predicted to increase the concentration of **proguanil**. Avoid. [Severe] Theoretical
- **H₄ receptor antagonists** (**cimetidine**) decrease the clearance of **chloroquine**. [Moderate] Study
- **H₂ receptor antagonists** (**cimetidine**) slightly increase the exposure to **quinine**. [Moderate] Study
- **Antimalarials** (**artemether, atovaquone, chloroquine, mefloquine, primaquine, proguanil, pyrimethamine, quinine**) are predicted to affect the exposure to **histamine**. Avoid. [Severe] Theoretical
- **HIV-protease inhibitors** (**atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir**) are predicted to increase the exposure to **artemether** (with lumefantrine). [Moderate] Study → Also see TABLE 9 p. 820
- **HIV-protease inhibitors** decrease the exposure to **atovaquone**. Avoid if boosted with ritonavir. [Moderate] Study
- **HIV-protease inhibitors** are predicted to increase the concentration of **piperaquine**. [Severe] Theoretical
- **HIV-protease inhibitors** are predicted to decrease the exposure to **proguanil**. Avoid. [Moderate] Study
- **HIV-protease inhibitors** are predicted to affect the exposure to **quinine**. [Severe] Study → Also see TABLE 9 p. 820
- **Idelalisib** is predicted to increase the exposure to **artemether** (with lumefantrine). [Moderate] Study
- **Idelalisib** is predicted to increase the concentration of **piperaquine**. [Severe] Theoretical
- **Imatinib** is predicted to increase the concentration of **piperaquine**. [Severe] Theoretical
- **Lanthanum** is predicted to decrease the absorption of **chloroquine**. Separate administration by at least 2 hours. [Moderate] Theoretical
- **Chloroquine** is predicted to decrease the exposure to **laronidase**. Avoid simultaneous administration. [Severe] Theoretical
- **Macrolides** (**clarithromycin**) are predicted to increase the exposure to **artemether** (with lumefantrine). [Moderate] Study → Also see TABLE 9 p. 820
- **Macrolides** (**clarithromycin, erythromycin**) are predicted to increase the concentration of **piperaquine**. [Severe] Theoretical
- **Mepacrine** is predicted to increase the concentration of **primaquine**. Avoid. [Moderate] Theoretical
- **Pyrimethamine** is predicted to increase the risk of side-effects when given with **methotrexate**. [Severe] Theoretical → Also see TABLE 15 p. 821
- Metoclopramide decreases the concentration of atovaquone. Avoid. (Moderate) Study
- Netupitant is predicted to increase the concentration of piperaquine. (Severe) Theoretical
- Nilotinib is predicted to increase the concentration of piperaquine. (Severe) Theoretical
- Pyrimethamine is predicted to increase the risk of side-effects when given with pemetrexed. (Severe) Theoretical  Also see TABLE 15 p. 821
- Chloroquine is predicted to increase the risk of haematological toxicity when given with penicillamine. Avoid. (Severe) Theoretical
- Chloroquine moderately decreases the exposure to praziquantel. Use with caution and adjust dose. (Moderate) Study
- Chloroquine decreases the efficacy of rabies vaccine. Avoid. (Moderate) Study
- Rifabutin slightly decreases the exposure to atovaquone. Avoid. (Moderate) Study
- Rifampicin is predicted to decrease the exposure to atovaquone. Avoid. (Moderate) Study
- Rifampicin is predicted to decrease the concentration of piperaquine. Avoid. (Moderate) Theoretical
- Rifampicin is predicted to decrease the exposure to mefloquine. Avoid. (Moderate) Theoretical
- St John’s Wort is predicted to decrease the concentration of piperaquine. Avoid. (Moderate) Theoretical
- Pyrimethamine increases the risk of side-effects when given with sulfonamides. (Severe) Study  Also see TABLE 15 p. 821
- Tetracyclines (tetracycline) decrease the concentration of atovaquone. (Moderate) Study
- Pyrimethamine increases the risk of side-effects when given with trimethoprim. (Severe) Study
- Pyrimethamine is predicted to increase the risk of side-effects when given with zidovudine. (Severe) Theoretical  Also see TABLE 15 p. 821
- Apixaban  see TABLE 3 p. 818 (anticoagulant effects)
- Antiarhythmics (dronedarone) are predicted to increase the exposure to apixaban. (Moderate) Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to apixaban. Use with caution or avoid. (Severe) Study
- Antifungals, azoles (itraconazole) are predicted to increase the exposure to apixaban. Avoid. (Severe) Theoretical
- Antifungals, azoles (ketocanazole) slightly increase the exposure to apixaban. Avoid. (Severe) Study
- Calcium channel blockers (verapamil) are predicted to increase the exposure to apixaban. Use with caution or avoid. (Severe) Study
- HIV-protase inhibitors (ritonavir) are predicted to increase the exposure to apixaban. Avoid. (Severe) Theoretical
- Macrolides (clarithromycin) are predicted to increase the exposure to apixaban. Avoid. (Severe) Theoretical
- Macrolides (erythromycin) are predicted to increase the exposure to apixaban. (Moderate) Theoretical
- Pyrimethamine is predicted to moderately increase the exposure to apixaban. Use with caution or avoid. (Severe) Study
- St John’s Wort is predicted to decrease the exposure to apixaban. Use with caution or avoid. (Moderate) Theoretical
- Apomorphine  see dopamine receptor agonists
- Apraclonidine  see TABLE 6 p. 819 (bradycardia), TABLE 8 p. 819 (hypotension), TABLE 11 p. 820 (CNS depressant effects)
- Amfetamines are predicted to decrease the effects of apraclonidine. Avoid. (Severe) Theoretical
- METHYLPHENIDATE is predicted to decrease the effects of apraclonidine. Avoid. (Severe) Theoretical
- Sympathomimetics, inotropic are predicted to decrease the effects of apraclonidine. Avoid. (Severe) Theoretical
- Sympathomimetics, vasoconstrictor are predicted to decrease the effects of apraclonidine. Avoid. (Severe) Theoretical
- Aprepitant
  - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) moderately decrease the exposure to apremilast. Avoid. (Severe) Study
  - Enzelutamide moderately decreases the exposure to apremilast. Avoid. (Severe) Study
  - Rifampicin moderately decreases the exposure to apremilast. Avoid. (Severe) Study
  - St John’s Wort is predicted to decrease the exposure to apremilast. Avoid. (Severe) Theoretical
- Aprepitant increases the exposure to antiarrhythmics (dronedarone). (Severe) Theoretical
- Aprepitant is predicted to increase the exposure to antifungals, azoles (isavuconazole). (Moderate) Theoretical
- Aprepitant is predicted to increase the exposure to antifungals, azoles (itraconazole, ketocanazole, voriconazole) are predicted to markedly increase the exposure to aprepitant. (Moderate) Study
- Aprepitant is predicted to increase the exposure to bedaquiline. Avoid prolonged use. (Mild) Theoretical
- Afinitas is predicted to increase the exposure to bosutinib. Avoid or adjust bosutinib dose. (Severe) Theoretical
- Aprepitant is predicted to increase the exposure to buspirone. Use with caution and adjust dose. (Moderate) Study
- Aprepitant is predicted to increase the exposure to cabozantinib. (Moderate) Theoretical
- Calcium channel blockers (diltiazem) increase the exposure to aprepiant and aprepitant increases the exposure to calcium channel blockers (diltiazem). (Moderate) Study
- Calcium channel blockers (verapamil) are predicted to increase the exposure to aprepiant and aprepitant is predicted to increase the exposure to calcium channel blockers (verapamil). (Moderate) Theoretical
- Aprepitant is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. (Moderate) Study
- Aprepitant is predicted to increase the exposure to ceritinib. (Moderate) Theoretical
- Aprepitant increases the concentration of ciclosporin. (Severe) Study
- Aprepitant is predicted to markedly increase the exposure to cobimetinib. (Moderate) Study
- Aprepitant is predicted to increase the exposure to colchicine. Adjust colchicine dose. (Severe) Study
- Aprepitant is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, Interactions p. 474. (Severe) Study
- Aprepitant moderately increases the exposure to corticosteroids (dexamethasone). Monitor and adjust dose. (Moderate) Study
- Aprepitant is predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. (Moderate) Study
- Aprepitant decreases the anticoagulant effect of coumarins. (Moderate) Study
Aprepitant (continued)

- **Aprepitant** is predicted to increase the exposure to crizotinib. [Moderate] [Theoretical]
- **Aprepitant** is predicted to slightly increase the exposure to darifenacin. [Moderate] [Study]
- **Aprepitant** is predicted to increase the exposure to dasatinib. [Severe] [Study]
- **Aprepitant** is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] [Theoretical]
- **Aprepitant** increases the risk of QT-prolongation when given with domperidone. Avoid. [Severe] [Study]
- **Aprepitant** is predicted to increase the exposure to dopamine receptor agonists (bromocriptine, cabergoline). [Severe] [Theoretical]
- **Aprepitant** is predicted to moderately increase the exposure to dutasteride. [Mild] [Study]
- **Enzalutamide** is predicted to markedly decrease the exposure to aprepitant. Avoid. [Moderate] [Study]
- **Aprepitant** is predicted to increase the risk of ergotism when given with ergometrine. [Severe] [Theoretical]
- **Aprepitant** is predicted to increase the risk of ergotism when given with ergotamine. [Severe] [Theoretical]
- **Aprepitant** is predicted to increase the exposure to erlotinib. [Moderate] [Theoretical]
- **Aprepitant** is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] [Theoretical]
- **Aprepitant** is predicted to increase the concentration of everolimus. Avoid or adjust dose. [Moderate] [Study]
- **Aprepitant** is predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose in hepatic and renal impairment. [Mild] [Study]
- **Aprepitant** is predicted to increase the exposure to gefitinib. [Moderate] [Theoretical]
- **Aprepitant** is predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 222. [Moderate] [Theoretical]
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to markedly increase the exposure to aprepitant. Avoid. [Moderate] [Study]
- **Aprepitant** is predicted to decrease the effects of Hormone replacement therapy. [Moderate] [Anecdotal]
- **Aprepitant** is predicted to increase the exposure to ibrutinib. Avoid or adjust ibrutinib dose. [Severe] [Theoretical]
- **Idelalisib** is predicted to markedly increase the exposure to aprepitant. [Moderate] [Study]
- **Aprepitant** is predicted to increase the exposure to imatinib. [Moderate] [Theoretical]
- **Aprepitant** is predicted to increase the exposure to ivabradine. Adjust ivabradine dose. [Severe] [Theoretical]
- **Aprepitant** is predicted to increase the exposure to ivacaftor. Adjust ivacaftor dose, p. 179. [Severe] [Study]
- **Aprepitant** is predicted to increase the exposure to lapatinib. [Moderate] [Study]
- **Aprepitant** is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] [Theoretical]
- **Aprepitant** is predicted to increase the exposure to lomiptamide. Avoid. [Moderate] [Theoretical]
- **Aprepitant** is predicted to increase the exposure to lurasidone. [Moderate] [Study]
- Macrolides (clarithromycin) are predicted to markedly increase the exposure to aprepitant. [Moderate] [Study]
- **Aprepitant** is predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. [Severe] [Study]
- **Aprepitant** is predicted to increase the exposure to naloxegol. Adjust naloxegol dose and monitor side effects. [Moderate] [Study]
- **Aprepitant** is predicted to increase the exposure to nilotinib. [Moderate] [Theoretical]
- **Aprepitant** is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] [Anecdotal]
- **Aprepitant** is predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose. [Moderate] [Theoretical]
- **Aprepitant** is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. [Moderate] [Study]
- **Aprepitant** is predicted to increase the exposure to opioids (methadone, sufentanil). [Moderate] [Theoretical]
- **Aprepitant** is predicted to increase the exposure to oxbutynin. [Mild] [Theoretical]
- **Aprepitant** is predicted to increase the exposure to pazopanib. [Moderate] [Theoretical]
- **Aprepitant** is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafili). Adjust avanafili dose. [Moderate] [Theoretical]
- **Aprepitant** is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Monitor and adjust sildenafil dose, p. 117. [Moderate] [Study]
- **Aprepitant** is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). [Severe] [Theoretical]
- **Aprepitant** is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (vardenafil). Adjust dose. [Severe] [Theoretical]
- **Aprepitant** is predicted to increase the exposure to pimozide. Avoid. [Severe] [Theoretical]
- **Aprepitant** is predicted to increase the exposure to quetiapine. Avoid. [Moderate] [Study]
- **Aprepitant** is predicted to increase the exposure to ranolazine. [Severe] [Study]
- **Rifampicin** is predicted to markedly decrease the exposure to aprepitant. Avoid. [Moderate] [Study]
- **Aprepitant** is predicted to increase the exposure to ruxolitinib. [Moderate] [Theoretical]
- **Aprepitant** is predicted to increase the exposure to saxagliptin. [Mild] [Study]
- **Aprepitant** is predicted to increase the exposure to simprevir. Avoid. [Severe] [Study]
- **Aprepitant** increases the concentration of sirolimus. Monitor and adjust dose. [Moderate] [Study]
- **Aprepitant** is predicted to increase the exposure to SSRI (dapoxetine). Adjust dapoxetine dose. [Moderate] [Theoretical]
- **St John’s Wort** is predicted to decrease the exposure to aprepitant. Avoid. [Moderate] [Theoretical]
- **Aprepitant** is predicted to increase the exposure to statins (atorvastatin). Monitor and adjust dose. [Severe] [Theoretical]
- **Aprepitant** is predicted to increase the exposure to statins (simvastatin). Use with caution and adjust simvastatin dose, p. 130. [Severe] [Study]
- **Aprepitant** is predicted to increase the exposure to sunifatinib. [Moderate] [Theoretical]
- **Aprepitant** is predicted to increase the concentration of tacrolimus. [Severe] [Study]
- **Aprepitant** is predicted to increase the exposure to taxanes (cabazitaxel). [Moderate] [Theoretical]
- **Aprepitant** is predicted to increase the concentration of temsirolimus. [Moderate] [Theoretical]
- **Aprepitant** is predicted to increase the exposure to toloterodine. [Mild] [Theoretical]
- **Aprepitant** is predicted to increase the exposure to tolvaptan. Adjust dose. [Moderate] [Theoretical]
- **Aprepitant** is predicted to increase the exposure to trazodone. [Moderate] [Theoretical]
- **Aprepitant** decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] [Anecdotal]
- **Aprepitant** is predicted to increase the exposure to venlafaxine. Avoid or adjust venlafaxine dose. [Severe] [Study]
- **Aprepitant** is predicted to increase the exposure to vinca alkaloids. [Severe] [Theoretical]
- **Aprepitant** is predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] [Study]
- **Arigatoban** → see TABLE 3 p. 818 (anticoagulant effects)
- Ranibizumab is predicted to increase the risk of bleeding events when given with arigatoban. [Severe] [Theoretical]
- **Aripiprazole** → see TABLE 8 p. 819 (hypotension), TABLE 11 p. 820 (CNS depressant effects)
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease
the exposure to aripiprazole. Adjust aripiprazole dose, p. 240. [Moderate] Study ▶ Also see TABLE 11 p. 820

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to slightly increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 240. [Moderate] Study

Bupropion is predicted to moderately increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 240. [Moderate] Study

Cinacalcet is predicted to moderately increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 240. [Moderate] Study

Cobicistat is predicted to slightly increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 240. [Moderate] Study

Aripiprazole is predicted to decrease the effects of dopamine receptor agonists. [Moderate] Theoretical ▶ Also see TABLE 8 p. 819

Enalapril is predicted to moderately decrease the exposure to aripiprazole. Adjust aripiprazole dose, p. 240. [Moderate] Study

Terbinafine is predicted to markedly increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 240. [Moderate] Study

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to slightly increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 240. [Moderate] Study

Idelalisib is predicted to slightly increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 240. [Moderate] Study

Asparaginase is predicted to moderately decrease the exposure to aripiprazole. Adjust aripiprazole dose, p. 240. [Moderate] Study

SSRIs (fluoxetine, paroxetine) are predicted to moderately increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 240. [Moderate] Study

Terbinafine is predicted to moderately increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 240. [Moderate] Study

Arsenic trioxide ▶ see TABLE 15 p. 821 (myelosuppression). TABLE 9 p. 820 (QT-interval prolongation)

Artemether ▶ see antimalarials

Articaine ▶ see TABLE 11 p. 820 (CNS depressant effects)

Ascorbic acid

Ascorbic acid is predicted to increase the risk of cardiovascular side-effects when given with deferiprone. [Severe] Theoretical

Ascorbic acid is predicted to increase the risk of cardiovascular side-effects when given with iron chelators (desferrioxamine). [Severe] Theoretical

Asenapine ▶ see TABLE 8 p. 819 (hypotension). TABLE 11 p. 820 (CNS depressant effects)

Asenapine is predicted to decrease the effects of dopamine receptor agonists. Adjust dose. [Moderate] Theoretical ▶ Also see TABLE 8 p. 819

Asenapine is predicted to decrease the effects of levodopa. [Severe] Theoretical ▶ Also see TABLE 8 p. 819

SSRIs (fluvoxamine) increase the exposure to asenapine. [Moderate] Study

SSRIs (paroxetine) moderately increase the exposure to asenapine. [Moderate] Study

Asparaginase ▶ see TABLE 1 p. 818 (hepatotoxicity). TABLE 15 p. 821 (myelosuppression)

Asparaginase is predicted to increase the risk of hepatotoxicity when given with imatinib. [Severe] Theoretical ▶ Also see TABLE 15 p. 821

Asparaginase affects the efficacy of methotrexate. [Severe] Anecdotal ▶ Also see TABLE 1 p. 818 ▶ Also see TABLE 15 p. 821

Asparaginase potentially increases the risk of neurotoxicity when given with vinca alkaloids (vincristine). Vincristine should be taken 3 to 24 hours before asparaginase. [Severe] Anecdotal ▶ Also see TABLE 1 p. 818 ▶ Also see TABLE 15 p. 821

Aspirin ▶ see TABLE 4 p. 818 (antiplatelet effects)

Acetazolamide increases the risk of severe toxic reaction when given with aspirin (high-dose). [Severe] Study

Antacids decrease the absorption of aspirin (high-dose). [Moderate] Study

Aspirin (high-dose) is predicted to increase the risk of gastrointestinal irritation when given with bisphosphonates (alendronic acid, ibandronic acid). [Moderate] Study

Aripiprazole – Axitinib 851

Aspirin (high-dose) is predicted to increase the risk of renal impairment when given with bisphosphonates (sodium clodronate). [Severe] Theoretical

Corticosteroids are predicted to decrease the concentration of aspirin (high-dose) and aspirin (high-dose) increases the risk of gastrointestinal bleeding when given with corticosteroids. [Moderate] Study

Aspirin (high-dose) increases the risk of renal impairment when given with daptomycin. [Moderate] Theoretical

Erlotinib is predicted to increase the risk of gastrointestinal perforation when given with aspirin (high-dose). [Severe] Theoretical

Aspirin (high-dose) is predicted to increase the risk of gastrointestinal bleeds when given with iron chelators (deferasirox). [Severe] Theoretical

Aspirin (high-dose) is predicted to increase the risk of toxicity when given with methotrexate. [Severe] Theoretical

Aspirin is predicted to increase the risk of gastrointestinal perforation when given with nicorandil. [Severe] Theoretical

Aspirin (high-dose) potentially increases the exposure to pemetrexed. Use with caution or avoid. [Severe] Theoretical

Aspirin (high-dose) potentially increases the risk of seizures when given with quinolones. [Severe] Theoretical

Aspirin decreases the effects of sulfapyrazine. [Moderate] Study

Aspirin (high-dose) increases the risk of acute renal failure when given with thiazide diuretics. [Severe] Theoretical

Zidovudine increases the risk of haematological toxicity when given with aspirin (high-dose). [Severe] Study

Ataluren

Ataluren increases the exposure to adefovir. [Moderate] Study

Ataluren is predicted to increase the risk of nephrotoxicity when given with intravenous aminoglycosides. Avoid. [Severe] Study

Aripiprazol decreases the exposure to ataluren. [Moderate] Study

Atazanavir ▶ see HIV-protease inhibitors

Atelesol ▶ see beta blockers, selective

Atomoxetine

Amfetamines are predicted to increase the risk of side-effects when given with atomoxetine. [Severe] Theoretical

Atomoxetine is predicted to increase the risk of cardiovascular side-effects when given with beta2 agonists (high-dose). [Moderate] Study

Bupropion is predicted to markedly increase the exposure to atomoxetine. Adjust dose. [Severe] Study

Cinacalcet is predicted to markedly increase the exposure to atomoxetine. Adjust dose. [Severe] Study

Mononamine-oxidase A and B inhibitors, irreversible are predicted to increase the risk of side-effects when given with atomoxetine. Avoid and for 2 weeks after stopping the MAOI. [Severe] Theoretical

Panobinostat is predicted to increase the exposure to atomoxetine. Monitor and adjust dose. [Severe] Theoretical

SSRIs (fluoxetine, paroxetine) are predicted to markedly increase the exposure to atomoxetine. Adjust dose. [Severe] Study

Terbinafine is predicted to markedly increase the exposure to atomoxetine. Adjust dose. [Severe] Study

Axitinib is predicted to markedly increase the exposure to atomoxetine. Adjust dose. [Severe] Study

Atervastatin ▶ see statins

Ativacoume ▶ see antimalarials

Atraconium ▶ see neuromuscular blocking drugs, non-depolarising

Atropine ▶ see TABLE 10 p. 820 (antimuscarinics)

Atropine increases the risk of severe hypertension when given with sympathomimetics, vasoconstrictor (phenylephrine). [Severe] Study

Avalanif ▶ see phosphodiesterase type-5 inhibitors

Axitinib ▶ see TABLE 15 p. 821 (myelosuppression)

Antiarrhythmics (dronedarone) are predicted to increase the exposure to axitinib. [Moderate] Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to axitinib. Avoid or adjust dose. [Moderate] Study

Antifungals, azoles (flucanazole, isavuconazole, posaconazole) are predicted to increase the exposure to axitinib. [Moderate] Theoretical
Axitinib (continued)

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to axitinib. Avoid or adjust dose. [Moderate] Study
- Aprepitant is predicted to increase the exposure to axitinib. [Moderate] Theoretical
- Bosentan is predicted to decrease the exposure to axitinib. [Moderate] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to axitinib. [Moderate] Theoretical
- Cobicistat is predicted to increase the exposure to axitinib. Avoid or adjust dose. [Moderate] Study
- Axitinib is predicted to increase the risk of bleeding events when given with coumarins. [Severe] Theoretical
- Crizotinib is predicted to increase the exposure to axitinib. [Moderate] Theoretical
- Efavirenz is predicted to decrease the exposure to axitinib. [Moderate] Theoretical
- Enzalutamide is predicted to decrease the exposure to axitinib. Avoid or adjust dose. [Moderate] Study
- Grapefruit juice is predicted to increase the exposure to axitinib. [Moderate] Theoretical
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to axitinib. Avoid or adjust dose. [Moderate] Study
- HIV-protease inhibitors (indinavir) are predicted to increase the exposure to axitinib. [Moderate] Theoretical
- Idealisib is predicted to increase the exposure to axitinib. Avoid or adjust dose. [Moderate] Study → Also see TABLE 15 p. 821
- Imatinib is predicted to increase the exposure to axitinib. [Moderate] Theoretical
- Also see TABLE 15 p. 821
- Netupitant is predicted to increase the exposure to axitinib. [Moderate] Theoretical
- Nevirapine is predicted to decrease the exposure to axitinib. [Moderate] Theoretical
- Nilotinib is predicted to increase the exposure to axitinib. [Moderate] Theoretical
- Also see TABLE 15 p. 821
- Macrolides (clarithromycin) are predicted to increase the exposure to axitinib. Avoid or adjust dose. [Moderate] Study
- Macrolides (erythromycin) are predicted to increase the exposure to axitinib. [Moderate] Theoretical
- Netupitant is predicted to increase the exposure to axitinib. [Moderate] Theoretical
- Nevirapine is predicted to decrease the exposure to axitinib. [Moderate] Theoretical
- Axitinib is predicted to increase the exposure to axitinib. Avoid or adjust dose. [Moderate] Study
- Axitinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
- Rifampicin is predicted to decrease the exposure to axitinib. Avoid or adjust dose. [Moderate] Study
- St John’s Wort is predicted to decrease the exposure to axitinib. [Moderate] Theoretical
- Azacitidine → see TABLE 15 p. 821 (myelosuppression)
- Azathioprine → see TABLE 15 p. 821 (myelosuppression)
- ACE inhibitors are predicted to increase the risk of anaemia and/or leucopenia when given with azathioprine. [Severe] Aneodotal
- Allipurinol potentially increases the risk of haematological toxicity when given with azathioprine. Adjust azathioprine dose, p. 495. [Severe] Study
- Azathiprine decreases the anticoagulant effect of coumarins. [Moderate] Study
- Febuxostat is predicted to increase the exposure to azathioprine. Avoid. [Severe] Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with azathioprine. Public Health England advises avoid. [Severe] Theoretical
- Azelastine → see antihistamines, non-sedating
- Azilsartan → see angiotensin-II receptor antagonists
- Azithromycin → see macrolides
- Bacillus Calmette-Guérin vaccine → see live vaccines
- Bactracin → see TABLE 2 p. 818 (nephrotoxicity)
- Baflofen → see TABLE 8 p. 819 (nausea, vomiting), TABLE 11 p. 820 (CNS depressant effects), TABLE 10 p. 820 (antimuscarinics)
- Baflofen is predicted to increase the risk of side-effects when given with levodopa. [Severe] Aneodotal → Also see TABLE 8 p. 819
- Balsalazide → see TABLE 15 p. 821 (myelosuppression)
- Balsalazide is predicted to decrease the concentration of digoxin. [Moderate] Theoretical
- Bambuterol → see beta, agonists
- Basiliximab → see monoclonal antibodies
- Bazedoxifene
  - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to bazedoxifene. [Moderate] Theoretical
  - Rifampicin is predicted to decrease the exposure to bazedoxifene. [Moderate] Theoretical
- Beclometasone → see corticosteroids
- Bedaquiline → see TABLE 9 p. 820 (QT-interval prolongation)
- Antarrhythmics (dronedarone) are predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical
- Aprepitant is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical
- Nevirapine, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical
- Aprepitant is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical
- Bosentan is predicted to decrease the exposure to bedaquiline. Avoid. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical
- Aprepitant is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical
- Bosentan is predicted to decrease the exposure to bedaquiline. Avoid. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical
- Clofazime potentially increases the risk of QT-prolongation when given with bedaquiline. [Severe] Study
- Cobicistat is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Study
- Crizotinib is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Study → Also see TABLE 9 p. 820
- Aprepitant is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical
- Balsalazide decreases the exposure to bedaquiline. Avoid. [Severe] Study
- Etravirine is predicted to decrease the exposure to bedaquiline. Avoid. [Severe] Theoretical
- Macrolides (clarithromycin) are predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical
- Aprepitant is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical
- Nevirapine is predicted to decrease the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical
- Macrolides (erythromycin) are predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Study → Also see TABLE 9 p. 820
- Aprepitant is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical
- Bosentan is predicted to decrease the exposure to bedaquiline. Avoid. [Severe] Study
- St John’s Wort is predicted to decrease the exposure to bedaquiline. Avoid. [Severe] Study
- Bee venom extract

GENERAL INFORMATION

Desensitising vaccines should be avoided in patients taking beta-blockers (adrenaline might be ineffective in case of a hypersensitivity reaction) or ACE inhibitors (risk of severe anaphylactoid reactions).

- ACE inhibitors increase the risk of hypersensitivity when given with bee venom extract. Avoid. [Severe] Study
Belatacept

- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with belatacept. Public Health England advises avoid. Severe
- Theoretical

Belimumab → see monoclonal antibodies

Bendamustine → see alkylating agents

Bendrofluiamethiazide → see thiazide diuretics

Benperidol → see TABLE 8 p. 819 (hypotension), TABLE 11 p. 820 (CNS depressant effects)

- Benperidol is predicted to decrease the effects of dopamine receptor agonists. Avoid. Moderate Theoretical → Also see TABLE 8 p. 819
- Benperidol is predicted to decrease the effects of guanethidine. Moderate Theoretical → Also see TABLE 8 p. 819
- Benperidol is predicted to decrease the effects of levodopa. Severe Study → Also see TABLE 8 p. 819

Benzodiazepines → see benzodiazepines

Benzylpenicillin → see penicillins

Beta blockers, non-selective → see TABLE 6 p. 819 (bradycardia), TABLE 8 p. 819 (hypotension), TABLE 9 p. 820 (QT-interval prolongation)

carbofylol · carvedilol · labetalol · levobunolol · nadolol · oxprenolol · pindolol · propranolol · sotalol · timolol

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application of carbofelol, levobunolol, and timolol the possibility of interactions should be borne in mind.

- Abiraterone is predicted to increase the exposure to beta blockers, non-selective (carvedilol, timolol). Moderate Theoretical
- Beta blockers, non-selective are predicted to increase the risk of bronchospasm when given with aminophylline. Avoid. Severe Theoretical
- Antiarrhythmics (amiodarone, disopyramide, dronedarone, flecainide, lidocaine) are predicted to increase the risk of cardiovascular side-effects when given with beta blockers, non-selective. Use with caution or avoid. Severe Study → Also see TABLE 6 p. 819 → Also see TABLE 9 p. 820
- Antiarrhythmics (propafenone) are predicted to increase the exposure to carvedilol. Moderate Theoretical
- Antiarrhythmics (propafenone) are predicted to increase the risk of cardiovascular side-effects when given with propranolol. Use with caution or avoid. Severe Study
- Antiarrhythmics (propafenone) are predicted to increase the exposure to timolol and timolol is predicted to increase the risk of cardiodepression when given with antiarrhythmics (propafenone). Severe Anecdotal
- Antiarrhythmics (propafenone) are predicted to increase the risk of cardiovascular side-effects when given with beta blockers, non-selective (carbofelol, labetalol, levobunolol, nadolol, oxprenolol, pindolol, sotalol). Use with caution or avoid. Severe Study
- Anticholinesterases, centrally acting are predicted to increase the risk of bradycardia when given with beta blockers, non-selective. Moderate Anecdotal → Also see TABLE 6 p. 819
- Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to propranolol. Moderate Study
- Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to beta blockers, non-selective (carvedilol, labetalol). Moderate Theoretical
- Antifunguals, azoles (itraconazole, ketoconazole) are predicted to increase the exposure to nadolol. Moderate Study
- Antimalarials (mefloquine) are predicted to increase the risk of bradycardia when given with beta blockers, non-selective. Severe Theoretical
- Bupropion is predicted to increase the exposure to beta blockers, non-selective (carvedilol, timolol). Moderate Study
- Calcium channel blockers (diltiazem) are predicted to increase the risk of cardiodepression when given with beta blockers, non-selective. Severe Study → Also see TABLE 6 p. 819 → Also see TABLE 8 p. 819
- Intravenous calcium channel blockers (verapamil) increase the risk of cardiovascular side-effects when given with beta blockers, non-selective. Avoid. Severe Study → Also see TABLE 6 p. 819
- Oral calcium channel blockers (verapamil) increase the risk of cardiovascular side-effects when given with beta blockers, non-selective. Severe Study → Also see TABLE 6 p. 819 → Also see TABLE 8 p. 819
- Ciclosporin is predicted to increase the exposure to nadolol. Moderate Theoretical
- Cinacalcet is predicted to increase the exposure to beta blockers, non-selective (carvedilol, timolol). Moderate Study
- Duloxetine is predicted to increase the exposure to beta blockers, non-selective (carvedilol, timolol). Moderate Theoretical
- Beta blockers, non-selective are predicted to increase the risk of peripheral vasconstriction when given with ergotamine. Severe Theoretical
- Beta blockers, non-selective are predicted to increase the risk of peripheral vasconstriction when given with ergotamine. Severe Study
- HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the exposure to nadolol. Moderate Study
- HIV-protease inhibitors (ritonavir) are predicted to increase the exposure to carvedilol. Moderate Theoretical
- HIV-protease inhibitors (ritonavir) (high-dose) are predicted to increase the exposure to timolol. Moderate Theoretical
- Beta blockers, non-selective are predicted to increase the risk of bradycardia when given with lanreotide. Moderate Theoretical
- Lapatinib is predicted to increase the exposure to nadolol. Moderate Study
- Macrolides are predicted to increase the exposure to nadolol. Moderate Study
- Mirabegron is predicted to increase the exposure to beta blockers, non-selective (carvedilol, timolol). Moderate Theoretical
- Ranolazine is predicted to increase the exposure to nadolol. Moderate Study
- Rifampicin moderately decreases the exposure to carvedilol. Moderate Study
- Rifampicin decreases the exposure to propranolol. Monitor and adjust propranolol dose, p. 101. Moderate Study
- Propranolol slightly to moderately increases the exposure to rizatRIPTAN. Adjust rizatRIPTAN dose and separate administration by at least 2 hours. Moderate Study
- SSRIs (fluvoxamine) moderately increase the concentration of propranolol. Moderate Study
- SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to beta blockers, non-selective (carvedilol, timolol). Moderate Study
- Beta blockers, non-selective increase the risk of hypertension and bradycardia when given with sympathomimetics, inotropic (dobutamine). Severe Theoretical
- Beta blockers, non-selective are predicted to increase the risk of hypertension and bradycardia when given with sympathomimetics, vasocostructor (adrenaline/Epinephrine, noradrenaline/norepinephrine). Severe Study
- Terbinafine is predicted to increase the exposure to beta blockers, non-selective (carvedilol, timolol). Moderate Study
- Beta blockers, non-selective are predicted to increase the risk of bronchospasm when given with theophylline. Avoid. Severe Theoretical
- Vemurafenib is predicted to increase the exposure to nadolol. Moderate Study

Beta blockers, selective → see TABLE 6 p. 819 (bradycardia), TABLE 8 p. 819 (hypotension)

acebutolol · atenolol · betaxolol · bisoprolol · celiprolol · esmolol · metoprolol · nebivolol

- Since systemic absorption can follow topical application of betaxolol, the possibility of interactions should be borne in mind.
- Orange juice greatly decreases the exposure to celiprolol.

- Abiraterone is predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). Moderate Study
- Beta blockers, selective are predicted to increase the risk of bronchospasm when given with aminophylline. Avoid. Severe Theoretical
- Antiarrhythmics (amiodarone, disopyramide, dronedarone, flecainide, lidocaine) are predicted to increase the risk of cardiovascular side-effects when given with beta blockers,
Beta blockers, selective (continued)

selective. Use with caution or avoid. (Severe) Study → Also see TABLE 6 p. 819

- Antiarrhythmics (propafenone) are predicted to increase the exposure to metoprolol. (Moderate) Study
- Antiarrhythmics (propafenone) are predicted to increase the exposure to nebivolol and nebivolol is predicted to increase the risk of bradycardia when given with antiarrhythmics (propafenone). Avoid. (Severe) Theoretical
- Antiarrhythmics (propafenone) are predicted to increase the risk of cardiovascular side-effects when given with beta blockers, selective (acebutolol, atenolol, betaxolol, bisoprolol, celiprolol, esmolol). Use with caution or avoid. (Severe) Study
- Anticholinesterases, centrally acting are predicted to increase the risk of bradycardia when given with beta blockers, selective. (Moderate) Anecdotal → Also see TABLE 6 p. 819
- Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to beta blockers, selective (acebutolol, bisoprolol, metoprolol, nebivolol). (Moderate) Study
- Antimalarials (mefloquine) are predicted to increase the risk of bradycardia when given with beta blockers, selective. (Severe) Theoretical
- Bupropion is predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). (Moderate) Study
- Calcium channel blockers (diltiazem) are predicted to increase the risk of cardiacdepression when given with beta blockers, selective. (Severe) Study → Also see TABLE 6 p. 819 → Also see TABLE 8 p. 819
- Intravenous calcium channel blockers (verapamil) increase the risk of cardiovascular side-effects when given with beta blockers, selective. Avoid. (Severe) Study → Also see TABLE 6 p. 819 → Also see TABLE 8 p. 819
- Oral calcium channel blockers (verapamil) increase the risk of cardiovascular side-effects when given with beta blockers, selective. (Severe) Study → Also see TABLE 6 p. 819 → Also see TABLE 8 p. 819
- Cinacalcet is predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). (Moderate) Study
- Duloxetine is predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). (Moderate) Study
- Beta blockers, selective are predicted to increase the risk of peripheral vasoconstriction when given with ergometrine. (Severe) Study
- Beta blockers, selective are predicted to increase the risk of peripheral vasoconstriction when given with ergotamine. (Severe) Study
- Grapefruit juice greatly decreases the exposure to ciloprolol. (Moderate) Study
- HIV-protease inhibitors (ritonavir) are predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). (Moderate) Study
- Beta blockers, selective are predicted to increase the risk of bradycardia when given with lanreotide. (Moderate) Theoretical
- Mirabegron is predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). (Moderate) Study
- Panobinostat is predicted to increase the exposure to metoprolol. Monitor and adjust dose. (Moderate) Theoretical
- Rifampicin slightly decreases the exposure to beta blockers, selective (bisoprolol, metoprolol). (Mild) Study
- Rifampicin moderately decreases the exposure to ciloprolol. (Moderate) Study
- SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). (Moderate) Study
- Beta blockers, selective increase the risk of hypertension and bradycardia when given with sympathomimetics, inotropic (dobutamine). (Moderate) Theoretical
- Beta blockers, selective are predicted to increase the risk of hypertension and bradycardia when given with sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine). (Severe) Study
- Terbinafine is predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). (Moderate) Study
- Beta blockers, selective are predicted to increase the risk of bronchospasms when given with theophylline. Avoid. (Severe) Theoretical
- Beta, agonists → see TABLE 17 p. 822 (reduced serum potassium)
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to salmeterol. Avoid. (Severe) Study
- Atomoxetine is predicted to increase the risk of cardiovascular side-effects when given with beta, agonists (high-dose). (Moderate) Study
- Cobicistat is predicted to increase the exposure to salmeterol. Avoid. (Severe) Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to salmeterol. Avoid. (Severe) Study
- Idelalisib is predicted to increase the exposure to salmeterol. Avoid. (Severe) Study
- Beta, agonists are predicted to increase the risk of glaucoma when given with ipratropium. (Moderate) Anecdotal
- Beta, agonists are predicted to increase the risk of elevated blood pressure when given with linezolid. Avoid. (Severe) Theoretical
- Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the risk of cardiovascular side-effects when given with beta, agonists. (Moderate) Anecdotal
- Monoamine-oxidase B inhibitors (rasagiline, selegiline) are predicted to increase the risk of severe hypertension when given with beta, agonists. Avoid. (Severe) Theoretical
- Monoamine-oxidase B inhibitors (safinamide) are predicted to increase the risk of severe hypertension when given with beta, agonists. (Severe) Theoretical
- Betahistine → see corticosteroids Betaxolol → see beta blockers, selective
- Bevacizumab → see monoclonal antibodies
- Bexarotene → see retinoids
- Bezafibrate → see fibrates
- Bicalutamide → Bicalutamide is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical
- Bilastine → see antihistamines, non-sedating
- Bimatoprost aspar → see insulins
- Bimatoprost isopropyl → see insulins
- Bimatoprost → see beta blockers, selective
- Bisphosphonates → see TABLE 2 p. 818 (nephrotoxicity)
- Alendronate → see bisphosphonates. (Moderate) Anecdotal → Also see TABLE 2 p. 818
- Antacids decrease the absorption of alendronate. Alendronate acid should be taken at least 30 minutes before antacids. (Moderate) Study
- Antacids are predicted to decrease the absorption of ibandronate. Avoid antacids for at least 6 hours before or 1 hour after ibandronate. (Moderate) Theoretical
- Antacids decrease the absorption of risendronate. Separate administration by at least 2 hours. (Moderate) Study
- Antacids decrease the absorption of sodium clodronate. Avoid antacids for 2 hours before or 1 hour after sodium clodronate. (Moderate) Study
- Aminoglycosides increase the risk of hypocalcaemia when given with bisphosphonates. (Moderate) Anecdotal
Aspirin (high-dose) is predicted to decrease the risk of gastrointestinal irritation when given with bisphosphonates (alendronic acid, ibandronic acid). [Moderate] Study

Aspirin (high-dose) is predicted to increase the risk of renal impairment when given with sodium clodronate. [Severe] Theoretical

Oral calcium salts decrease the absorption of alendronic acid. Alendronic acid should be taken at least 30 minutes before calcium salts. [Moderate] Study

Oral calcium salts are predicted to decrease the absorption of oral ibandronic acid. Avoid calcium salts for at least 6 hours before or 1 hour after ibandronic acid. [Moderate] Theoretical

Oral calcium salts decrease the absorption of risendronate. Separate administration by at least 2 hours. [Moderate] Study

Oral calcium salts decrease the absorption of sodium clodronate. Avoid calcium salts for 2 hours before or 1 hour after sodium clodronate. [Moderate] Study

Iron (oral) is predicted to decrease the absorption of oral ibandronic acid. Avoid iron (oral) for at least 6 hours before or 1 hour after ibandronic acid. [Moderate] Theoretical

Iron (oral) decreases the absorption of risendronate. Separate administration by at least 2 hours. [Moderate] Study

Iron (oral) decreases the absorption of sodium clodronate. Avoid iron (oral) for 2 hours before or 1 hour after sodium clodronate. [Moderate] Study

Bisphosphonates are predicted to increase the risk of gastrointestinal bleeding when given with iron chelators (deferasirox). [Severe] Theoretical

Oral magnesium is predicted to decrease the absorption of alendronic acid. Alendronic acid should be taken at least 30 minutes before magnesium. [Moderate] Study

Oral magnesium is predicted to decrease the absorption of oral ibandronic acid. Avoid magnesium for at least 6 hours before or 1 hour after ibandronic acid. [Moderate] Study

Oral magnesium decreases the absorption of risendronate. Separate administration by at least 2 hours. [Moderate] Study

Oral magnesium decreases the absorption of sodium clodronate. Avoid magnesium for 2 hours before or 1 hour after sodium clodronate. [Moderate] Study

NSAIDs are predicted to increase the risk of gastrointestinal irritation when given with bisphosphonates (alendronic acid, ibandronic acid). [Moderate] Study

Oral zinc decreases the absorption of oral alendronic acid. Zinc should be taken at least 30 minutes before alendronic acid. [Moderate] Study

Oral zinc is predicted to decrease the absorption of oral ibandronic acid. Avoid zinc for at least 6 hours before or 1 hour after ibandronic acid. [Moderate] Theoretical

Oral zinc decreases the absorption of oral risendronate. Separate administration by at least 2 hours. [Moderate] Study

Oral zinc decreases the absorption of oral sodium clodronate. Avoid zinc for 2 hours before or 1 hour after sodium clodronate. [Moderate] Study

Bivalirudin → see TABLE 3 p. 818 (anticoagulant effects)

Ranibizumab is predicted to increase the risk of bleeding events when given with bivalirudin. [Moderate] Theoretical

Bleomycin → see TABLE 15 p. 821 (myelosuppression), TABLE 5 p. 818 (thromboembolism)

Bleomycin is predicted to increase the risk of generalised infection (possibly life-threatening) when given with bleomycin. Public Health England advises avoid. [Severe] Theoretical

Monoclonal antibodies (brentuximab vedotin) increase the risk of pulmonary toxicity when given with bleomycin. Avoid. [Severe] Study → Also see TABLE 15 p. 821

Platinum compounds (cisplatin) increase the risk of pulmonary toxicity when given with bleomycin. [Severe] Study → Also see TABLE 15 p. 821

Blinatumomab → see monoclonal antibodies

Bortezomib → see TABLE 8 p. 819 (hypotension), TABLE 15 p. 821 (myelosuppression), TABLE 12 p. 821 (peripheral neuropathy)

Anti-epileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) slightly decrease the exposure to bortezomib. Avoid. [Severe] Study → Also see TABLE 12 p. 821

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) slightly increase the exposure to bortezomib. [Moderate] Study

Cobicistat slightly increases the exposure to bortezomib. [Moderate] Study

Enzalutamide slightly decreases the exposure to bortezomib. Avoid. [Severe] Study

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) slightly increase the exposure to bortezomib. [Moderate] Study

Idealisib slightly increases the exposure to bortezomib. [Moderate] Study → Also see TABLE 15 p. 821

Macrolides (clarithromycin) slightly increase the exposure to bortezomib. [Moderate] Study

Rifampicin slightly decreases the exposure to bortezomib. Avoid. [Severe] Study

Bosentan

Bosentan is predicted to decrease the exposure to antiarrhythmics (dronedarone). [Severe] Theoretical

Anti-epileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) affect the exposure to bosentan. Avoid. [Severe] Study

Antifungals, azoles (fluconazole) are predicted to increase the exposure to bosentan. Avoid. [Severe] Study

Antifungals, azoles (itraconazole) are predicted to increase the exposure to bosentan. [Moderate] Theoretical

Antifungals, azoles (ketoconazole) moderately increase the exposure to bosentan. [Moderate] Study

Antifungals, azoles (voriconazole) are predicted to increase the exposure to bosentan. Avoid. [Severe] Study

Bosentan is predicted to decrease the exposure to bedaquiline. Avoid. [Severe] Study

Bosentan is predicted to decrease the exposure to bosutinib. Avoid. [Severe] Theoretical

Bosentan is predicted to decrease the exposure to cabozantinib. [Moderate] Theoretical

Bosentan is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Theoretical

Bosentan is predicted to decrease the exposure to calcium channel blockers (diltiazem, verapamil). [Moderate] Theoretical

Cephalosporins (ceftepime) are predicted to increase the exposure to bosentan. [Moderate] Theoretical

Bosentan moderately decreases the exposure to ciclosporin and moderately increases the exposure to bosentan. Avoid. [Severe] Study

Bosentan is predicted to decrease the exposure to cobicistat. Avoid. [Severe] Theoretical

Bosentan is predicted to decrease the exposure to cobimetinib. Avoid. [Severe] Theoretical

Bosentan is predicted to decrease the efficacy of combined hormonal contraceptive. [Severe] Study

Bosentan decreases the anticoagulant effect of coumarins. [Moderate] Study

Bosentan is predicted to decrease the exposure to crizotinib. Avoid. [Severe] Theoretical

Bosentan is predicted to decrease the exposure to daclatasvir. Adjust daclatasvir dose. [Moderate] Theoretical

Bosentan is predicted to decrease the exposure to dasatinib. [Severe] Study

Bosentan is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Study

Bosentan decreases the exposure to duloxetine. Adjust dose. [Severe] Study

Bosentan is predicted to moderately decrease the exposure to elbasvir. Avoid. [Severe] Study
Bosentan (continued)

- Bosentan is predicted to decrease the concentration of elvitegravir. Avoid. [Severe] Theoretical
- Enzalutamide affects the exposure to bosentan. Avoid. [Severe] Severe
- Bosentan is predicted to decrease the effects of ergotamine. [Moderate] Theoretical
- Bosentan is predicted to decrease the exposure to erlotinib. [Severe] Theoretical
- Bosentan is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical
- Bosentan is predicted to decrease the exposure to etravirine. Avoid. [Severe] Study
- Bosentan is predicted to decrease the concentration of everolimus. Avoid or adjust dose. [Severe] Study
- Bosentan is predicted to decrease the exposure to gefitinib. Avoid. [Severe] Theoretical
- Bosentan is predicted to markedly decrease the exposure to grazoprevir. Avoid. [Severe] Study
- Bosentan is predicted to decrease the concentration of guanfacine. Adjust dose. [Moderate] Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to bosentan. [Severe] Study
- Bosentan is predicted to decrease the effects of Hormone replacement therapy. [Moderate] Anecdotal
- Bosentan is predicted to decrease the exposure to imatinib. [Moderate] Study
- Bosentan is predicted to decrease the exposure to lapatinib. Avoid. [Severe] Study
- Bosentan is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical
- Bosentan is predicted to decrease the exposure to lurasidone. Monitor and adjusting dose. [Moderate] Theoretical
- Macrolides (clarithromycin) are predicted to increase the exposure to bosentan. [Moderate] Theoretical
- Bosentan is predicted to decrease the exposure to maraviroc. Avoid. [Moderate] Theoretical
- Bosentan is predicted to decrease the concentration of midazolam. Monitor and adjust dose. [Moderate] Theoretical
- Bosentan is predicted to decrease the concentration of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Anecdotal
- Bosentan is predicted to decrease the exposure to olaparib. Avoid. [Moderate] Theoretical
- Bosentan decreases the exposure to opioids (methadone). Monitor and adjust dose. [Severe] Study
- Bosentan is predicted to decrease the exposure to osimertinib. [Moderate] Theoretical
- Bosentan is predicted to decrease the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. [Severe] Study
- Bosentan decreases the exposure to phosphodiesterase type-5 inhibitors. [Moderate] Study
- Rifampicin affects the exposure to bosentan. Avoid. [Severe] Study
- Bosentan is predicted to decrease the exposure to rilpivirine. Avoid. [Severe] Theoretical
- Bosentan is predicted to decrease the exposure to ruxolitinib. Monitor and adjust dose. [Moderate] Theoretical
- Bosentan is predicted to decrease the exposure to simeprevir. Avoid. [Severe] Study
- Bosentan is predicted to decrease the concentration of sirolimus and sirolimus potentially increases the concentration of bosentan. Avoid. [Severe] Theoretical
- St John's Wort is predicted to decrease the exposure to bosentan. Avoid. [Moderate] Theoretical
- Bosentan slightly decreases the exposure to statins (atorvastatin). [Mild] Study
- Bosentan moderately decreases the exposure to statins (simvastatin). [Moderate] Study
- Bosentan increases the risk of hepatotoxicity when given with sulfonylureas (glibenclamide). Avoid. [Severe] Study
- Bosentan is predicted to decrease the concentration of tacrolimus and tacrolimus potentially increases the concentration of bosentan. Avoid. [Severe] Theoretical
- Bosentan is predicted to decrease the exposure to taxanes (cabazitaxel). Avoid. [Severe] Study
- Bosentan is predicted to decrease the concentration of temsirolimus. Avoid. [Severe] Theoretical
- Bosentan is predicted to decrease the exposure to ticagrelor. [Moderate] Theoretical
- Bosentan is predicted to decrease the exposure to tolvaptan. [Moderate] Theoretical
- Bosentan decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Anecdotal
- Bosentan is predicted to decrease the exposure to velpatasvir. Avoid. [Moderate] Theoretical
- Bosutinib → see TABLE 15 p. 821 (myelosuppression), TABLE 9 p. 820 (QT-interval prolongation)
- Antacids are predicted to decrease the absorption of bosutinib. Bosutinib should be taken at least 12 hours before antacids.
- Bosutinib is predicted to increase the exposure to bosutinib. Avoid or adjust bosutinib dose. [Severe] Theoretical
- Amodiaquine (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to very markedly decrease the exposure to bosutinib. Avoid. [Severe] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to bosutinib. Avoid or adjust bosutinib dose. [Severe] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to bosutinib. Avoid or adjust bosutinib dose. [Severe] Study → Also see TABLE 9 p. 820
- Aprapitent is predicted to increase the exposure to bosutinib. Avoid or adjust bosutinib dose. [Severe] Theoretical
- Bosentan is predicted to decrease the exposure to bosutinib. Avoid. [Severe] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to bosutinib. Avoid or adjust bosutinib dose. [Severe] Theoretical
- Cobicistat is predicted to markedly increase the exposure to bosutinib. Avoid or adjust bosutinib dose. [Severe] Study
- Bosutinib is predicted to increase the risk of bleeding events when given with coumarins. [Severe] Theoretical
- Crizotinib is predicted to increase the exposure to bosutinib. Avoid or adjust bosutinib dose. [Severe] Theoretical → Also see TABLE 15 p. 821 → Also see TABLE 9 p. 820
- Efavirenz is predicted to decrease the exposure to bosutinib. Avoid. [Severe] Theoretical
- Enzalutamide is predicted to very markedly decrease the exposure to bosutinib. Avoid. [Severe] Study
- Etravirine is predicted to decrease the exposure to bosutinib. Avoid. [Severe] Theoretical
- Fosaprepitant is predicted to increase the exposure to bosutinib. [Severe] Theoretical
- Grapefruit juice is predicted to increase the exposure to bosutinib. Avoid. [Moderate] Theoretical
- H₂ receptor antagonists are predicted to decrease the absorption of bosutinib. [Moderate] Theoretical
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to markedly increase the exposure to bosutinib. Avoid or adjust bosutinib dose. [Severe] Study → Also see TABLE 9 p. 820
- HIV-protease inhibitors (indinavir) are predicted to increase the exposure to bosutinib. Avoid or adjust bosutinib dose. [Severe] Theoretical
- Idelalisib is predicted to markedly increase the exposure to bosutinib. Avoid or adjust bosutinib dose. [Severe] Study → Also see TABLE 15 p. 821
- Imatinib is predicted to increase the exposure to bosutinib. Avoid or adjust bosutinib dose. [Severe] Theoretical → Also see TABLE 15 p. 821
- Macrolides (clarithromycin) are predicted to markedly increase the exposure to bosutinib. Avoid or adjust bosutinib dose. (Severe) Study → Also see TABLE 9 p. 820
- Macrolides (erythromycin) are predicted to increase the exposure to bosutinib. Avoid or adjust bosutinib dose. (Severe) Theoretical
- Modafinil is predicted to decrease the exposure to bosutinib. Avoid. (Severe) Theoretical
- Netupitant is predicted to increase the exposure to bosutinib. Avoid or adjust bosutinib dose. (Severe) Theoretical
- Nevirapine is predicted to increase the exposure to bosutinib. Avoid or adjust bosutinib dose. (Severe) Theoretical
- Nilotinib is predicted to increase the exposure to bosutinib. Avoid or adjust bosutinib dose. (Severe) Theoretical
- Bosutinib is predicted to increase the risk of bleeding events when given with phenindione. (Severe) Theoretical
- Pitolisant is predicted to decrease the exposure to bosutinib. Avoid. (Severe) Theoretical
- Proton pump inhibitors are predicted to decrease the absorption of bosutinib. (Moderate) Study
- Rifampicin is predicted to very markedly decrease the exposure to bosutinib. Avoid. (Severe) Study
- St John’s Wort is predicted to decrease the exposure to bosutinib. Avoid. (Severe) Study
- Table 13 p. 821 → Also see TABLE 9 p. 820
- Bosutinib is predicted to increase the risk of bleeding events when given with phenindione. (Severe) Theoretical
- Pitolisant is predicted to decrease the exposure to bosutinib. Avoid. (Severe) Theoretical
- Brontoximab vedotin → see monoclonal antibodies
- Brinudimidine → see TABLE 6 p. 819 (bradycardia), TABLE 8 p. 819 (hypotension), TABLE 11 p. 820 (CNS depressant effects)
- Brinzolamide

**Bowel cleansing preparations**

**Separation of administration** Other oral drugs should not be taken 1 hour before, or after, administration of bowel cleansing preparations because absorption may be impaired. Consider withholding ACE inhibitors, angiotensin-II receptor antagonists, and NSAIDs on the day that bowel cleaning preparations are given and for up to 72 hours after the procedure. Also consider withholding diuretics on the day that bowel cleaning preparations are given.

- Bupropion is predicted to increase the exposure to beta blockers, non-selective (carvedilol, timolol). (Moderate) Study
- Bupropion is predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). (Moderate) Study
- Bupropion is predicted to slightly increase the exposure to darifenacin. (Mild) Study
- Bupropion increases the risk of side-effects when given with dopamine receptor agonists (amantadine). (Moderate) Study
- Efavirenz moderately decreases the exposure to bupropion. (Moderate) Study
- Enzalutamide is predicted to markedly decrease the exposure to bupropion. Adjust dose. (Moderate) Theoretical
- Methyldopa is predicted to increase the risk of severe hypertension when given with bupropion. Avoid. (Severe) Theoretical → Also see TABLE 13 p. 821
- Moclobemide is predicted to increase the risk of severe hypertension when given with bupropion. Avoid. (Severe) Theoretical → Also see TABLE 13 p. 821
- Bosutinib is predicted to slightly increase the exposure to monoamine-oxidase B inhibitors (codeine). (Mild) Theoretical
- Bosutinib is predicted to increase the exposure to opioids (tramadol). (Severe) Study → Also see TABLE 13 p. 821
- Bosutinib is predicted to moderately increase the exposure to pitolisant. Use with caution and adjust dose. (Moderate) Study
- Rifampicin is predicted to markedly decrease the exposure to bupropion. (Severe) Study
- Bosutinib is predicted to increase the exposure to risperidone. Adjust dose. (Moderate) Study
- Bupropion is predicted to increase the exposure to SSRIs (dapoxetine). (Moderate) Theoretical → Also see TABLE 13 p. 821
- Bupropion is predicted to decrease the efficacy of tamoxifen. Avoid. (Severe) Study
- Bosutinib is predicted to increase the exposure to tricyclic antidepressants. Monitor for toxicity and adjust dose. (Severe) Study → Also see TABLE 13 p. 821
- Bosutinib is predicted to increase the exposure to vortioxetine. Monitor and adjust dose. (Moderate) Study → Also see TABLE 13 p. 821
- Bupropion → see TABLE 13 p. 821 (serotonin syndrome)
- Antiarhythmics (dronedarone) are predicted to increase the exposure to bupropion. Use with caution and adjust dose. (Moderate) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly increase the exposure to bupropion. Use with caution and adjust dose. (Severe) Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to bupropion. Use with caution and adjust dose. (Moderate) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of bupropion. Use with caution and adjust dose. (Moderate) Theoretical
- Aprepitant is predicted to increase the exposure to bupropion. Use with caution and adjust dose. (Moderate) Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to bupropion. Use with caution and adjust dose. (Moderate) Study
Buspirone (continued)

- **Cobicistat** is predicted to increase the exposure to buspirone. Adjust buspirone dose. [Severe] Study
- **Crizotinib** is predicted to increase the exposure to buspirone. Use with caution and adjust dose. [Moderate] Study
- **Enzalutamide** is predicted to decrease the exposure to buspirone. Use with caution and adjust dose. [Severe] Study
- **Grapefruit juice** increases the exposure to buspirone. Avoid. [Mild] Study
- **HIV-protease inhibitors** (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to buspirone. Adjust buspirone dose. [Severe] Study
- **HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to buspirone. Use with caution and adjust dose. [Moderate] Study
- **Idelalisib** is predicted to increase the exposure to buspirone. Adjust buspirone dose. [Severe] Study
- **Imatinib** is predicted to increase the exposure to buspirone. Use with caution and adjust dose. [Moderate] Study
- **Buspirone** is predicted to increase the risk of elevated blood pressure when given with linezolid. Avoid. [Severe] Anecdotal → Also see TABLE 13 p. 821
- **Macrolides (clarithromycin)** are predicted to increase the exposure to buspirone. Adjust buspirone dose. [Severe] Study
- **Macrolides (erythromycin)** are predicted to increase the exposure to buspirone. Use with caution and adjust dose. [Moderate] Study
- **Rifampicin** is predicted to increase the exposure to buspirone. Use with caution and adjust dose. [Severe] Study
- **Busulfan** → see alkylating agents
- **Cabazitaxel** → see taxanes
- **Cabergoline** → see dopamine receptor agonists
- **Cabozaizinib** → see TABLE 15 p. 821 (myelosuppression), TABLE 9 p. 820 (QT-interval prolongation)
  - **Antiarhythmic** (dronedarone) are predicted to increase the exposure to cabozaizinib. [Moderate] Theoretical → Also see TABLE 9 p. 820
  - **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) moderately decrease the exposure to cabozaizinib. Avoid. [Moderate] Study
  - **Antifungals, azoles** (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to cabozaizinib. [Moderate] Theoretical
  - **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) slightly increase the exposure to cabozaizinib. [Moderate] Study → Also see TABLE 9 p. 820
  - **Aprepitant** is predicted to increase the exposure to cabozaizinib. [Moderate] Theoretical
  - **Bosentan** is predicted to decrease the exposure to cabozaizinib. [Moderate] Theoretical
  - **Calcium channel blockers** (diltiazem, verapamil) are predicted to increase the exposure to cabozaizinib. [Moderate] Theoretical
  - **Cobicistat** slightly increases the exposure to cabozaizinib. [Moderate] Study
  - **Cabozaizinib** is predicted to increase the risk of bleeding events when given with coumarins. [Severe] Theoretical
  - **Crizotinib** is predicted to increase the exposure to cabozaizinib. [Moderate] Theoretical → Also see TABLE 15 p. 821 → Also see TABLE 9 p. 820
  - **Efavirenz** is predicted to decrease the exposure to cabozaizinib. [Moderate] Theoretical
  - **Enzalutamide** moderately decreases the exposure to cabozaizinib. Avoid. [Moderate] Study
  - **Grapefruit juice** is predicted to increase the exposure to cabozaizinib. [Moderate] Theoretical
- **HIV-protease inhibitors** (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) slightly increase the exposure to cabozaizinib. [Moderate] Study → Also see TABLE 9 p. 820
- **HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to cabozaizinib. [Moderate] Theoretical
- **Idelalisib** slightly increases the exposure to cabozaizinib. [Moderate] Study → Also see TABLE 15 p. 821
- **Imatinib** is predicted to increase the exposure to cabozaizinib. [Moderate] Theoretical → Also see TABLE 15 p. 821
- **Macrolides (clarithromycin)** slightly increase the exposure to cabozaizinib. [Moderate] Study → Also see TABLE 9 p. 820
- **Macrolides (erythromycin)** are predicted to increase the exposure to cabozaizinib. [Moderate] Theoretical
- **Netupitant** is predicted to increase the exposure to cabozaizinib. [Moderate] Theoretical
- **Nevirapine** is predicted to decrease the exposure to cabozaizinib. [Moderate] Theoretical
- **S St John’s Wort** is predicted to increase the exposure to cabozaizinib. [Moderate] Theoretical
- **Caffeine citrate** increases the efficacy of antiarrhythmics (adenosine). Separate administration by 24 hours. [Mild] Study
- **Antiepileptics** (fosphenytoin, phenytoin) are predicted to moderately increase the clearance of caffeine citrate. Monitor and adjust dose. [Moderate] Study
- **HIV-protease inhibitors (ritonavir)** are predicted to moderately increase the clearance of caffeine citrate. Monitor and adjust dose. [Moderate] Study
- **Rifampicin** is predicted to moderately increase the clearance of caffeine citrate. Monitor and adjust dose. [Moderate] Study
- **SSRIs (fluvoxamine)** markedly decrease the clearance of caffeine citrate. Monitor and adjust dose. [Severe] Study
- **Caffeine citrate** decreases the clearance of theophylline. [Moderate] Study
- **Calcipotriol** → see vitamin D substances
- **Calcitonin (salmon)** decreases the concentration of lithium. Monitor lithium concentration and adjust dose. [Moderate] Study
- **Calcitriol** → see vitamin D substances
- **Calcium acetate** → see calcium salts
- **Calcium carbonate** → see calcium salts
- **Calcium channel blockers** → see TABLE 6 p. 819 (bradycardia), TABLE 8 p. 819 (hypotension)
- **amlodipine** - clevidipine - diltiazem - felodipine - isradipine - lacidipine - lercanidipine - nicardipine - nifedipine - nimodipine - verapamil
- **Verapamil** is predicted to increase the exposure to afatinib. Separate administration by 12 hours. [Moderate] Study
- **Calcium channel blockers** (diltiazem, verapamil) are predicted to increase the exposure to aldosterone antagonists (eplerenone). Adjust eplerenone dose. [Severe] Study → Also see TABLE 8 p. 819
- **Verapamil** moderately increases the exposure to aminophylline. [Moderate] Theoretical → Also see TABLE 8 p. 819
- **Calcium channel blockers** (diltiazem, verapamil) are predicted to increase the exposure to alprozolam. [Severe] Study
- **Verapamil** moderately increases the exposure to anthracyclines (doxorubicin). [Moderate] Study
- **Antiarhythmics** (disopyramide) are predicted to increase the risk of cardiodepression when given with verapamil. [Severe] Theoretical
- **Antiarhythmics (dronedarone)** are predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study
Antiarrhythmics (amiodarone) are predicted to increase the risk of cardiodepression when given with calcium channel blockers (diltiazem, verapamil). Avoid. [Severe] [Theoretical] → Also see TABLE 6 p. 819

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to antiarrhythmics (dronedarone). [Theoretical] Antiarrhythmics (dronedarone) increase the exposure to calcium channel blockers (diltiazem, verapamil). [Moderate] [Study]

Verapamil increases the risk of cardiodepression when given with antiarrhythmics (flecainide). [Severe] [Anecdotal] → Also see TABLE 6 p. 819

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the risk of cardiodepression when given with antifungals, azoles. [Theoretical] Intravenous verapamil increases the risk of cardiovascular side-effects when given with beta blockers, non-selective. Avoid. [Severe] [Study] → Also see TABLE 6 p. 819 → Also see TABLE 8 p. 819

Aprepitant is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] [Study]

Aprepitant is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). [Moderate] [Study]

Diltiazem increases the exposure to aprepitant and aprepitant increases the exposure to diltiazem. [Moderate] [Study]

Verapamil is predicted to increase the exposure to aprepitant and aprepitant is predicted to increase the exposure to verapamil. [Moderate] [Theoretical]

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to axitinib. [Moderate] [Theoretical]

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] [Theoretical]

Diltiazem is predicted to increase the risk of cardiodepression when given with beta blockers, non-selective. [Severe] [Study] → Also see TABLE 6 p. 819 → Also see TABLE 8 p. 819

Intravenous verapamil increases the risk of cardiovascular side-effects when given with beta blockers, non-selective. Avoid. [Severe] [Study] → Also see TABLE 6 p. 819 → Also see TABLE 8 p. 819

Oral verapamil increases the risk of cardiovascular side-effects when given with beta blockers, non-selective. [Severe] [Study] → Also see TABLE 6 p. 819 → Also see TABLE 8 p. 819

Bosentan is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] [Theoretical]

Bosentan is predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). [Moderate] [Theoretical]

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to bosutinib. Avoid or adjust bosutinib dose. [Severe] [Theoretical]

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to buspirone. Use with caution and adjust dose. [Moderate] [Study]

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to cabozantinib. [Moderate] [Theoretical]

Calcium channel blockers (diltiazem) are predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] [Study] → Also see TABLE 8 p. 819

Calcium channel blockers (verapamil) are predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] [Study] → Also see TABLE 8 p. 819

Calcium channel blockers (diltiazem) are predicted to increase the exposure to calcium channel blockers (felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] [Study] → Also see TABLE 8 p. 819

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ceritinib. [Moderate] [Theoretical]

Calcium channel blockers (diltiazem, nicardipine, verapamil) increase the concentration of ciclosporin. [Severe] [Study]

Ciclosporin moderately increases the exposure to lercanidipine. Use with caution or avoid. [Severe] [Study]

Cobicistat is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] [Study]

Cobicistat is predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). [Severe] [Study]

Cobicistat is predicted to markedly increase the exposure to lercanidipine. Avoid. [Severe] [Study]

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to colchicine. Adjust colchicine dose. [Severe] [Study]
Calcium channel blockers (continued)

- Crizotinib is predicted to decrease the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. (Moderate) Study
- Crizotinib is predicted to decrease the exposure to crizotinib. (Moderate) Theoretical → Also see TABLE 6 p. 819
- Crizotinib is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. (Moderate) Study
- Verapamil increases the exposure to dabigatran. Adjust dabigatran dose. (Severe) Study
- Intravenous dantrolene potentially increases the risk of acute hyperkalaemia and cardiovascular collapse when given with calcium channel blockers (diltiazem, verapamil). Avoid. (Severe) Aneotal
- Calcium channel blockers (diltiazem, verapamil) are predicted to slightly increase the exposure to darifenacin. (Moderate) Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to dasatinib. (Severe) Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of digoxin. Monitor and adjust dose. (Severe) Study → Also see TABLE 6 p. 819
- Calcium channel blockers (diltiazem, verapamil) increase the risk of QT-prolongation when given with domperidone. Avoid. (Severe) Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to dopamine receptor agonists (bromocriptine, cabergoline). (Severe) Theoretical → Also see TABLE 8 p. 819
- Calcium channel blockers (diltiazem, verapamil) are predicted to moderately increase the exposure to dutasteride. (Moderate) Study
- Verapamil is predicted to slightly increase the exposure to edoxaban. (Severe) Theoretical
- Efavirenz is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. (Moderate) Theoretical
- Efavirenz is predicted to decrease the exposure to calcium channel blockers (diltiazem, verapamil). (Moderate) Theoretical
- Enalapril is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. (Moderate) Study
- Enalapril is predicted to decrease the exposure to diltiazem. (Severe) Study
- Enalapril is predicted to decrease the exposure to isradipine. Avoid. (Moderate) Study
- Enalapril is predicted to decrease the exposure to verapamil. (Severe) Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the risk of ergotism when given with ergotamine. (Severe) Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the risk of ergotism when given with ergotamine. (Severe) Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to erlotinib. (Moderate) Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of everolimus. Avoid or adjust dose. (Moderate) Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose in hepatic and renal impairment. (Mild) Study
- Verapamil is predicted to increase the exposure to fidaxomicin. Avoid. (Moderate) Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to fingolimod. Avoid. (Moderate) Theoretical → Also see TABLE 6 p. 819
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to gefitinib. (Moderate) Theoretical
- Grapefruit juice very slightly increases the exposure to amlodipine. Avoid. (Mild) Study
- Grapefruit juice increases the exposure to calcium channel blockers (nifedipine, verapamil). Avoid. (Mild) Study
- Grapefruit juice increases the exposure to felodipine. Avoid. (Moderate) Study
- Grapefruit juice is predicted to increase the exposure to lercanidipine. Avoid. (Moderate) Theoretical
- Grapefruit juice increases the exposure to nicardipine. (Mild) Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 222. (Moderate) Theoretical → Also see TABLE 8 p. 819
- H₂ receptor antagonists (cimetidine) (high-dose) are predicted to increase the exposure to lercanidipine. (Moderate) Theoretical
- H₂ receptor antagonists (cimetidine) moderately increase the exposure to nifedipine. Monitor and adjust dose. (Severe) Study
- H₂ receptor antagonists (cimetidine) increase the exposure to verapamil. (Moderate) Study
- H₂ receptor antagonists (cimetidine) slightly increase the exposure to calcium channel blockers (diltiazem, isradipine, nimodipine). Monitor and adjust dose. (Moderate) Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to markedly increase the exposure to lercanidipine. Avoid. (Severe) Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). (Severe) Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ibritunib. Avoid or adjust ibritunib dose. (Severe) Theoretical
- Idelalisib is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. (Moderate) Study
- Idelalisib is predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). (Severe) Study
- Idelalisib is predicted to markedly increase the exposure to lercanidipine. Avoid. (Severe) Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to imatinib. Avoid. (Severe) Theoretical
- Imatinib is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. (Moderate) Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ivabradine. Avoid. (Moderate) Study → Also see TABLE 6 p. 819
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ivacaftor. Adjust ivacaftor dose, p. 179. (Severe) Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to lopinavir. (Moderate) Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the risk of neurotoxicity when given with lithium. (Severe) Aneotal
- Calcium channel blockers (amlodipine, lacidipine) are predicted to increase the exposure to tomitapide. Separate administration by 12 hours. (Moderate) Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to tomitapide. Avoid. (Moderate) Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to luridazole. (Moderate) Study → Also see TABLE 8 p. 819
- Macrolides (clarithromycin) are predicted to markedly increase the exposure to lercanidipine. Avoid. (Severe) Study
- Macrolides (erythromycin) are predicted to increase the exposure to diltiazem. (Severe) Theoretical
- Macrolides (erythromycin) are predicted to increase the exposure to verapamil. (Severe) Study
- Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine,
nifedipine, nimodipine). Monitor and adjust dose. [Moderate]

- Macrolides (clarithromycin) are predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). [Severe]
- Intravenous magnesium potentially increases the risk of hypotension when given with calcium channel blockers (amlodipine, clevidipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine, verapamil) in pregnant women. [Severe]

- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. [Severe]

- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to naltrexol. Adjust naltrexol dose and monitor side effects. [Moderate]

- Netupitant is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate]

- Nevirapine is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate]

- Nevirapine is predicted to decrease the exposure to calcium channel blockers (diltiazem, verapamil). [Moderate]

- Nilotinib is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate]

- Verapamil is predicted to increase the exposure to nintedanib. [Moderate]

- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose. [Moderate]

- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to oxycodone. [Moderate]

- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodeone). Monitor and adjust dose. [Moderate]

- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to oxybutynin. [Mild]

- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to pazopanib. [Moderate]

- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil). Adjust avanafil dose. [Moderate]

- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Monitor and adjust sildenafil dose. [Moderate]

- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (vardenafil). Adjust dose. [Severe]

- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to pimozide. Avoid. [Severe]

- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to quetiapine. Avoid. [Moderate]

- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ranolazine. [Severe]

- Rifampicin is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine). Monitor and adjust dose. [Moderate]
Calcium salts

calcium acetate • calcium carbonate • calcium chloride • calcium gluconate • calcium lactate • calcium phosphate

**SEPARATION OF ADMINISTRATION** Calcium carbonate-containing antacids should preferably not be taken at the same time as other drugs since they might impair absorption. Antacids might damage enteric coatings designed to prevent dissolution in the stomach.

- **Oral calcium salts** decrease the absorption of alkylating agents (estramustine). **(Severe) Study**
- **Calcium carbonate** decreases the absorption of antimalarials (chloroquine). Separate administration by at least 4 hours. **(Moderate) Study**
- **Calcium carbonate** is predicted to decrease the absorption of antimalarials (proguanil). Separate administration by at least 2 hours. **(Moderate) Study**
- **Oral calcium salts** decrease the absorption of bisphosphonates (alendronic acid). Alerdronic acid should be taken at least 30 minutes before calcium salts. **(Moderate) Study**
- **Oral calcium salts** are predicted to decrease the absorption of oral bisphosphonates (ibandronic acid). Avoid calcium salts for at least 6 hours before or 1 hour after ibandronic acid. **(Moderate) Theoretical**
- **Oral calcium salts** decrease the absorption of bisphosphonates (risedronate). Separate administration by at least 2 hours. **(Moderate) Study**
- **Cefazolin** (ceftriaxone) increases the risk of cardio-respiratory arrest when given with calcium chloride. Avoid. **(Severe) Anecdotal**
- **Cefazolin** (ceftriaxone) increases the risk of cardio-respiratory arrest when given with intravenous calcium gluconate. Avoid. **(Severe) Anecdotal**
- **Intravenous calcium salts** increase the concentration of digoxin. Avoid. **(Moderate) Anecdotal**
- **Oral calcium salts** decrease the absorption of dolutegravir. Dolutegravir should be taken 2 hours before or 6 hours after calcium salts. **(Moderate) Study**
- **Oral calcium salts** decrease the absorption of etrlobopag. Etrlobopag should be taken 2 hours before or 4 hours after calcium salts. **(Severe) Study**
- **Calcium carbonate** decreases the absorption of hydroxychloroquine. Separate administration by at least 4 hours. **(Moderate) Study**
- **Calcium carbonate** decreases the absorption of iron (oral). Calcium carbonate should be taken 1 hour before or 2 hours after iron (oral). **(Moderate) Study**
- **Calcium carbonate** is predicted to decrease the exposure to leptheropin. Separate administration by 4 hours. **(Moderate) Theoretical**
- **Oral calcium salts** are predicted to decrease the absorption of levethyroxine. Separate administration by at least 4 hours. **(Moderate) Anecdotal**
- **Calcium carbonate** decreases the absorption of quinolones (ciprofloxacin, nalidixic acid). Separate administration by 2 hours. **(Moderate) Study**
- **Calcium carbonate** decreases the absorption of quinolones (norfloxacin). Norfloxacin should be taken 2 hours before or 4 hours after calcium carbonate. **(Moderate) Study**
- **Calcium carbonate** is predicted to slightly decrease the exposure to rifampicine. Calcium carbonate should be taken 2 hours before or 4 hours after rifampicine. **(Severe) Theoretical**
- **Oral calcium salts** decrease the absorption of strontium ranelate. Separate administration by 2 hours. **(Moderate) Study**
- **Calcium carbonate** is predicted to decrease the absorption of tetracyclines. Separate administration by 2 to 3 hours. **(Moderate) Theoretical**
- **Thiazide diuretics** increase the risk of hypercalcaemia when given with calcium salts. **(Severe) Anecdotal**
- **Calcium carbonate** is predicted to decrease the concentration of velpatavasin. Separate administration by 4 hours. **(Moderate) Anecdotal**
- **Oral calcium salts** decrease the absorption of zinc. **(Moderate) Study**

**Cannabis extract** → see TABLE 15 p. 821 (myelosuppression)
- **Allopurinol** is predicted to decrease the effects of capicabine. Avoid. **(Severe) Study**
- **Capicabine** increases the concentration of antiepileptics (fospirphenytoin, phenytoin). **(Severe) Anecdotal**
- **Capicabine** increases the effects of coumarins. Monitor INR and adjust dose. **(Moderate) Anecdotal**
- **Folates** (folic acid) are predicted to increase the risk of toxicity when given with capicabine. **(Severe) Anecdotal**
- **Folates** (folic acid) increase the risk of toxicity when given with capicabine. **(Severe) Study**
- **H+ receptor antagonists** (cimetidine) are predicted to slightly increase the exposure to capicabine. **(Severe) Theoretical**
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with capicabine. Public Health England advises avoid. **(Severe) Theoretical**
- **Metronidazole** is predicted to increase the risk of capicabine toxicity when given with capicabine. **(Severe) Theoretical**

**Captopril** → see ACE inhibitors

**Carbamidepine** → see antiepileptics

**Carbamazepine** → see platinum compounds

**Carazolamiz** → see myelosuppression

**Carmustine** → see alkylating agents

**Carnolol** → see beta blockers, non-selective
Carvedilol → see beta blockers, non-selective

Ciclosporin

▶ Antiplatelets (carbamazepine, fosphenytoin, phenytoin) are predicted to decrease the concentration of ciclosporin. Adjust ciclosporin dose, p. 356. (Moderate) Theoretical

▶ Ciclosporin slightly increases the exposure to ciclosporin. (Severe) Study

▶ Corticosteroids (dexamethasone) are predicted to decrease the concentration of ciclosporin. Adjust ciclosporin dose, p. 356. (Moderate) Theoretical

▶ Efavirenz is predicted to increase the concentration of ciclosporin. Adjust ciclosporin dose, p. 356. (Severe) Study

▶ Nevirapine is predicted to decrease the concentration of ciclosporin. Adjust dose. (Moderate) Study

▶ Rifampicin decreases the concentration of ciclosporin. Adjust ciclosporin dose, p. 356. (Moderate) Study

Catumaxomab → see monoclonal antibodies

Cefaclor → see cephalosporins

Cefadroxil → see cephalosporins

Cefalexin → see cephalosporins

Cefixime → see cephalosporins

Cefotaxime → see cephalosporins

Cefradine → see cephalosporins

Ceftazidine → see cephalosporins

Ceftobiprole → see cephalosporins

Ceftolozane → see cephalosporins

Ceftriaxone → see cephalosporins

Cefuroxime → see cephalosporins

Cefuroxime → see cephalosporins

Celecoxib → see NSAIDs

Celiprolol → see beta blockers, selective

Cephalosporins see Table 2 p. 818 (nephrotoxicity)

▶ Cefadroxil, cefalexin, cefixime, cefotaxime, cefradine, ceftriaxone, cefazidime, ceftobiprole, ceftolozane, ceftriaxone, cefuroxime

▶ Ceftobiprole is predicted to increase the exposure to bosentan. (Moderate) Theoretical

▶ Ceftriaxone increases the risk of cardio-respiratory arrest when given with calcium salts (calcium chloride). Avoid. (Severe) Anecdotal

▶ Ceftriaxone increases the risk of cardio-respiratory arrest when given with intravenous calcium salts (calcium gluconate). Avoid. (Severe) Anecdotal

▶ Ceftriaxone potentially increases the risk of bleeding events when given with coumarins. (Severe) Anecdotal

▶ Ceftriaxone potentially increases the risk of bleeding events when given with phenindione. (Severe) Anecdotal

▶ Ceftobiprole is predicted to increase the concentration of statins. (Moderate) Theoretical

▶ Ceftobiprole is predicted to increase the concentration of sulfonylureas (glibenclamide). (Moderate) Theoretical

Ceritinib → see Table 15 p. 821 (myelosuppression), Table 9 p. 820 (QT-interval prolongation)

▶ Ceritinib is predicted to increase the exposure to aliskiren. (Moderate) Theoretical

▶ Antacids are predicted to decrease the absorption of ceritinib. Separate administration by 2 hours. (Moderate) Theoretical

▶ Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to ceritinib. (Moderate) Theoretical → Also see Table 9 p. 820

▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ceritinib. Avoid. (Severe) Study

▶ Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ceritinib. (Moderate) Theoretical

▶ Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ceritinib. Avoid or adjust ceritinib dose. (Severe) Study → Also see Table 9 p. 820

▶ Ceritinib is predicted to increase the exposure to antihistamines, non-sedating (fexofenadine). (Moderate) Theoretical

▶ Aprepitant is predicted to increase the exposure to ceritinib. (Moderate) Theoretical

▶ Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ceritinib. (Moderate) Theoretical

▶ Ceritinib is predicted to increase the exposure to ciclosporin. Avoid. (Severe) Theoretical

▶ Cobicistat is predicted to increase the exposure to ceritinib. Avoid or adjust ceritinib dose. (Severe) Study

▶ Ceritinib is predicted to increase the exposure to colchicine. (Moderate) Theoretical

▶ Ceritinib is predicted to increase the exposure to coumarins (warfarin). Avoid. (Severe) Theoretical

▶ Crizotinib is predicted to increase the exposure to ceritinib. (Moderate) Theoretical → Also see Table 15 p. 821 → Also see Table 9 p. 820

▶ Ceritinib is predicted to increase the exposure to dabigatran. (Moderate) Theoretical

▶ Ceritinib is predicted to increase the risk of bradycardia when given with digoxin. Avoid. (Severe) Theoretical

▶ Ceritinib is predicted to increase the exposure to edoxaban. (Moderate) Theoretical

▶ Enzalutamide is predicted to decrease the exposure to ceritinib. Avoid. (Severe) Study

▶ Ceritinib is predicted to increase the exposure to ergotamine. Avoid. (Severe) Theoretical

▶ Ceritinib is predicted to increase the exposure to everolimus. (Moderate) Theoretical → Also see Table 15 p. 821

▶ Grapefruit juice is predicted to increase the exposure to ceritinib. Avoid. (Severe) Study

▶ H₃ receptor antagonists are predicted to decrease the absorption of ceritinib. (Moderate) Theoretical

▶ HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to ceritinib. Avoid or adjust ceritinib dose. (Severe) Study → Also see Table 9 p. 820

▶ HIV-protease inhibitors (indinavir) are predicted to increase the exposure to ceritinib. (Moderate) Theoretical

▶ Idealisib is predicted to increase the exposure to ceritinib. Avoid or adjust ceritinib dose. (Severe) Study → Also see Table 15 p. 821

▶ Imatinib is predicted to increase the exposure to ceritinib. (Moderate) Theoretical → Also see Table 15 p. 821

▶ Lapatinib is predicted to increase the exposure to ceritinib. (Moderate) Theoretical → Also see Table 9 p. 820

▶ Ceritinib is predicted to increase the exposure to loperamide. (Moderate) Theoretical

▶ Macrolides (azithromycin, erythromycin) are predicted to increase the exposure to ceritinib. (Moderate) Theoretical

▶ Macrolides (clarithromycin) are predicted to increase the exposure to ceritinib. Avoid or adjust ceritinib dose. (Severe) Study → Also see Table 9 p. 820

▶ Netupitant is predicted to increase the exposure to ceritinib. (Moderate) Theoretical

▶ Nilotinib is predicted to increase the exposure to ceritinib. (Moderate) Theoretical → Also see Table 15 p. 821 → Also see Table 9 p. 820

▶ Ceritinib is predicted to increase the exposure to NSAIDs (celecoxib, diclofenac). Adjust dose. (Moderate) Theoretical

▶ Ceritinib is predicted to increase the exposure to opioids (alfentanil, fentanyl). Avoid. (Severe) Theoretical

▶ Ceritinib is predicted to increase the exposure to pimozone. Avoid. (Severe) Theoretical → Also see Table 9 p. 820

▶ Proton pump inhibitors are predicted to decrease the absorption of ceritinib. (Moderate) Theoretical

▶ Ranolazine is predicted to increase the exposure to ceritinib. (Moderate) Theoretical → Also see Table 9 p. 820

▶ Rifampicin is predicted to decrease the exposure to ceritinib. Avoid. (Severe) Study

▶ Ceritinib is predicted to increase the exposure to sirolimus. Avoid. (Severe) Theoretical

▶ St John’s Wort is predicted to decrease the exposure to ceritinib. Avoid. (Severe) Theoretical

▶ Ceritinib is predicted to increase the exposure to sulfonyleureas (glimepiride). Adjust dose. (Moderate) Theoretical

▶ Ceritinib is predicted to increase the exposure to tacrolimus. Avoid. (Severe) Theoretical

▶ Ceritinib is predicted to increase the exposure to taxanes (paclitaxel). (Moderate) Theoretical → Also see Table 15 p. 821
Ceritinib is predicted to increase the exposure to topotecan. Adjust ambrisentan dose. (Moderate) Study

Ciclosporin increases the concentration of anthracyclines (daunorubicin, doxorubicin, epirubicin, idarubicin, mitoxantrone). (Severe) Study

Antiarrhythmics (amiodarone) increase the concentration of ciclosporin. Monitor ciclosporin concentration and adjust dose. (Severe) Study

Antifungals, azoles (fluconazole, itraconazole, ketoconazole, posaconazole, voriconazole) increase the concentration of ciclosporin. (Severe) Study

Table 11

**ROUTE-SPECIFIC INFORMATION** Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

- **Antiepileptics** (phenobarbital, primidone) decrease the concentration of chlormphenicol. (Moderate) Study
- **Chloral hydrate** | see TABLE 11 p. 820 (CNS depressant effects)
- **Chlorpromazine** | see phenothiazines
- **Chloroquine** | see antimalarials
- **Ciclosporin** | see corticosteroids
- **Cholinesterase inhibitors** are predicted to decrease the concentration of choline salicylate. (Moderate) Study
- **Ciclesonide** | see corticosteroids
- **Ciclosporin** | see TABLE 2 p. 818 (nephrotoxicity), TABLE 16 p. 822 (increased serum potassium)

Ciclosporin is predicted to increase the exposure to etoposide. Monitor and adjust dose. (Severe) Study

Ciclosporin increases the exposure to everolimus. Avoid or adjust dose. (Severe) Study

Ciclosporin is predicted to increase the risk of nephrotoxicity when given with ceritinib. (Increased serum potassium)

Ciclosporin increases the exposure to efavirenz. Monitor ciclosporin concentration and adjust dose. (Moderate) Study

Ciclosporin increases the exposure to efavirenz. Adjust efavirenz dose. (Severe) Study

Ciclosporin moderately increases the exposure to ezetimibe. Avoid or adjust dose. (Severe) Study

Ciclosporin moderately increases the exposure to ezetimibe. Adjust ezetimibe dose. (Moderate) Study

Fibates (bezafibrate) are predicted to increase the risk of nephrotoxicity when given with ciclosporin. (Severe) Theoretical

Fibates (fenofibrate) increase the risk of nephrotoxicity when given with ciclosporin. (Severe) Study
Ciclosporin is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

Lumacaftor is predicted to increase the exposure to cilostazol dose. (Moderate) Study

Lanreotide is predicted to decrease the absorption of oral ciclosporin. Adj. dose. (Severe) Theoretical

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with ciclosporin. Public Health England advises avoid. (Severe) Theoretical

Ciclosporin is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

Lumacaftor is predicted to increase the exposure to ciclosporin. Avoid. (Severe) Study

Macrolides (clarithromycin, erythromycin) increase the concentration of ciclosporin. (Severe) Theoretical

Ciclosporin is predicted to increase the concentration of ranolazine and ranolazine is predicted to increase the concentration of ciclosporin. (Moderate) Theoretical

Ciclosporin moderately increases the exposure to repaglinide. (Moderate) Study

Rifampicin decreases the concentration of ciclosporin. (Severe) Study

Ciclosporin very markedly increases the exposure to rifaximin. Avoid. (Severe) Study

Ciclosporin is predicted to increase the exposure to riociguat. (Moderate) Theoretical

Ciclosporin is predicted to increase the exposure to sacubitril. (Moderate) Theoretical

Ciclosporin moderately increases the exposure to sirolimus. Separate administration by 4 hours. (Severe) Study

St John's Wort decreases the concentration of ciclosporin. Avoid. (Moderate) Study

Ciclosporin very markedly increases the exposure to statins (atorvastatin). Avoid or adjust atorvastatin dose. p. 128. (Severe) Study

Ciclosporin moderately increases the exposure to statins (fluvastatin). (Severe) Study

Ciclosporin markedly to very markedly increases the exposure to statins (pravastatin). Adjust pravastatin dose. (Severe) Study

Ciclosporin markedly increases the exposure to statins (rosuvastatin, simvastatin). Avoid. (Severe) Study

Sulfipyrazone decreases the concentration of ciclosporin. (Severe) Study

Ciclosporin increases the concentration of tacrolimus. Avoid. (Severe) Study → Also see TABLE 2 p. 818 → Also see TABLE 16 p. 822

Ciclosporin is predicted to increase the exposure to ticagrelor. Use with caution or avoid. (Severe) Study

Ciclosporin is predicted to increase the exposure to topotecan. (Severe) Study

Ciclosporin is predicted to increase the concentration of trametinib. (Moderate) Theoretical

Ursodeoxycholic acid affects the concentration of ciclosporin. Use with caution and adjust dose. (Severe) Anecdotal

Ciclosporin is predicted to increase the exposure to venetoclax. Avoid or monitor for toxicity. (Severe) Theoretical

Vitamin E substances affect the exposure to ciclosporin. (Moderate) Study

Cilostazol → see TABLE 4 p. 818 (antiplatelet effects)

GENERAL INFORMATION Concurrent use with 2 or more antplatelets or anticoagulants is contra-indicated.

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to alter the effects of cilostazol. (Moderate) Theoretical

Antifungals, azoles (fluconazole) are predicted to increase the exposure to cilostazol. Adjust cilostazol dose. (Moderate) Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to cilostazol. Adjust cilostazol dose. (Moderate) Study

Cobicistat is predicted to moderately increase the exposure to cilostazol. Adjust cilostazol dose. (Moderate) Study

Enzalutamide is predicted to alter the effects of cilostazol. (Moderate) Theoretical

Ciclosporin is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

Macrolides (clarithromycin) are predicted to moderately increase the exposure to cilostazol. Adjust cilostazol dose. (Moderate) Study

Ciclosporin is predicted to increase the exposure to cilostazol. Adjust cilostazol dose. (Moderate) Study

Ciclosporin increases the concentration of NSAID. (diclofenac). (Severe) Study → Also see TABLE 2 p. 818 → Also see TABLE 16 p. 822

Octreotide decreases the absorption of oral ciclosporin. Adjust ciclosporin dose. p. 496. (Severe) Anecdotal

Palbociclib is predicted to increase the exposure to ciclosporin. Adjust dose. (Moderate) Theoretical

Pasireotide is predicted to decrease the absorption of oral ciclosporin. Adjust dose. (Severe) Theoretical

Pitolisant is predicted to decrease the exposure to ciclosporin. Avoid. (Severe) Theoretical

Ciclosporin is predicted to increase the concentration of nintedanib. (Moderate) Study

Ciclosporin is predicted to increase the exposure to nintedanib. (Moderate) Study

Ciclosporin increases the concentration of Cox-2 inhibitors. (diclofenac). (Severe) Study → Also see TABLE 2 p. 818

Ciclosporin is predicted to increase the exposure to atorvastatin, simvastatin. Avoid or adjust atorvastatin dose. p. 128. (Severe) Study

Ciclosporin markedly increases the exposure to atorvastatin. Avoid. (Severe) Study

Ciclosporin markedly increases the exposure to atorvastatin. (Moderate) Theoretical

Ciclosporin is predicted to increase the exposure to anticholinesterases, centrally acting (donepezil). (Moderate) Theoretical

FOOD AND LIFESTYLE Dose adjustment might be necessary if smoking started or stopped during treatment.

Cinacalcet is predicted to increase the exposure to anticoagulants (acenocoumarol). Avoid. (Severe) Theoretical

Ciclosporin is predicted to increase the exposure to anticoagulants (acenocoumarol). (Moderate) Theoretical

Ciclosporin is predicted to increase the exposure to anticoagulants (acenocoumarol). Monitor and adjust dose. (Moderate) Study

Ciclosporin is predicted to increase the exposure to anticoagulants (acenocoumarol). Avoid. (Severe) Study

Ciclosporin is predicted to affect the exposure to anticoagulants (acenocoumarol). Avoid. (Severe) Study

Ciclosporin is predicted to affect the exposure to anticoagulants (acenocoumarol). (Moderate) Theoretical
Cinacalcet (continued)

- Cinacalcet is predicted to increase the exposure to anticholinesterase, centrally acting (gaiantamine). Monitor and adjust dose. (Moderate) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to cinacalcet. Adjust dose. (Moderate) Study
- Cinacalcet is predicted to moderately increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 240. (Moderate) Study
- Cinacalcet is predicted to markedly increase the exposure to atomoxetine. Adjust dose. (Severe) Study
- Cinacalcet is predicted to increase the exposure to beta blockers, non-selective (carvedilol, timolol). (Moderate) Study
- Cinacalcet is predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). (Moderate) Study
- Cobicistat is predicted to moderately increase the exposure to cinacalcet. Adjust dose. (Moderate) Study
- Cinacalcet is predicted to slightly increase the exposure to darifenacin. (Mild) Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to moderately increase the exposure to cinacalcet. Adjust dose. (Moderate) Study
- Idealisib is predicted to moderately increase the exposure to cinacalcet. Adjust dose. (Moderate) Study
- Macrolides (clarithromycin) are predicted to moderately increase the exposure to cinacalcet. Adjust dose. (Moderate) Study
- Cinacalcet is predicted to decrease the efficacy of opioids (codeine). (Moderate) Theoretical
- Cinacalcet is predicted to decrease the efficacy of opioids (tramadol). (Severe) Study
- Cinacalcet is predicted to moderately increase the exposure to pitolisant. Use with caution and adjust dose. (Moderate) Study
- Cinacalcet is predicted to increase the exposure to risperidone. Adjust dose. (Moderate) Study
- SSRIs (fluvoxamine) are predicted to increase the exposure to cinacalcet. Adjust dose. (Moderate) Theoretical
- Cinacalcet is predicted to increase the exposure to SSRIs (dapoxetine). (Moderate) Theoretical
- Cinacalcet is predicted to decrease the efficacy of tamoxifen. Avoid. (Severe) Study
- Cinacalcet is predicted to increase the exposure to tricyclic antidepressants. Monitor for toxicity and adjust dose. (Severe) Study
- Cinacalcet is predicted to increase the exposure to vortioxetine. Monitor and adjust dose. (Moderate) Study
- Cinnarizine → see antihistamines, sedating
- Ciprofibrate → see fibrates
- Ciprofloxacin → see quinolones
- Cisatracurium → see neuromuscular blocking drugs, non-depolarising
- Cisplatin → see platinum compounds
- Citalopram → see SSRIs
- Cladribine → see TABLE 15 p. 821 (myelosuppression)
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with clofarabine. Public Health England advises avoid. (Severe) Theoretical
- Clonazepam potentially increases the risk of QT-prolongation when given with bedaquiline. (Severe) Study
- Clomethiazole → see TABLE 11 p. 820 (CNS depressant effects)
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to clomethiazole. Monitor and adjust dose. (Moderate) Study Also see TABLE 11 p. 820
- Enzalutamide decreases the exposure to clomethiazole. Monitor and adjust dose. (Moderate) Study
- Rifampicin decreases the exposure to clomethiazole. Monitor and adjust dose. (Moderate) Study
- Clopayolide → see tricyclic antidepressants
- Clonazepam potentially affects the concentration of antiepileptics (fosphenytoin, phenytoin). (Severe) Theoretical
- Clonidine → see TABLE 6 p. 819 (hypotension), TABLE 8 p. 819 (CNS depressant effects)
- Clonidined is predicted to decrease the effects of histamine. Avoid. (Severe) Theoretical Also see TABLE 8 p. 819
- Tricyclic antidepressants decrease the antihypertensive effects of clonidine. Monitor and adjust dose. (Moderate) Anecdotal Also see TABLE B p. 819
- Clopidogrel increases the exposure to clopidogrel. (Severe) Study
- Clopidogrel is predicted to increase the exposure to loperamide. (Severe) Theoretical
- Moclobemide is predicted to decrease the efficacy of clopidogrel. Avoid. (Moderate) Study
- Clopidogrel is predicted to increase the exposure to pioglitazone. (Severe) Theoretical
- Proton pump inhibitors (esomeprazole, omeprazole) are predicted to decrease the efficacy of clopidogrel. Avoid. (Moderate) Study
- Clomethiazole increases the exposure to repaglinide. (Severe) Study
- SSRIs (fluvoxamine) are predicted to decrease the efficacy of clopidogrel. Avoid. (Moderate) Study
- Clomethiazole increases the exposure to statins (rosuvastatin). Adjust rosuvastatin dose, p. 130. (Moderate) Study
- Clonazepam is predicted to increase the exposure to antihistamines, sedating
- Clozapine is predicted to increase the risk of generalised infection (possibly life-threatening) when given with clofarabine. Public Health England advises avoid. (Severe) Theoretical
- Clonazepam potentially affects the concentration of antiepileptics (fosphenytoin, phenytoin). (Severe) Anecdotal
- Clofarabine → see TABLE 15 p. 821 (myelosuppression)
- clofarabine. Public Health England advises avoid. (Severe) Theoretical
- Clomethiazole potentially increases the risk of QT-prolongation when given with bedaquiline. (Severe) Study
- FOOD AND LIFESTYLE Alcohol consumption can cause serious, potentially fatal, CNS depression with clomethiazole.
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to clomethiazole. Monitor and adjust dose. (Moderate) Study Also see TABLE 11 p. 820
- Tricyclic antidepressants decrease the antihypertensive effects of clonidine. Monitor and adjust dose. (Moderate) Anecdotal Also see TABLE 8 p. 819
- Clopidogrel increases the exposure to clopidogrel. (Severe) Study
- Clopidogrel is predicted to increase the exposure to loperamide. (Severe) Theoretical
- Moclobemide is predicted to decrease the efficacy of clopidogrel. Avoid. (Moderate) Study
- Clopidogrel is predicted to increase the exposure to pioglitazone. (Severe) Theoretical
- Proton pump inhibitors (esomeprazole, omeprazole) are predicted to decrease the efficacy of clopidogrel. Avoid. (Moderate) Study
- Clomethiazole increases the exposure to repaglinide. (Severe) Study
- SSRIs (fluvoxamine) are predicted to decrease the efficacy of clopidogrel. Avoid. (Moderate) Study
- Clomethiazole increases the exposure to statins (rosuvastatin). Adjust rosuvastatin dose, p. 130. (Moderate) Study
- Clomethiazole is predicted to increase the exposure to antihistamines, sedating
- Clozapine is predicted to increase the risk of generalised infection (possibly life-threatening) when given with clofarabine. Public Health England advises avoid. (Severe) Theoretical
- Clomethiazole potentially increases the risk of QT-prolongation when given with bedaquiline. (Severe) Study
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with clofarabine. Public Health England advises avoid. (Severe) Theoretical
- Clomethiazole potentially increases the risk of QT-prolongation when given with bedaquiline. (Severe) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to clomethiazole. Monitor and adjust dose. (Moderate) Study Also see TABLE 11 p. 820
- Enzalutamide decreases the exposure to clomethiazole. Monitor and adjust dose. (Moderate) Study
- Rifampicin decreases the exposure to clomethiazole. Monitor and adjust dose. (Moderate) Study
- Clomipramine → see tricyclic antidepressants
- Clonazepam potentially affects the concentration of antiepileptics (fosphenytoin, phenytoin). (Severe) Theoretical
- Clonidine → see TABLE 6 p. 819 (hypotension), TABLE 8 p. 819 (CNS depressant effects)
- Clonidine is predicted to decrease the effects of histamine. Avoid. (Severe) Theoretical Also see TABLE 8 p. 819
- Tricyclic antidepressants decrease the antihypertensive effects of clonidine. Monitor and adjust dose. (Moderate) Anecdotal Also see TABLE B p. 819
- Clopamide → see thiourea diuretics
- Clopidogrel is predicted to increase the exposure to clopidogrel. (Severe) Study
- Clopidogrel is predicted to increase the exposure to pioglitazone. (Severe) Theoretical
- Proton pump inhibitors (esomeprazole, omeprazole) are predicted to decrease the efficacy of clopidogrel. Avoid. (Moderate) Study
- Clopidogrel increases the exposure to repaglinide. (Severe) Study
- SSRIs (fluvoxamine) are predicted to decrease the efficacy of clopidogrel. Avoid. (Moderate) Study
- Clomethiazole increases the exposure to statins (rosuvastatin). Adjust rosuvastatin dose, p. 130. (Moderate) Study
- Clonazepam potentially affects the concentration of antiepileptics (fosphenytoin, phenytoin). (Severe) Anecdotal
- Clofarabine → see TABLE 15 p. 821 (myelosuppression)
- Dose adjustment might be necessary if smoking started or stopped during treatment.
- Avoid concomitant use of clozapine with drugs that have a substantial potential for causing agranulocytosis.
- Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to clozapine. (Moderate) Anecdotal
- Antiepileptics (phenobarbital, primidone) decrease the exposure to clozapine. (Moderate) Anecdotal Also see TABLE 11 p. 820
- Combined hormonal contraceptives increase the concentration of clozapine. Monitor side effects and adjust dose. (Severe) Study
- Clozapine is predicted to decrease the effects of dopamine receptor agonists. (Moderate) Theoretical Also see TABLE 8 p. 819 Also see TABLE 10 p. 820
- Clozapine is predicted to decrease the effects of histamine. Avoid. (Severe) Theoretical Also see TABLE 8 p. 819
- HIV-protease inhibitors (ritonavir) are predicted to increase the exposure to clozapine. Avoid. (Severe) Theoretical
- Iron chelators (deferasirox) are predicted to increase the exposure to clozapine. Avoid. (Moderate) Theoretical
- Clozapine is predicted to decrease the effects of levodopa.
  (Severe) Theoretical → Also see TABLE 8 p. 819
- Quinolones (ciprofloxacin) increase the concentration of clozapine. Monitor side effects and adjust dose. (Severe) Study
- Rifampicin decreases the exposure to clozapine. (Severe) Avidated
- SSRIs (fluvoxamine) increase the concentration of clozapine. Monitor side effects and adjust dose. (Severe) Study
- Co-trimoxazole → see sulfonamides
- Cobicistat
  - Cobicistat is predicted to increase the exposure to abiraterone.
    (Severe) Theoretical
  - Cobicistat is predicted to markedly increase the exposure to aldosterone antagonists (eplerenone). Avoid. (Severe) Study
  - Cobicistat is predicted to increase the exposure to almotriptan. (Mild) Study
  - Cobicistat is predicted to moderately increase the exposure to alpha blockers (alfuzosin, tamsulosin). Use with caution or avoid. (Moderate) Study
  - Cobicistat is predicted to increase the exposure to alpha blockers (doxazosin). (Moderate) Study
  - Cobicistat moderately increases the exposure to alprazolam. Avoid. (Moderate) Study
  - Cobicistat very markedly increases the exposure to antiarrhythmics (dronedarone). Avoid. (Severe) Study
  - Cobicistat is predicted to increase the exposure to antiarrhythmics (propafenone). Monitor and adjust dose. (Severe) Study
  - Cobicistat is predicted to increase the exposure to anticholinesterases, centrally acting (galantamine). Monitor and adjust dose. (Moderate) Study
  - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to cobicistat. Avoid. (Severe) Theoretical
  - Antiepileptics (oxcarbazepine) are predicted to decrease the concentration of cobicistat. (Severe) Theoretical
  - Cobicistat is predicted to slightly increase the exposure to antiepileptics (perampanel). (Mild) Study
  - Cobicistat is predicted to increase the exposure to antifungals, azoles (fluconazole, posaconazole). (Moderate) Theoretical
  - Cobicistat is predicted to increase the exposure to antifungals, azoles (isavuconazole). Avoid or monitor side effects. (Severe) Study
  - Cobicistat is predicted to increase the exposure to antifungals, azoles (itraconazole). Adjust itraconazole dose. (Moderate) Theoretical
  - Cobicistat is predicted to increase the exposure to antifungals, azoles (ketocnazole). Adjust ketoconazole dose. (Moderate) Theoretical
  - Cobicistat is predicted to affect the exposure to antifungals, azoles (voriconazole). Avoid. (Moderate) Theoretical
  - Cobicistat is predicted to increase the exposure to antimalarials (artemether) (with lumafantrine). (Moderate) Study
  - Cobicistat is predicted to increase the concentration of antimalarials (piperaquene). (Severe) Theoretical
  - Cobicistat is predicted to markedly increase the exposure to aprepitant. (Moderate) Study
  - Cobicistat is predicted to slightly increase the exposure to aprepitant. Adjust aprepitant dose, p. 240. (Moderate) Study
  - Cobicistat is predicted to increase the exposure to aripiprazole. Avoid or adjust dose. (Moderate) Study
  - Cobicistat is predicted to increase the exposure to bedaquiline. Avoid prolonged use. (Mild) Study
  - Cobicistat is predicted to increase the exposure to beta2 agonists (salmeterol). Avoid. (Severe) Study
  - Cobicistat slightly increases the exposure to bortezomib. (Moderate) Study
- Bosentan is predicted to decrease the exposure to cobicistat. Avoid. (Severe) Theoretical
- Cobicistat is predicted to markedly increase the exposure to bosutinib. Avoid or adjust bosutinib dose. (Severe) Study
- Cobicistat is predicted to increase the exposure to buspirone. Adjust buspirone dose. (Severe) Study
- Cobicistat slightly increases the exposure to cabozantinib. (Moderate) Study
- Cobicistat is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. (Moderate) Study
- Cobicistat is predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). (Severe) Study
- Cobicistat is predicted to markedly increase the exposure to calcium channel blockers (lercanidipine). Avoid. (Severe) Study
- Cobicistat is predicted to increase the exposure to cannabis extract. Use with caution and adjust dose. (Moderate) Theoretical
- Cobicistat is predicted to increase the exposure to ceritinib. Avoid or adjust ceritinib dose. (Severe) Study
- Cobicistat increases the concentration of ciclosporin. (Severe) Study
- Cobicistat is predicted to moderately increase the exposure to cilostazol. Adjust cilostazol dose. (Moderate) Study
- Cobicistat is predicted to moderately increase the exposure to cinacalcet. Adjust dose. (Moderate) Study
- Cobicistat is predicted to markedly increase the exposure to cobimetinib. Avoid or monitor for toxicity. (Severe) Study
- Cobicistat is predicted to increase the exposure to colchicine. Avoid or adjust colchicine dose. (Severe) Study
- Cobicistat is predicted to increase the exposure to combined hormonal contraceptives. Avoid. (Severe) Study
- Cobicistat is predicted to increase the concentration of corticosteroids (beclometasone) (risk with beclometasone is likely to be lower than with other corticosteroids). MHRA advises avoid or monitor for beclometasone side effects. (Moderate) Theoretical
- Cobicistat is predicted to increase the concentration of corticosteroids (betamethasone). MHRA advises avoid or monitor side effects and consider beclometasone as an alternative. (Severe) Theoretical
- Cobicistat is predicted to increase the concentration of corticosteroids (budesonide). MHRA advises avoid or monitor side effects and consider beclometasone as an alternative. (Severe) Theoretical
- Cobicistat is predicted to increase the exposure to corticosteroids (ciclesonide). Avoid. (Moderate) Theoretical
- Cobicistat is predicted to increase the concentration of corticosteroids (deflazacort). MHRA advises avoid or monitor side effects and consider beclometasone as an alternative. (Severe) Theoretical
- Cobicistat is predicted to increase the concentration of corticosteroids (dexamethasone). MHRA advises avoid or monitor side effects and consider beclometasone as an alternative. (Severe) Theoretical
- Cobicistat is predicted to increase the exposure to inhaled corticosteroids (fluticasone). (Severe) Study
- Cobicistat is predicted to increase the concentration of corticosteroids (hydrocortisone). MHRA advises avoid or monitor side effects and consider beclometasone as an alternative. (Severe) Theoretical
- Cobicistat potentially increases the concentration of corticosteroids (methylprednisolone). MHRA advises avoid or monitor side effects and consider beclometasone as an alternative. (Severe) Theoretical
- Cobicistat is predicted to increase the exposure to corticosteroids (prednisolone). (Severe) Study
- Cobicistat is predicted to increase the concentration of corticosteroids (prednisone). MHRA advises avoid or monitor side effects and consider beclometasone as an alternative. (Severe) Theoretical
- Cobicistat is predicted to increase the concentration of corticosteroids (triamicinolone). MHRA advises avoid or monitor side effects and consider beclometasone as an alternative. (Severe) Theoretical
- Cobicistat is predicted to moderately increase the exposure to crizotinib. Avoid. (Moderate) Study
Cobicistat is predicted to increase the exposure to dabrafenib. Use with caution or avoid. [Moderate] Study

Cobicistat is predicted to moderately increase the exposure to dactasvir. Adjust dactasvir dose. [Moderate] Study

Cobicistat is predicted to markedly to very markedly increase the exposure to darifenacin. Avoid. [Severe] Study

Cobicistat is predicted to markedly increase the exposure to dasatinib. Avoid. [Severe] Study

Cobicistat very slightly increases the exposure to delamanid. [Severe] Study

Cobicistat increases the risk of QT prolongation when given with domperidone. Avoid. [Severe] Study

Cobicistat increases the exposure to dopamine receptor agonists (bromocriptine, cabergoline). [Severe] Study

Cobicistat is predicted to increase the risk of ergotism when given with ergometrine. Avoid. [Severe] Theoretical

Efavirenz is predicted to decrease the exposure to cobicistat. Avoid. [Severe] Theoretical

Cobicistat slightly to moderately increases the exposure to elbasvir. Avoid. [Moderate] Study

Cobicistat is predicted to markedly increase the exposure to elotinib. Use with caution and adjust dose. [Moderate] Study

Enzalutamide is predicted to decrease the exposure to cobicistat. Avoid. [Severe] Theoretical

Cobicistat is predicted to increase the concentration of everolimus. Avoid. [Severe] Study

Cobicistat is predicted to moderately increase the exposure to fosoterodine. Adjust fosoterodine dose; avoid in hepatic and renal impairment. [Severe] Study

Cobicistat is predicted to increase the exposure to fosaprepitant. [Moderate] Theoretical

Cobicistat is predicted to increase the exposure to gefitinib. [Moderate] Study

Cobicistat is predicted to moderately to markedly increase the exposure to grazoprevir. Avoid. [Severe] Study

Cobicistat is predicted to increase the exposure to guanfacine. Adjust guanfacine dose. p. 222. [Moderate] Study

Cobicistat is predicted to very markedly increase the exposure to ibrutinib. Avoid or adjust ibrutinib dose. [Severe] Study

Cobicistat is predicted to increase the exposure to imatinib. [Moderate] Study

Cobicistat is predicted to increase the risk of toxicity when given with irinotecan. Avoid. [Moderate] Study

Cobicistat is predicted to increase the exposure to ivabradine. Avoid. [Severe] Study

Cobicistat is predicted to increase the exposure to ivacaftor. Adjust ivacaftor or lumacaftor with ivacaftor dose. p. 179. [Severe] Study

Cobicistat is predicted to increase the exposure to lapatinib. Avoid. [Moderate] Study

Cobicistat is predicted to markedly increase the exposure to lomitapide. Avoid. [Severe] Study

Cobicistat is predicted to increase the exposure to lurasidone. Avoid. [Severe] Study

Cobicistat is predicted to increase the exposure to macitentan. [Moderate] Study

Cobicistat markedly increases the exposure to maraviroc. Refer to specialist literature. [Severe] Study

Cobicistat is predicted to markedly to very markedly increase the exposure to midazolam. Avoid or adjust midazolam dose. [Severe] Study

Cobicistat is predicted to increase the exposure to mirabegron. Adjust mirabegron dose in hepatic and renal impairment. [Moderate] Study

Cobicistat is predicted to increase the exposure to mirtazapine. [Moderate] Study

Cobicistat is predicted to increase the exposure to modafinil. [Mild] Theoretical

Cobicistat is predicted to increase the exposure to monoclonal antibodies (trastuzumab emtansine). Avoid. [Severe] Theoretical

Cobicistat is predicted to markedly increase the exposure to naloxegol. Avoid. [Severe] Study

Cobicistat is predicted to increase the exposure to netupitant. [Mild] Study

Nevirapine is predicted to decrease the exposure to cobicistat. Avoid. [Severe] Theoretical

Cobicistat is predicted to moderately increase the exposure to nilotinib. Avoid. [Severe] Study

Cobicistat is predicted to increase the exposure to nitazoxanide. Adjust nitazoxanide dose. [Moderate] Theoretical

Cobicistat is predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose. [Moderate] Study

Cobicistat is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone, sufentanil). Monitor and adjust dose. [Severe] Study

Cobicistat is predicted to increase the exposure to opioids (methadone). [Moderate] Theoretical

Cobicistat is predicted to increase the exposure to oxybutynin. [Mild] Study

Cobicistat is predicted to increase the exposure to palbociclib. Avoid or adjust palbociclib dose. [Severe] Study

Cobicistat is predicted to increase the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid. [Moderate] Study

Cobicistat is predicted to increase the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. [Severe] Theoretical

Cobicistat is predicted to increase the exposure to pazopanib. Avoid or adjust pazopanib dose. [Moderate] Study

Cobicistat is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil, vardenafil). Avoid. [Severe] Study

Cobicistat is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Avoid or adjust sildenafil dose. p. 117. [Severe] Study

Cobicistat is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). Use with caution or avoid. [Severe] Study

Cobicistat is predicted to increase the exposure to pimozide. Avoid. [Severe] Study

Cobicistat is predicted to slightly increase the exposure to ponatinib. Monitor and adjust ponatinib dose. [Moderate] Study

Cobicistat is predicted to moderately increase the exposure to praziquantel. [Mild] Study

Cobicistat is predicted to increase the exposure to quetiapine. Avoid. [Severe] Study

Cobicistat is predicted to increase the exposure to ranolazine. Avoid. [Severe] Study

Cobicistat is predicted to increase the exposure to reboxetine. Avoid. [Moderate] Study

Cobicistat is predicted to increase the exposure to regorafenib. Avoid. [Moderate] Study

Cobicistat is predicted to increase the exposure to repaglinide. [Moderate] Study

Cobicistat is predicted to increase the exposure to retinoids (allitretinoin). Adjust allitretinoin dose. [Moderate] Theoretical

Rifabutin decreases the concentration of cobicistat and cobicistat increases the exposure to rifabutin. Avoid or adjust dose. [Severe] Study

Rifampicin is predicted to decrease the exposure to cobicistat. Avoid. [Severe] Theoretical

Cobicistat is predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study

Cobicistat is predicted to increase the exposure to ruxolitinib. Adjust dose and monitor side effects. [Moderate] Study

Cobicistat is predicted to increase the exposure to saxagliptin. [Moderate] Study

Cobicistat is predicted to increase the exposure to simeprevir. Avoid. [Severe] Study

Cobicistat is predicted to increase the concentration of sirolimus. Avoid. [Severe] Study

Cobicistat is predicted to increase the exposure to solifenacin or tamsulosin with solifenacin dose; avoid in hepatic and renal impairment. [Severe] Study
Cobicistat is predicted to moderately increase the exposure to SSRIs (dapoxetine). Avoid or adjust dapoxetine dose. **Severe** Study

**St John’s Wort** is predicted to decrease the exposure to cobicistat. **Avoid.** **Theoretical**

Cobicistat is predicted to increase the exposure to statins (atorvastatin). Avoid or adjust dose and monitor rhabdomyolysis. **Severe** Study

Cobicistat is predicted to increase the exposure to statins (simvastatin). **Avoid.** **Severe** Study

Cobicistat is predicted to slightly increase the exposure to sunutinib. Avoid or adjust sunutinib dose. **Moderate** Study

Cobicistat is predicted to increase the concentration of tacrolimus. Monitor and adjust dose. **Severe** Study

Cobicistat is predicted to increase the exposure to taxanes (docetaxel). Avoid. **Severe** Study

Cobicistat is predicted to moderately increase the exposure to taxanes (paclitaxel). Avoid or adjust dose. **Severe** Study

Cobicistat is predicted to increase the exposure to toremifene. **Moderate** **Theoretical**

Cobicistat is predicted to increase the exposure to trabectedin. Avoid or adjust dose. **Severe** **Theoretical**

Cobicistat is predicted to moderately increase the exposure to ticagrelor. **Avoid.** **Severe** Study

Cobicistat is predicted to slightly increase the exposure to tricyclic antidepressants. **Mild** Study

Cobicistat is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. **Severe** Study

Cobicistat is predicted to increase the exposure to vemurafenib. **Severe** **Theoretical**

Cobicistat is predicted to increase the exposure to venetoclax. Avoid or adjust venetoclax dose. **Severe** Study

Cobicistat is predicted to increase the exposure to venlafaxine. **Moderate** **Theoretical**

Cobicistat is predicted to increase the exposure to vinca alkaloids. **Severe** **Theoretical**

Cobicistat is predicted to increase the exposure to vitamin D substances (paricalcitol). **Moderate** Study

Cobicistat is predicted to increase the exposure to zopiclone. Adjust dose. **Moderate** **Theoretical**

**Cobimetinib**

Antiarrhythmics (dronedarone) are predicted to increase the exposure to cobimetinib. **Severe** **Theoretical**

Antiplatelets (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to cobimetinib. **Avoid.** **Severe** **Theoretical**

Antifungals, azoles (fluconazole, isavuconazole, miconazole, posaconazole) are predicted to increase the exposure to cobimetinib. **Severe** **Theoretical**

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to cobimetinib. **Avoid or monitor for toxicity.** **Severe** Study

Aprepitant is predicted to increase the exposure to cobimetinib. **Severe** **Theoretical**

Bosentan is predicted to decrease the exposure to cobimetinib. **Avoid.** **Severe** **Theoretical**

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to cobimetinib. **Severe** **Theoretical**

Cobicistat is predicted to markedly increase the exposure to cobimetinib. **Avoid or monitor for toxicity.** **Severe** Study

Cobicistat is predicted to increase the exposure to cobimetinib. **Severe** **Theoretical**

Efavirenz is predicted to decrease the exposure to cobimetinib. **Avoid.** **Severe** **Theoretical**

Enzalutamide is predicted to decrease the exposure to cobimetinib. **Avoid.** **Severe** **Theoretical**

Grapefruit juice is predicted to increase the exposure to cobimetinib. **Avoid.** **Severe** **Theoretical**

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to markedly increase the exposure to cobimetinib. Avoid or monitor for toxicity. **Severe** Study

HIV-protease inhibitors (indinavir) are predicted to increase the exposure to cobimetinib. **Severe** **Theoretical**

Idelalisib is predicted to markedly increase the exposure to cobimetinib. Avoid or monitor for toxicity. **Severe** Study

Imatinib is predicted to increase the exposure to cobimetinib. **Severe** **Theoretical**

Macrolides (clarithromycin) are predicted to increase the exposure to cobimetinib. Avoid or monitor for toxicity. **Severe** Study

Macrolides (erythromycin) are predicted to increase the exposure to cobimetinib. **Severe** **Theoretical**

Netupitant is predicted to increase the exposure to cobimetinib. **Severe** **Theoretical**

Nevirapine is predicted to decrease the exposure to cobimetinib. **Avoid.** **Severe** **Theoretical**

Nilotinib is predicted to increase the exposure to cobimetinib. **Severe** **Theoretical**

Rifampicin is predicted to decrease the exposure to cobimetinib. **Avoid.** **Severe** **Theoretical**

**St John’s Wort** is predicted to decrease the exposure to cobimetinib. **Avoid.** **Severe** **Theoretical**

**Codeine** → see opioids

**Colchicine**

Antiarhythmics (dronedarone) are predicted to increase the exposure to colchicine. Adjust colchicine dose. **Severe** Study

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to colchicine. Adjust colchicine dose. **Severe** Study

Antiarrhythmics (dronedarone) are predicted to increase the exposure to colchicine. Adjust colchicine dose. **Severe** Study

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to colchicine. Adjust colchicine dose. **Severe** Study

Cetirizine is predicted to increase the exposure to colchicine. **Severe** **Theoretical**

Ciclosporin increases the exposure to colchicine. Avoid or adjust colchicine dose. **Severe** Study

Cobicistat is predicted to increase the exposure to colchicine. **Avoid or adjust colchicine dose.** **Severe** Study

Crizotinib is predicted to increase the exposure to colchicine. **Avoid or adjust colchicine dose.** **Severe** Study

Colchicine increases the risk of rhabdomyolysis when given with fibrates. **Severe** Anecdotal

HIV-protease inhibitors (atazanavir, darunavir, posaconazole, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to colchicine. Avoid or adjust colchicine dose. **Severe** Study

HIV-protease inhibitors (indinavir) are predicted to increase the exposure to colchicine. Adjust colchicine dose. **Severe** Study

Imatinib is predicted to increase the exposure to colchicine. Adjust colchicine dose. **Severe** Study

Lapatinib is predicted to increase the exposure to colchicine. Avoid or adjust colchicine dose. **Moderate** **Theoretical**

Lumacaftor is predicted to affect the exposure to colchicine. **Moderate** **Theoretical**

Macrolides (azithromycin) are predicted to increase the exposure to colchicine. Avoid or adjust colchicine dose. **Severe** **Theoretical**

Macrolides (clarithromycin) are predicted to increase the exposure to colchicine. Avoid or adjust colchicine dose. **Severe** Study
Colchicine (continued)

- Macrolides (erythromycin) are predicted to increase the exposure to colchicine. Adjust colchicine dose. (Severe) Study

- Mirabegron is predicted to increase the exposure to colchicine. (Mild) Theoretical

- Netupitant is predicted to increase the exposure to colchicine. Adjust colchicine dose. (Severe) Study

- Nilotinib is predicted to increase the exposure to colchicine. Adjust colchicine dose. (Severe) Study

- Ranolazine is predicted to increase the exposure to colchicine. Avoid or adjust colchicine dose. (Severe) Theoretical

- Colchicine increases the risk of rhabdomyolysis when given with statins. (Severe) Anecdotal

- Velpatasvir is predicted to increase the exposure to colchicine. (Severe) Theoretical

- Vemurafenib is predicted to increase the exposure to colchicine. Adjust or avoid colchicine dose. (Severe) Theoretical

Dose reduction or avoid co-administration

colecystokinin → see vitamin D substances

colesevelam

Separation of administration

Manufacturer advises take 4 hours before, or after, other drugs.

Colestipol

Separation of administration

Manufacturer advises take other drugs at least 1 hour before, or 4 hours after, colestipol.

Colestyramine

Separation of administration

Manufacturer advises take other drugs at least 1 hour before, or 4-6 hours after, colestyramine.

Colistimethate → see TABLE 2 p. 818 (nephrotoxicity), TABLE 20 p. 822 (neuromuscular blocking effects)

- Colistimethate increases the effects of neuromuscular blocking drugs, non-depolarising. Monitor and adjust dose. (Moderate) Study → Also see TABLE 20 p. 822 (neuromuscular blocking effects)

- Colistimethate increases the effects of sugammadex. Monitor and adjust dose. (Moderate) Study → Also see TABLE 20 p. 822

Combined hormonal contraceptives

- Combined hormonal contraceptives are predicted to increase the exposure to agomelatine. (Moderate) Study

- Combined hormonal contraceptives are predicted to increase the exposure to aminophylline. Adjust dose. (Moderate) Theoretical

- Combined hormonal contraceptives are predicted to increase the exposure to anagrelide. (Moderate) Theoretical

- Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rifunamide, topiramate) are predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 474. (Severe) Study

- Combined hormonal contraceptives alter the exposure to antiepileptics (lamotrigine). Adjust lamotrigine dose. (Moderate) Study

- Aprepitant is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 474. (Severe) Study

- Bosentan is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 474. (Severe) Study

- Cobicistat is predicted to decrease the efficacy of combined hormonal contraceptives. Avoid. (Severe) Study

- Combined hormonal contraceptives increase the risk of raised liver function tests when given with dasabuvir. Avoid. (Severe) Study

- Combined hormonal contraceptives are predicted to increase the exposure to dopamine receptor agonists (ropinirole). Adjust dose. (Moderate) Study

- Efavirenz is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 474. (Severe) Study

- Combined hormonal contraceptives slightly increase the exposure to erlotinib. Monitor side effects and adjust dose. (Moderate) Study

- Fosaprepitant is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 474. (Severe) Study

- Griseofulvin potentially decreases the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 474. (Severe) Anecdotal

- HIV-protease inhibitors (atazanavir) (unboosted) increase the exposure to combined hormonal contraceptives. Adjust dose. (Severe) Study

- HIV-protease inhibitors (ritonavir) are predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 474. (Severe) Study

- Combined hormonal contraceptives are predicted to increase the risk of venous thromboembolism when given with lenalidomide. Avoid. (Severe) Theoretical

- Oral combined hormonal contraceptives slightly increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

- Combined hormonal contraceptives are predicted to increase the exposure toloxapine. Avoid. (Unknown) Theoretical

- Lumacaftor is predicted to decrease the efficacy of combined hormonal contraceptives. Use additional contraceptive precautions. (Severe) Theoretical

- Combined hormonal contraceptives are predicted to increase the exposure to melatonin. (Moderate) Theoretical

- Combined hormonal contraceptives decrease the effects of metyrapone. Avoid. (Moderate) Theoretical

- Modafinil is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 474. (Severe) Study

- Combined hormonal contraceptives slightly increase the exposure to monoamine-oxidase B inhibitors (rasagline). (Moderate) Study

- Combined hormonal contraceptives increase the exposure to monoamine-oxidase B inhibitors (selegiline). Avoid. (Severe) Study

- Nevirapine is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 474. (Severe) Study

- NSAIDs (etoricoxib) slightly increase the exposure to combined hormonal contraceptives. (Moderate) Study

- Paritaprevir (with ritonavir and ombitasvir) increases the risk of raised liver function tests when given with combined hormonal contraceptives. Avoid. (Severe) Study

- Combined hormonal contraceptives are predicted to increase the exposure to pifredine. Use with caution and adjust dose. (Moderate) Study

- Pitolisant is predicted to decrease the efficacy of combined hormonal contraceptives. Avoid. (Severe) Theoretical

- Combined hormonal contraceptives are predicted to increase the risk of venous thromboembolism when given with pomalidomide. Avoid. (Severe) Theoretical

- Rifabutin is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 474. (Severe) Study

- Rifampicin is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 474. (Severe) Study

- Combined hormonal contraceptives are predicted to increase the exposure to roflumilast. (Moderate) Theoretical

- St John’s Wort decreases the efficacy of combined hormonal contraceptives. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 474. (Severe) Anecdotal

- Sugammadex is predicted to decrease the exposure to oral combined hormonal contraceptives. Refer to patient information leaflet for missed pill advice. (Severe) Theoretical

- Combined hormonal contraceptives are predicted to increase the risk of venous thromboembolism when given with thalidomide. Avoid. (Severe) Study

- Combined hormonal contraceptives are predicted to increase the exposure to theophylline. Monitor and adjust dose. (Moderate) Theoretical
- Combined hormonal contraceptives increase the exposure to tizanidine. Avoid. [Moderate] Study

- Ulipristal is predicted to decrease the efficacy of combined hormonal contraceptives. Avoid. [Severe] Theoretical

- Combined hormonal contraceptives are predicted to increase the exposure to zolmitriptan. Adjust zolmitriptan dose. p. 280. [Moderate] Theoretical

Corticosteroids → see TABLE 17 p. 822 (reduced serum potassium)

- beclometasone • betamethasone • budesonide • ciclesonide • deflazacort • dexamethasone • fluticasone • hydrocortisone • methylprednisolone • mometasone • prednisolone • prednisone • triamcinolone

ROUTE-SPECIFIC INFORMATION Interactions do not generally apply to corticosteroids used for topical action (including inhalation) unless specified.

- Antacids are predicted to decrease the absorption of deflazacort. Separate administration by 2 hours. [Moderate] Study

- Antacids decrease the absorption of dexamethasone. [Moderate] Study

- Antiarrhythmics (dronedarone) are predicted to increase the exposure to methylprednisolone. Monitor and adjust dose. [Moderate] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to deflazacort. [Unknown] Theoretical

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to prednisone. [Mid] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to corticosteroids (budesonide, dexamethasone, methylprednisolone, prednisolone). Monitor and adjust dose. [Moderate] Study

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to methylprednisolone. Monitor and adjust dose. [Moderate] Study

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to budesonide. Avoid. [Severe] Study

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ciclesonide. Avoid. [Moderate] Theoretical

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to methylprednisolone. Monitor and adjust dose. [Moderate] Study

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to mometasone. [Moderate] Theoretical

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to mometasone. [Moderate] Theoretical

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the risk of side-effects when given with triamcinolone. [Severe] Theoretical

- Antifungals, azoles (miconazole) are predicted to increase the concentration of methylprednisolone. Monitor and adjust dose. [Moderate] Study

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to corticosteroids (dexamethasone, methylprednisolone). Monitor and adjust dose. [Moderate] Study

- Aprepitant moderately increases the exposure to dexamethasone. Monitor and adjust dose. [Moderate] Study

- Aprepitant is predicted to increase the exposure to methylprednisolone. Monitor and adjust dose. [Moderate] Study

- Corticosteroids are predicted to decrease the concentration of aspirin (high-dose) and aspirin (high-dose) increases the risk of gastrointestinal bleeding when given with corticosteroids. [Moderate] Study

- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to methylprednisolone. Monitor and adjust dose. [Moderate] Study

- Dexamethasone is predicted to decrease the concentration of caspofungin. Adjust caspofungin dose, p. 356. [Moderate] Theoretical

**Corticosteroids** are predicted to decrease the concentration of choline salicylate. [Moderate] Study

- Cobicistat is predicted to increase the concentration of beclometasone (risk with beclometasone is likely to be lower than with other corticosteroids). MHRA advises avoid or monitor for beclometasone side effects. [Moderate] Theoretical

- Cobicistat is predicted to increase the concentration of betamethasone. MHRA advises avoid or monitor side effects and consider beclometasone as an alternative. [Severe] Theoretical

- Cobicistat is predicted to increase the concentration of budesonide. MHRA advises avoid or monitor side effects and consider beclometasone as an alternative. [Severe] Theoretical

- Cobicistat is predicted to increase the concentration of deflazacort. MHRA advises avoid or monitor side effects and consider beclometasone as an alternative. [Severe] Theoretical

- Cobicistat is predicted to increase the concentration of dexamethasone. MHRA advises avoid or monitor side effects and consider beclometasone as an alternative. [Severe] Theoretical

- Cobicistat is predicted to increase the concentration to hydrocortisone. MHRA advises avoid or monitor side effects and consider beclometasone as an alternative. [Severe] Theoretical

- Cobicistat potentially increases the concentration of methylprednisolone. MHRA advises avoid or monitor side effects and consider beclometasone as an alternative. [Severe] Theoretical

- Cobicistat is predicted to increase the exposure to mometasone. [Moderate] Theoretical

- Cobicistat is predicted to increase the concentration of prednisolone. MHRA advises avoid or monitor side effects and consider beclometasone as an alternative. [Severe] Theoretical

- Cobicistat is predicted to increase the concentration of triamcinolone. MHRA advises avoid or monitor side effects and consider beclometasone as an alternative. [Severe] Theoretical

- Corticosteroids are predicted to increase the effects of coumarins. [Moderate] Study

- Crizotinib is predicted to increase the exposure to methylprednisolone. Monitor and adjust dose. [Moderate] Study

- Enalizumab is predicted to decrease the exposure to corticosteroids (budesonide, dexamethasone, methylprednisolone, prednisolone). Monitor and adjust dose. [Moderate] Study

- Enalizumab is predicted to decrease the exposure to fluticasone. [Unknown] Theoretical

- Enalizumab is predicted to decrease the exposure to prednisolone. [Mid] Study

- Corticosteroids increase the risk of gastrointestinal perforation when given with erlotinib. [Severe] Theoretical

- Fosapreplantan is predicted to increase the exposure to corticosteroids (dexamethasone, methylprednisolone). Monitor and adjust dose. [Moderate] Theoretical

- Grapefruit juice moderately increases the exposure to oral budesonide. Avoid. [Moderate] Study

- Corticosteroids are predicted to decrease the effects of histamine. Avoid. [Severe] Theoretical

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to ciclesonide. Avoid. [Moderate] Theoretical

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to inhaled fluticasone. [Severe] Theoretical

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to methylprednisolone. [Moderate] Theoretical
Corticosteroids (continued)  
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, saquinavir, tipranavir) are predicted to increase the exposure to budesonide. Avoid. [Severe] Study  
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, saquinavir, tipranavir) are predicted to increase the risk of side-effects when given with triamcinolone. [Severe] Theoretical  
- HIV-protease inhibitors (indinavir) are predicted to increase the exposure to methylprednisolone. Monitor and adjust dose. [Moderate] Study  
- HIV-protease inhibitors (ritonavir) are predicted to increase the concentration of beclometasone (risk with beclometasone is likely to be lower than with other corticosteroids). MHRA advises avoid or monitor for beclometasone side effects. [Moderate] Theoretical  
- HIV-protease inhibitors (ritonavir) are predicted to increase the concentration of corticosteroids (betamethasone, budesonide, deflazacort, dexamethasone, hydrocortisone, methylprednisolone, prednisolone, prednisone, triamcinolone). MHRA advises avoid or monitor side effects and consider beclometasone as an alternative. [Severe] Theoretical  
- Idelalisib is predicted to increase the exposure to budesonide. Avoid. [Severe] Study  
- Idelalisib is predicted to increase the exposure to ciclesonide. Avoid. [Moderate] Theoretical  
- Idelalisib is predicted to increase the exposure to corticosteroids (dexamethasone, methylprednisolone). Monitor and adjust dose. [Moderate] Study  
- Idelalisib is predicted to increase the exposure to inhaled fluticasone. [Severe] Study  
- Idelalisib is predicted to increase the exposure to mometasone. [Moderate] Theoretical  
- Idelalisib is predicted to increase the risk of side-effects when given with triamcinolone. [Severe] Theoretical  
- Imitinib is predicted to increase the exposure to methylprednisolone. Monitor and adjust dose. [Moderate] Study  
- Corticosteroids are predicted to increase the risk of gastrointestinal bleeding when given with iron chelators (deferasirox). [Severe] Theoretical  
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with corticosteroids (high-dose). Public Health England advises avoid. [Severe] Theoretical  
- Lumacaftor is predicted to decrease the exposure to corticosteroids (methylprednisolone, prednisone). Adjust dose. [Severe] Theoretical  
- Macrolides (clarithromycin) are predicted to increase the exposure to budesonide. Avoid. [Severe] Study  
- Macrolides (clarithromycin) are predicted to increase the exposure to ciclesonide. Avoid. [Moderate] Theoretical  
- Macrolides (clarithromycin) are predicted to increase the exposure to inhaled fluticasone. [Severe] Study  
- Macrolides (clarithromycin) are predicted to increase the exposure to mometasone. [Moderate] Theoretical  
- Macrolides (clarithromycin) are predicted to increase the risk of side-effects when given with triamcinolone. [Severe] Theoretical  
- Macrolides (erythromycin) are predicted to increase the exposure to methylprednisolone. Monitor and adjust dose. [Moderate] Study  
- Macrolides (clarithromycin) are predicted to increase the exposure to corticosteroids (dexamethasone, methylprednisolone). Monitor and adjust dose. [Moderate] Study  
- Corticosteroids are predicted to decrease the efficacy of mifamurtide. Avoid. [Severe] Theoretical  
- Milipristone is predicted to decrease the efficacy of corticosteroids. Use with caution and adjust dose. [Moderate] Theoretical  
- Netupitant increases the exposure to dexamethasone. Adjust dose. [Moderate] Study  
- Netupitant is predicted to increase the exposure to methylprednisolone. Monitor and adjust dose. [Moderate] Study  
- Corticosteroids are predicted to decrease the effects of neuromuscular blocking drugs, non-depolarising. [Severe] Anecdotal  
- Corticosteroids increase the risk of gastrointestinal perforation when given with nicorandil. [Severe] Anecdotal  
- Nilotinib is predicted to increase the exposure to methylprednisolone. Monitor and adjust dose. [Moderate] Study  
- NSAIDs increase the risk of gastrointestinal bleeding when given with corticosteroids. [Severe] Study  
- Corticosteroids are predicted to increase the effects of phenindione. [Moderate] Anecdotal  
- Dexamethasone decreases the exposure to praziquantel. [Moderate] Study  
- Rifampicin is predicted to decrease the exposure to corticosteroids (budesonide, dexamethasone, methylprednisolone, prednisolone). Monitor and adjust dose. [Moderate] Study  
- Rifampicin is predicted to decrease the exposure to methylprednisolone. [Unknown] Theoretical  
- Rifampicin is predicted to decrease the exposure to praziquantel. [Unknown] Theoretical  
- Corticosteroids potentially decrease the effects of sodium phenytoin. [Moderate] Anecdotal  
- Corticosteroids are predicted to decrease the effects of somatropin. [Moderate] Theoretical  
- Corticosteroids are predicted to decrease the effects of suxamethonium. [Severe] Anecdotal

<tr>
<td><strong>FOOD AND LIFESTYLE</strong></td>
<td>The effects of coumarins can be reduced or abolished by vitamin K, including that found in health foods, food supplements, enteral feeds, or large amounts of some green vegetables or green tea. Major changes in diet (especially involving salads and vegetables) and in alcohol consumption can affect anticoagulant control. Pomegranate is predicted to increase the INR in response to acenocoumarol and warfarin.</td>

</table>
Cabozantinib is predicted to increase the risk of bleeding events when given with coumarins. **Severe** Theoretical

Capeceatinone increases the effects of coumarins. Monitor INR and adjust dose. **Moderate** Anecdotal

Cephalosporins (ceftiraxone) potentially increase the risk of bleeding events when given with coumarins. **Severe** Anecdotal

Ceritinib is predicted to increase the exposure to warfarin. Avoid. **Severe** Theoretical

Chloramphenicol potentially increases the anticoagulant effect of coumarins. **Moderate** Anecdotal

Corticosteroids are predicted to increase the effects of coumarins. **Moderate** Study

Cranberry juice potentially increases the anticoagulant effect of warfarin. Avoid. **Severe** Anecdotal

Crizotinib is predicted to increase the risk of bleeding events when given with coumarins. **Severe** Theoretical

Dabrafenib is predicted to decrease the anticoagulant effect of coumarins. **Severe** Theoretical

Danazol potentially increases the anticoagulant effect of coumarins. **Severe** Anecdotal

Dasatinib is predicted to increase the risk of bleeding events when given with coumarins. **Severe** Theoretical

Disulfiram increases the anticoagulant effect of coumarins. Monitor and adjust dose. **Severe** Study

Efavirenz is predicted to affect the concentration of coumarins. Adjust dose. **Moderate** Theoretical

Elvitegravir is predicted to decrease the anticoagulant effect of coumarins. **Moderate** Theoretical

Enteral feeds (vitamin-K containing) potentially decreases the anticoagulant effect of coumarins. **Severe** Anecdotal

Enzalutamide potentially decreases the exposure to coumarins. Avoid or adjust dose and monitor INR. **Severe** Study

Erlotinib increases the anticoagulant effect of coumarins. **Severe** Anecdotal

Etravirine increases the anticoagulant effect of coumarins. **Moderate** Theoretical

Fibrates are predicted to increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. **Severe** Study

Fluorouracil increases the anticoagulant effect of coumarins. **Severe** Anecdotal

Fosaprepitant is predicted to decrease the anticoagulant effect of coumarins. **Moderate** Theoretical

Gefitinib is predicted to increase the anticoagulant effect of coumarins. **Severe** Anecdotal

Glucagon increases the anticoagulant effect of warfarin. **Severe** Study

Glucosamine increases the anticoagulant effect of warfarin. Avoid. **Moderate** Anecdotal

Griseofulvin potentially decreases the anticoagulant effect of coumarins. **Moderate** Anecdotal

H₁ receptor antagonists (cimetidine) increase the anticoagulant effect of coumarins. **Severe** Study

HIV-protease inhibitors are predicted to affect the anticoagulant effect of coumarins. **Moderate** Study

Imatinib is predicted to increase the risk of bleeding events when given with coumarins. **Severe** Theoretical

Ivacaftor is predicted to increase the anticoagulant effect of warfarin. **Severe** Theoretical

Ivermectin potentially increases the anticoagulant effect of coumarins. **Severe** Anecdotal

Lapatinib is predicted to increase the risk of bleeding events when given with coumarins. **Severe** Theoretical

Leflunomide increases the anticoagulant effect of coumarins. **Severe** Anecdotal

Live vaccines (influenza vaccine) potentially increase the risk of bleeding events when given with coumarins. **Severe** Anecdotal

Lomitapide increases the exposure to warfarin. Monitor INR and adjust warfarin dose. **Severe** Study

Lumacaftor is predicted to affect the exposure to warfarin. **Severe** Theoretical

Macrolides (clarithromycin, erythromycin) increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. **Severe** Anecdotal

Mercaptopurine decreases the anticoagulant effect of coumarins. **Moderate** Anecdotal

Metronidazole increases the anticoagulant effect of coumarins. Monitor INR and adjust dose. **Severe** Study

Monoclonal antibodies (blinatumomab) are predicted to transiently increase the exposure to warfarin. Monitor and adjust dose. **Moderate** Theoretical

Nandrolone is predicted to increase the anticoagulant effect of coumarins. Monitor and adjust dose. **Severe** Theoretical

Nevirapine potentially alters the anticoagulant effect of coumarins. **Severe** Anecdotal

Nilotinib is predicted to increase the risk of bleeding events when given with coumarins. **Severe** Theoretical

Oxymetholone increases the anticoagulant effect of coumarins. **Severe** Anecdotal

Paracetamol increases the anticoagulant effect of coumarins. **Severe** Study

Pazopanib is predicted to increase the risk of bleeding events when given with coumarins. **Severe** Theoretical

Penicillins potentially alter the anticoagulant effect of coumarins. Monitor INR and adjust dose. **Severe** Anecdotal

Pitolisant is predicted to decrease the exposure to warfarin. **Unknown** Theoretical

Ponatinib is predicted to increase the risk of bleeding events when given with coumarins. **Severe** Theoretical

Quinolones increase the anticoagulant effect of coumarins. **Severe** Study

Ranibizumab increases the risk of bleeding events when given with coumarins. **Severe** Theoretical

Regorafenib is predicted to increase the risk of bleeding events when given with coumarins. **Severe** Study

Rifaximin decreases the anticoagulant effect of coumarins. **Severe** Study

Ruxolitinib is predicted to increase the risk of bleeding events when given with coumarins. **Severe** Theoretical

Sorafenib increases the anticoagulant effect of coumarins. **Severe** Anecdotal

St John’s Wort decreases the anticoagulant effect of coumarins. Avoid. **Severe** Anecdotal

Statins (fluvastatin, rosuvastatin) increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. **Severe** Study

Sucralfate potentially decreases the effects of warfarin. Separate administration by 2 hours. **Moderate** Anecdotal

Sulfamethoxazole increases the anticoagulant effect of coumarins. **Severe** Study

Sulfapyrazine increases the anticoagulant effect of coumarins. Avoid. **Severe** Study

Sulfonamides (sulfadiazine) are predicted to increase the anticoagulant effect of coumarins. **Severe** Study

Sunitinib is predicted to increase the risk of bleeding events when given with coumarins. **Severe** Theoretical

Tamoxifen increases the anticoagulant effect of coumarins. **Severe** Study

Tegafur increases the anticoagulant effect of coumarins. **Severe** Anecdotal

Theoretical

Cranberry juice potentially increases the anticoagulant effect of coumarins (warfarin). Avoid. **Severe** Anecdotal

Crisantaspase ➔ see TABLE 1. p. 818 (hepatotoxicity), TABLE 15 p. 821 (myelosuppression)

Crisantaspase is predicted to increase the risk of hepatotoxicity when given with imatinib. **Severe** Theoretical

Also see TABLE 15 p. 821

Cranberry juice
Crizotinib is predicted to increase the exposure to aldosterone antagonists (eplerenone). Adjust eplerenone dose. 

Crizotinib is predicted to increase the exposure to alpha blockers (tamsulosin). 

Crizotinib is predicted to increase the exposure to alprazolam. 

Crizotinib is predicted to increase the exposure to antiarrhythmics (propafenone). Monitor and adjust dose. 

Crizotinib is predicted to increase the exposure to antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to crizotinib. Avoid. 

Crizotinib is predicted to increase the exposure to antihistamines, non-sedating (mizolastine). 

Crizotinib is predicted to increase the concentration of antimalarials (piperaquine). 

Aprepitant is predicted to increase the exposure to crizotinib. 

Crizotinib is predicted to increase the exposure to axitinib. 

Crizotinib is predicted to increase the exposure to bedaquiline. Avoid prolonged use. 

Bosentan is predicted to decrease the exposure to crizotinib. 

Crizotinib is predicted to increase the exposure to bosutinib. Avoid or adjust bosutinib dose. 

Crizotinib is predicted to increase the exposure to buspirone. Use with caution and adjust dose. 

Crizotinib is predicted to increase the exposure to cabozantinib. 

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to crizotinib. 

Crizotinib is predicted to increase the exposure to colchicine. 

Crizotinib increases the concentration of ciclosporin. 

Cobicistat is predicted to moderately increase the exposure to crizotinib. 

Crizotinib is predicted to increase the exposure to cobimetinib. 

Crizotinib is predicted to increase the exposure to clociceline. Adjust clociceline dose. 

Crizotinib is predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. 

Crizotinib is predicted to increase the risk of bleeding events when given with coumarins. 

Crizotinib is predicted to slightly increase the exposure to darifenacin. 

Crizotinib is predicted to increase the exposure to dasatinib. 

Crizotinib increases the risk of QT-prolongation when given with domperidone. Avoid. 

Crizotinib is predicted to increase the exposure to dopamine receptor agonists (bromocriptine, cabergolime). 

Crizotinib is predicted to moderately increase the exposure to dutasteride. 

Efavirenz is predicted to decrease the exposure to crizotinib. Avoid. 

Enzalutamide is predicted to markedly decrease the exposure to crizotinib. Avoid. 

Crizotinib is predicted to increase the risk of ergotism when given with ergometrine. 

Crizotinib is predicted to increase the risk of ergotism when given with ergotamine. 

Crizotinib is predicted to increase the exposure to erlotinib. 

Crizotinib is predicted to increase the concentration of everolimus. Avoid or adjust dose. 

Crizotinib is predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose in hepatic and renal impairment. 

Crizotinib is predicted to increase the exposure to gefitinib. 

Grapefruit juice is predicted to increase the exposure to crizotinib. 

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to moderately increase the exposure to crizotinib. 

HIV-protease inhibitors (indinavir) are predicted to increase the exposure to crizotinib. 

Crizotinib is predicted to increase the exposure to lomiptamide. Avoid. 

Crizotinib is predicted to increase the exposure to lurasidone. 

Macrolides (clarithromycin) are predicted to moderately increase the exposure to crizotinib. 

Macrolides (erythromycin) are predicted to increase the exposure to crizotinib. 

Crizotinib is predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. 

Crizotinib is predicted to increase the exposure to naloxegol. Adjust naloxegol dose and monitor side effects. 

Netupitant is predicted to increase the exposure to crizotinib. 

Newiparine is predicted to decrease the exposure to crizotinib. 

Crizotinib is predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose. 

Crizotinib is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose.
Crizotinib is predicted to increase the exposure to opioids (methadone, sufentanil). [Moderate] Theoretical → Also see TABLE 6 p. 819 → Also see TABLE 9 p. 820

Crizotinib is predicted to increase the exposure to oxbutynin. [Mild] Theoretical

Crizotinib is predicted to increase the exposure to pazopanib. [Moderate] Theoretical → Also see TABLE 15 p. 821 → Also see TABLE 9 p. 820

Crizotinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical

Crizotinib is predicted to increase the exposure to phosphodiesterase type 5 inhibitors (avanafil). Adjust avanafil dose. [Moderate] Theoretical

Crizotinib is predicted to increase the exposure to phosphodiesterase type 5 inhibitors (sildenafil). Monitor and adjust sildenafil dose. [Moderate] Study → Also see TABLE 9 p. 820

Crizotinib is predicted to increase the exposure to phosphodiesterase type 5 inhibitors (tadalafil). [Severe] Theoretical → Also see TABLE 9 p. 820

Crizotinib is predicted to increase the exposure to phosphodiesterase type 5 inhibitors (vardenafil). Adjust dose. [Severe] Theoretical → Also see TABLE 9 p. 820

Crizotinib is predicted to increase the exposure to pimozone. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 820

Crizotinib is predicted to decrease the exposure to ruxolitinib. [Moderate] Theoretical → Also see TABLE 15 p. 821

Crizotinib is predicted to increase the exposure to saxaglitin. [Mild] Study

Crizotinib is predicted to increase the exposure to quetiapine. Avoid. [Moderate] Study

Crizotinib is predicted to increase the exposure to ranolazine. [Severe] Study → Also see TABLE 9 p. 820

Rifampicin is predicted to markedly decrease the exposure to crizotinib. Avoid. [Severe] Study

Crizotinib is predicted to increase the exposure to rufoxitinib. [Moderate] Theoretical → Also see TABLE 15 p. 821

Crizotinib is predicted to increase the exposure to saxaglitin. [Mild] Study

Crizotinib is predicted to increase the exposure to simprevir. Avoid. [Severe] Study

Crizotinib increases the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study

Crizotinib is predicted to increase the exposure to SSRIs (dapoxetine). Adjust dapoxetine dose. [Moderate] Theoretical

St John's Wort is predicted to decrease the exposure to crizotinib. Avoid. [Severe] Theoretical

Crizotinib is predicted to increase the exposure to statins (atorvastatin). Monitor and adjust dose. [Severe] Theoretical

Crizotinib is predicted to increase the exposure to statins (simvastatin). Use with caution and adjust simvastatin dose, p.130. [Severe] Study

Crizotinib is predicted to increase the exposure to sunitinib. [Moderate] Theoretical → Also see TABLE 15 p. 821 → Also see TABLE 9 p. 820

Crizotinib is predicted to increase the concentration of tacrolimus. [Severe] Study

Crizotinib is predicted to increase the exposure to taxanes (cabazitaxel). [Moderate] Theoretical → Also see TABLE 15 p. 821

Crizotinib is predicted to increase the concentration of temsirolimus. [Moderate] Theoretical → Also see TABLE 15 p. 821

Crizotinib is predicted to increase the exposure to tolterodine. [Mild] Theoretical → Also see TABLE 9 p. 820

Crizotinib is predicted to increase the exposure to tolvaptan. Adjust dose. [Moderate] Theoretical

Crizotinib is predicted to increase the exposure to trazodone. [Moderate] Theoretical

Crizotinib is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Moderate] Study

Crizotinib is predicted to increase the exposure to venetoclax. Avoid or adjust venetoclax dose. [Severe] Study

Crizotinib is predicted to increase the exposure to vincas alkaloids. [Severe] Theoretical → Also see TABLE 9 p. 820 → Also see TABLE 15 p. 821

Crizotinib is predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Study

Cyclazine → see antihistamines, sedating

Cyclopenthiazide → see thiazide diuretics

Cyclopentolate → see TABLE 10 p. 820 (antimuscarinics)

Cyclophosphamide → see alkylating agents

Cycloserine

Cycloserine increases the risk of CNS toxicity when given with isoniazid. Monitor and adjust dose. [Moderate] Study

Cytoheptadine → see antihistamines, sedating

Cytrabine decreases the concentration of flucytosine. Avoid. [Severe] Study

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with cytarabine. Public Health England avoids. Avoid. [Severe] Theoretical

Dabigatran → see TABLE 3 p. 818 (anticoagulant effects)

Antiarrhythmics (amiodarone) are predicted to increase the exposure to dabigatran. Adjust dabigatran dose. [Moderate] Study

Antiarrhythmics (dronedarone) slightly increase the exposure to dabigatran. Avoid. [Severe] Study

Antiepileptics (carbamazepine) are predicted to decrease the exposure to dabigatran. Avoid. [Severe] Study

Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the exposure to dabigatran. Avoid. [Severe] Study

Calcium channel blockers (verapamil) increase the exposure to dabigatran. Adjust dabigatran dose. [Severe] Study

Ceritinib is predicted to increase the exposure to dabigatran. [Moderate] Theoretical

Ciclosporin is predicted to increase the exposure to dabigatran. Avoid. [Severe] Theoretical

Elbasvir is predicted to increase the concentration of dabigatran. [Moderate] Theoretical

HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the exposure to dabigatran. Avoid. [Severe] Study

Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the exposure to dabigatran. Avoid. [Severe] Study

Calcium channel blockers (verapamil) increase the exposure to dabigatran. Adjust dabigatran dose. [Severe] Study

Lumacaftor is predicted to affect the exposure to dabigatran. Monitor and adjust dose. [Moderate] Theoretical

Macrolides (azithromycin, clarithromycin, erythromycin) are predicted to increase the exposure to dabigatran. [Moderate] Theoretical

Mirabegron is predicted to increase the exposure to dabigatran. [Severe] Theoretical

Temsirolimus (radiphosphoinositide 3-kinase inhibitors, phosphoinositide 3-kinase inhibitors) are predicted to increase the exposure to dabigatran. [Moderate] Theoretical

Venurafenib increases the exposure to dabigatran. Use with caution and adjust dose. [Severe] Theoretical

Dabrafenib → see TABLE 15 p. 821 (myelosuppression)

Antacids are predicted to decrease the absorption of dabrafenib. Avoid. [Severe] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to dabrafenib. Avoid. [Moderate] Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to dabrafenib. Use with caution or avoid. [Moderate] Study

Cobicistat is predicted to increase the exposure to dabrafenib. Use with caution or avoid. [Moderate] Study

Dabrafenib is predicted to decrease the anticoagulant effect of coumarins. [Severe] Theoretical

Enzalutamide is predicted to decrease the exposure to dabrafenib. Avoid. [Moderate] Theoretical

Fibates (gemfibrozil) are predicted to increase the exposure to dabrafenib. [Moderate] Theoretical

H₂ receptor antagonists are predicted to decrease the exposure to dabrafenib. Avoid. [Severe] Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to...
Dabrafenib (continued) increase the exposure to dabrafenib. Use with caution or avoid. [Moderate] Study

- Idelalisib is predicted to increase the exposure to dabrafenib. Use with caution or avoid. [Moderate] Study  → Also see TABLE 15 p. 821
- Macrolides (clarithromycin) are predicted to increase the exposure to dabrafenib. Use with caution or avoid. [Moderate] Study
- Dabrafenib decreases the exposure to midazolam. Monitor and adjust dose. [Moderate] Study
- Proton pump inhibitors are predicted to decrease the exposure to dabrafenib. Avoid. [Severe] Theoretical
- Rifampicin is predicted to decrease the exposure to dabrafenib. Avoid. [Moderate] Theoretical
- Dacarbazine  → see alkylating agents

Daclatasvir

- Daclatasvir is predicted to increase the risk of severe bradycardia or heart block when given with antiarrhythmics (amiodarone). Refer to specialist literature. [Severe] Anecdotal
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to daclatasvir. Avoid. [Severe] Study
- Antiepileptics (oxcarbazepine) are predicted to decrease the exposure to daclatasvir. Avoid. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to daclatasvir. Adjust daclatasvir dose. [Moderate] Study
- Bosantan is predicted to decrease the exposure to daclatasvir. Adjust daclatasvir dose. [Moderate] Theoretical
- Cobicistat is predicted to moderately decrease the exposure to daclatasvir. Adjust daclatasvir dose. [Moderate] Study
- Daclatasvir slightly increases the concentration of digoxin. [Severe] Study
- Efavirenz is predicted to decrease the exposure to daclatasvir. Adjust dose. [Severe] Study
- Enzalutamide is predicted to moderately decrease the exposure to daclatasvir. Avoid. [Severe] Study
- Etravirine is predicted to decrease the exposure to daclatasvir. Avoid. [Moderate] Theoretical
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to moderately increase the exposure to daclatasvir. Adjust daclatasvir dose. [Moderate] Study
- Idelalisib is predicted to moderately increase the exposure to daclatasvir. Adjust daclatasvir dose. [Moderate] Study
- Macrolides (clarithromycin) are predicted to moderately increase the exposure to daclatasvir. Adjust daclatasvir dose. [Moderate] Study
- Nevirapine is predicted to decrease the exposure to daclatasvir. Avoid. [Severe] Theoretical
- St John’s Wort is predicted to decrease the exposure to daclatasvir. Avoid. [Severe] Theoretical

Daclizumab  → see monoclonal antibodies

Dactinomycin  → see TABLE 1 p. 818 (hepatotoxicity), TABLE 15 p. 821 (myelosuppression)
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with dactinomycin. Public Health England advises avoid. [Severe] Theoretical

Dairy products

- Dairy products are predicted to decrease the absorption of eltrombopag. Ertombopag should be taken 2 hours before or 4 hours after dairy products. [Severe] Theoretical
- Dairy products decreases the exposure to tetracyclines (demeclocycline, oxytetracycline, tetracycline). Avoid. [Moderate] Study

Dalteparin  → see low molecular-weight heparins

Danaparoid  → see TABLE 3 p. 818 (anticoagulant effects)
- Ranibizumab is predicted to increase the risk of bleeding events when given with danaparoid. [Severe] Theoretical

Danazol

- Danazol moderately increases the concentration of antiepileptics (carbamazepine). Monitor carbamazepine concentration and adjust dose. [Severe] Study
- Danazol increases the concentration of ciclosporin. [Severe] Study
- Danazol potentially increases the anticoagulant effect of coumarins. [Severe] Anecdotal
- Danazol is predicted to increase the risk of rhabdomyolysis when given with statins (atorvastatin). [Severe] Theoretical
- Danazol increases the risk of rhabdomyolysis when given with statins (simvastatin). Avoid. [Severe] Anecdotal
- Danazol potentially increases the concentration of tacrolimus. [Severe] Anecdotal

Dantrolene  → see TABLE 1 p. 818 (hepatotoxicity)

Dapagliflozin  → see TABLE 14 p. 821 (antidiabetic drugs), TABLE 8 p. 819 (hypotension)

Dapoxetine  → see SSRIs

Dapsonae (aminosalicylic acid) is predicted to increase the risk of methaemoglobinaemia when given with dapsona. [Severe] Theoretical

- Dapsona is predicted to increase the risk of methaemoglobinaemia when given with topical anaesthetics, local (prilocaine). Use with caution or avoid. [Severe] Theoretical
- Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to increase the risk of methaemoglobinaemia when given with dapsona. [Severe] Theoretical

- Antimalarias (chloroquine, primaquine) are predicted to increase the risk of methaemoglobinaemia when given with dapsona. [Severe] Theoretical
- Nitrazine are predicted to increase the risk of methaemoglobinaemia when given with dapsona. [Severe] Theoretical
- Nitrofurantoin is predicted to increase the risk of methaemoglobinaemia when given with dapsona. [Severe] Theoretical

- Paracetamol is predicted to increase the risk of methaemoglobinaemia when given with dapsona. [Severe] Theoretical
- Rifabutin increases the clearance of dapsona. [Moderate] Study
- Rifampicin moderately decreases the exposure to dapsona. [Moderate] Study

- Sodium nitroprusside is predicted to increase the risk of methaemoglobinaemia when given with dapsona. [Severe] Theoretical

- Sulfonamides are predicted to increase the risk of methaemoglobinaemia when given with dapsona. [Severe] Theoretical

- Dapsona increases the exposure to trimethoprim and trimethoprim increases the exposure to dapsona. [Severe] Study

Daptomycin

- Aspirin (high-dose) increases the risk of renal impairment when given with daptomycin. [Moderate] Theoretical
- Ciclosporin is predicted to increase the risk of rhabdomyolysis when given with daptomycin. [Severe] Theoretical
- Fibrates are predicted to increase the risk of rhabdomyolysis when given with daptomycin. [Severe] Theoretical
- NSAIDs are predicted to increase the risk of renal impairment when given with daptomycin. [Moderate] Theoretical
- Statins are predicted to increase the risk of rhabdomyolysis when given with daptomycin. [Severe] Theoretical

Daratumumab  → see monoclonal antibodies

Darbepeotin alfa  → see TABLE 5 p. 818 (thromboembolism), TABLE 16 p. 822 (increased serum potassium)

Darifenacin  → see TABLE 10 p. 820 (antimuscarinics)

- Antiarhytmics (dronedaron) are predicted to slightly increase the exposure to darifenacin. [Moderate] Study
Darifenacin is predicted to increase the concentration of antiarrhythmics (flecainide). [Moderate] Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to darifenacin. [Moderate] Theoretical

Antifungals, azoles (fluconazole, itraconazole, posaconazole) are predicted to markedly increase the exposure to darifenacin. [Moderate] Study

Calcium channel blockers (diltiazem, verapamil) are predicted to slightly increase the exposure to darifenacin. [Moderate] Study

Grapefruit juice is predicted to increase the exposure to darifenacin. [Mild] Study

Cinacalcet is predicted to slightly increase the exposure to darifenacin. [Mild] Study

Cobicistat is predicted to markedly increase the exposure to darifenacin. [Mild] Study

Crizotinib is predicted to increase the exposure to darifenacin. [Moderate] Study

Enzalutamide is predicted to increase the exposure to darifenacin. [Mild] Study

Grapefruit juice is predicted to increase the exposure to darifenacin. [Mild] Study

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to darifenacin. [Mild] Study

Idelalisib is predicted to markedly increase the exposure to darifenacin. [Severe] Study

Imatinib is predicted to increase the exposure to darifenacin. [Mild] Study

Macrolides (clarithromycin) are predicted to markedly increase the exposure to darifenacin. [Mild] Study

Macrolides (erythromycin) are predicted to increase the exposure to darifenacin. [Mild] Study

Netupitant is predicted to increase the exposure to darifenacin. [Mild] Study

Nilotinib is predicted to increase the exposure to darifenacin. [Mild] Study

Rifampicin is predicted to decrease the exposure to darifenacin. [Mild] Study

St John’s Wort is predicted to decrease the exposure to darasuvir. Avoid. [Severe] Theoretical

St John’s Wort is predicted to decrease the exposure to dasabuvir. Avoid. [Severe] Theoretical

Dasabuvir increases the exposure to statins (rosuvastatin). Adjust rosuvastatin dose, p. 130. [Moderate] Study

Dasatinib → see TABLE 15 p. 821 (myelosuppression), TABLE 9 p. 820 (QT-interval prolongation), TABLE E 4 p. 818 (antiplatelet effects)

Antacids decrease the absorption of dasabuvir. Separate administration by at least 2 hours. [Moderate] Study

Antidiarrhoeals (dronedarone) are predicted to decrease the exposure to dasabuvir. Avoid. [Severe] Study → Also see TABLE 9 p. 820

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to dasabuvir. Avoid. [Severe] Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to dasabuvir. Avoid. [Severe] Study

Aprepitant is predicted to increase the exposure to dasabuvir. Avoid. [Severe] Study

Aprepitant is predicted to increase the exposure to dasabuvir. Avoid. [Severe] Study

Bupropion increases the concentration of loop diuretics (furosemide). Adjust dose. [Moderate] Study

Darifenacin is predicted to decrease the exposure to dasabuvir. Avoid. [Severe] Theoretical

Darifenacin is predicted to decrease the exposure to dasbuvir. Avoid. [Severe] Theoretical

Dasatinib is predicted to increase the exposure to statins (rosuvastatin). Adjust rosuvastatin dose, p. 130. [Moderate] Study

Dasatinib → see TABLE 15 p. 821 (myelosuppression), TABLE 9 p. 820 (QT-interval prolongation), TABLE E 4 p. 818 (antiplatelet effects)

Antacids decrease the absorption of dasabuvir. Separate administration by at least 2 hours. [Moderate] Study

Antidiarrhoeals (dronedarone) are predicted to decrease the exposure to dasabuvir. Avoid. [Severe] Study → Also see TABLE 9 p. 820

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to dasabuvir. Avoid. [Severe] Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to dasabuvir. Avoid. [Severe] Study

Aprepitant is predicted to increase the exposure to dasabuvir. Avoid. [Severe] Study

Aprepitant is predicted to increase the exposure to dasabuvir. Avoid. [Severe] Study

Bupropion increases the concentration of loop diuretics (furosemide). Adjust dose. [Moderate] Study

Darifenacin is predicted to decrease the exposure to dasabuvir. Avoid. [Severe] Theoretical

Darifenacin is predicted to decrease the exposure to dasbuvir. Avoid. [Severe] Theoretical

Dasatinib is predicted to increase the exposure to statins (rosuvastatin). Adjust rosuvastatin dose, p. 130. [Moderate] Study

Dasatinib → see TABLE 15 p. 821 (myelosuppression), TABLE 9 p. 820 (QT-interval prolongation), TABLE E 4 p. 818 (antiplatelet effects)

Antacids decrease the absorption of dasabuvir. Separate administration by at least 2 hours. [Moderate] Study

Antidiarrhoeals (dronedarone) are predicted to decrease the exposure to dasabuvir. Avoid. [Severe] Study → Also see TABLE 9 p. 820

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to dasabuvir. Avoid. [Severe] Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to dasabuvir. Avoid. [Severe] Study

Aprepitant is predicted to increase the exposure to dasabuvir. Avoid. [Severe] Study

Aprepitant is predicted to increase the exposure to dasabuvir. Avoid. [Severe] Study

Bupropion increases the concentration of loop diuretics (furosemide). Adjust dose. [Moderate] Study

Darifenacin is predicted to decrease the exposure to dasabuvir. Avoid. [Severe] Theoretical

Darifenacin is predicted to decrease the exposure to dasbuvir. Avoid. [Severe] Theoretical

Dasatinib is predicted to increase the exposure to statins (rosuvastatin). Adjust rosuvastatin dose, p. 130. [Moderate] Study
Deferiprone  
- See Table 15 p. 821 (myelosuppression)
- Antacids (aluminium hydroxide) are predicted to decrease the absorption of deferiprone. Avoid. [Moderate] Theoretical
- Ascorbic acid is predicted to increase the risk of cardiovascular side-effects when given with deferiprone. [Severe] Theoretical
- Diflazacort  
- See corticosteroids
- Delamanid  
- See Table 9 p. 820 (QT-interval prolongation)
- Antiiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to slightly decrease the exposure to delamanid. Avoid. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) very slightly increase the exposure to delamanid. [Severe] Study  
- Also see Table 9 p. 820
- Cobicitat  
- See very slightly increases the exposure to delamanid. [Severe] Study
- Enzalutamide is predicted to slightly decrease the exposure to delamanid. Avoid. [Moderate] Study
- HIV- protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) very slightly increase the exposure to delamanid. [Severe] Study  
- Also see Table 9 p. 820
- Idealisib very slightly increases the exposure to delamanid. [Severe] Study
- Macrolides (clarithromycin) very slightly increase the exposure to delamanid. [Severe] Study  
- Also see Table 9 p. 820
- Rifampicin is predicted to slightly decrease the exposure to delamanid. Avoid. [Moderate] Study
- Desmopressin  
- See tetracyclines
- Denosumab  
- See monocalonal antibodies
- Desferrioxamine  
- See iron chelators
- Desflurane  
- See volatile halogenated anaesthetics
- Desloratadine  
- See antihistamines, non-sedating
- Desmopressin  
- See Table 18 p. 822 (hyponatraemia)
- Antiiepileptics (lamotrigine) are predicted to increase the risk of hyponatraemia when given with desmopressin. [Severe] Theoretical
- Loperamide greatly increases the absorption of oral desmopressin (and possibly sublingual). [Moderate] Study
- Phenothiazines (chlorpromazine) are predicted to increase the risk of hyponatraemia when given with desmopressin. [Severe] Theoretical

**Dose Estrel**

- Antiiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of dosestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical
- Desogestrel is predicted to increase the exposure to antiiepileptics (lamotrigine). [Moderate] Study
- Aprepitant is predicted to decrease the efficacy of dosestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical
- Bosentan is predicted to decrease the efficacy of dosestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical
- Efavirenz is predicted to decrease the efficacy of dosestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical
- Fosaprepitant is predicted to decrease the efficacy of dosestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical
- Griseofulvin potentially decreases the efficacy of dosestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Anecdotal
- HIV- protease inhibitors (ritonavir) are predicted to decrease the efficacy of dosestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical
- Modafinil is predicted to decrease the efficacy of dosestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical
- Nevirapine is predicted to decrease the efficacy of dosestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical
- Rifabutin is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical
- Rifampicin is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical
- St John’s Wort is predicted to decrease the efficacy of desogestrel. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical
- Sugammadex is predicted to decrease the exposure to desogestrel. Refer to patient information leaflet for missed pill advice. [Severe] Theoretical
- Ulipristal is predicted to decrease the efficacy of desogestrel. Avoid. [Severe] Theoretical
- Dexamethasone  
- See corticosteroids
- Dexametamine  
- See amfetamines
- Dextibuprofen  
- See NSAIDs
- Dextokopren  
- See NSAIDs
- Dexamethomide  
- See Table 11 p. 820 (CNS depressant effects)
- Dextrazoxane  
- See iron chelators
- Diamorphine  
- See opioids
- Diazepam  
- See Table 11 p. 820 (CNS depressant effects)
- Diazepam potentially affects the concentration of antiiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Severe] Study
- Antifungals, azoles (fluconazole, voriconazole) moderately increase the exposure to diazepam. Monitor and adjust dose. [Moderate] Study
- HIV- protease inhibitors (ritonavir) are predicted to increase the exposure to diazepam. Avoid. [Moderate] Theoretical
- Rifampicin moderately decreases the exposure to diazepam. Avoid. [Moderate] Study
- SSSri (fluvoxamine) moderately increase the exposure to diazepam. [Moderate] Study
- Diazoxide  
- See Table 8 p. 819 (hypotension)
- Diazoxide decreases the concentration of antiiepileptics (fosphenytoin, phenytoin) and antiiepileptics (fosphenytoin, phenytoin) are predicted to decrease the effects of diazoxide. Monitor concentration and adjust dose. [Moderate] Anecdotal
- Diazoxide increases the risk of severe hypotension when given with hydralazine. [Severe] Study  
- Also see Table 8 p. 819
- Diclofenac  
- See NSAIDs
- Dicycloverine  
- See Table 10 p. 820 (antimuscarinics)

**Didasonisone**  
- See Table 1 p. 818 (hepatotoxicity), Table 12 p. 821 (peripheral neuropathy)

**ROUTE-SPECIFIC INFORMATION**

Antacids in tablet formulation might affect absorption of other drugs—give at least 2 hours apart.
- Allopurinol moderately increases the exposure to didasonisone. Avoid. [Severe] Study
- Didasonisone (buffered) decreases the exposure to antifungals, azoles (itraconazole, ketoconazole). Separate administration by 2 hours. [Severe] Study  
- Also see Table 1 p. 818
- Febuxostat  
- Is predicted to increase the exposure to didasonisone. [Severe] Theoretical
- Ganciclovir is predicted to increase the exposure to didasonisone. [Moderate] Study
- HIV- protease inhibitors (tipranavir) decrease the exposure to didasonisone. Separate administration by 2 hours. [Moderate] Study
- Didasonisone (buffered) decreases the exposure to HIV- protease inhibitors (atazanavir). Didasonisone should be taken 2 hours after atazanavir. [Severe] Study
- Didasonisone (buffered) is predicted to decrease the exposure to HIV- protease inhibitors (darunavir) boosted with ritonavir. Didasonisone should be taken 1 hour before or 2 hours after darunavir. [Moderate] Theoretical
- Didasonisone (buffered) decreases the exposure to HIV- protease inhibitors (indinavir). Separate administration by 1 hour. [Severe] Study
- Hydroxycarbamide increases the risk of toxicity when given with didasonisone. Avoid. [Severe] Study
- Isoniazid is predicted to increase the risk of peripheral neuropathy when given with didasonisone. [Severe] Theoretical  
- Also see Table 1 p. 818  
- Also see Table 12 p. 821
Didanosine increases the concentration of ribavirin. [Severe] Study
Didanosine (buffered) is predicted to greatly decrease the exposure to oral quinolones. Didanosine should be taken 2 hours after quinolones. [Moderate] Study
Ribavirin is predicted to increase the exposure to didanosine. [Severe] Study
Didanosine increases the risk of toxicity when given with stavudine. Avoid. [Severe] Study → Also see TABLE 12 p. 821
Tenoflovir increases the risk of toxicity when given with didanosine. Avoid. [Severe] Study
Valganciclovir is predicted to increase the exposure to didanosine. [Moderate] Study

**Digoxin** → see TABLE 6 p. 819 (bradycardia)

### GENERAL INFORMATION

Drugs that reduce serum potassium are predicted to increase the risk of digoxin toxicity, see TABLE 17 p. 822.

- Acarbose decreases the concentration of digoxin. [Moderate] Study
- Aldosterone antagonists (spironolactone) increase the concentration of digoxin. Monitor and adjust dose. [Moderate] Study
- Aminoglycosides potentially increase the concentration of digoxin. Monitor and adjust dose. [Mild] Study
- Antacids decrease the absorption of digoxin. Separate administration by 2 hours. [Mild] Study
- Antiarrhythmics (amiodarone, dronedarone) are predicted to moderately increase the exposure to digoxin. Monitor and adjust digoxin dose, p. 79. [Severe] Study → Also see TABLE 6 p. 819
- Antiarrhythmics (propafenone) increase the concentration of digoxin. Monitor and adjust dose. [Severe] Study
- Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the concentration of digoxin. [Moderate] Anecdotal
- Antifungals, azoles (itraconazole) markedly increase the concentration of digoxin. Monitor and adjust dose. [Severe] Study
- Antifungals, azoles (posaconazole) are predicted to increase the concentration of digoxin. [Severe] Theoretical
- Antimalarials (mefloquine) are predicted to increase the risk of bradycardia when given with digoxin. [Severe] Theoretical
- Antimalarials (quinine) increase the concentration of digoxin. Monitor and adjust digoxin dose, p. 79. [Severe] Anecdotal
- Balsalazide is predicted to decrease the concentration of digoxin. [Moderate] Theoretical
- Calcium channel blockers (diltiazem, verapamil) increase the concentration of digoxin. Monitor and adjust dose. [Severe] Study → Also see TABLE 6 p. 819
- Intravenous calcium salts increase the concentration of digoxin. Avoid. [Moderate] Anecdotal
- Carbimazole affects the concentration of digoxin. Monitor and adjust dose. [Moderate] Theoretical
- Ceritinib is predicted to increase the risk of bradycardia when given with digoxin. Avoid. [Severe] Theoretical
- Ciclosporin increases the concentration of digoxin. Monitor and adjust dose. [Severe] Theoretical
- Daclatasvir slightly increases the concentration of digoxin. [Severe] Study
- HIV- protease inhibitors (ritonavir) increase the concentration of digoxin. Adjust dose and monitor concentration. [Severe] Study
- Lapatinib is predicted to increase the exposure to digoxin. [Moderate] Theoretical
- Levothyroxine is predicted to affect the concentration of digoxin. Monitor and adjust dose. [Moderate] Theoretical
- Liothyronine is predicted to affect the concentration of digoxin. Monitor and adjust dose. [Moderate] Theoretical
- Lumacaftor is predicted to affect the exposure to digoxin. Monitor and adjust dose. [Moderate] Theoretical
- Macrolides increase the concentration of digoxin. [Severe] Anecdotal
- Mirabegron slightly increases the exposure to digoxin. Monitor digoxin concentration and adjust dose, p. 79. [Severe] Study
- Neomycin decreases the absorption of digoxin. [Moderate] Study
- Neuroumuscular blocking drugs, non-depolarising (pancuronium) are predicted to increase the risk of cardiovascular side-effects when given with digoxin. [Severe] Anecdotal
- NSAIDs (indomethacin) increase the concentration of digoxin. [Severe] Study
- Penicillamine potentially decreases the concentration of digoxin. Separate administration by 2 hours. [Severe] Anecdotal
- Pitolisant is predicted to decrease the exposure to digoxin. Unknown Theoretical
- Ranolazine increases the concentration of digoxin. [Moderate] Study
- Rifampicin decreases the concentration of digoxin. [Moderate] Study
- St John’s Wort decreases the concentration of digoxin. Avoid. [Severe] Anecdotal
- Sucralfate decreases the absorption of digoxin. Separate administration by 2 hours. [Severe] Anecdotal
- Sulphasalazine decreases the concentration of digoxin. [Moderate] Study
- Suxamethonium is predicted to increase the risk of cardiovascular side-effects when given with digoxin. [Severe] Anecdotal
- Ticagrelor increases the concentration of digoxin. [Moderate] Study
- Tolvaptan increases the concentration of digoxin. [Mild] Study
- Trimethoprim increases the concentration of digoxin. [Moderate] Study
- Vandetanib slightly increases the exposure to digoxin. Monitor ECG and adjust dose. [Moderate] Study
- Velpatasvir is predicted to increase the exposure to digoxin. [Severe] Study
- Vitamin D substances are predicted to increase the risk of toxicity when given with digoxin. [Severe] Theoretical
- Dihydrocodeine → see opioids
- Dihydrodichloroethane → see vitamin D substances
- Diltiazem → see calcium channel blockers
- Dimenhydrinate → see TABLE 10 p. 820 (antimuscarinics)
- Dimethyl fumarate
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with dimethyl fumarate. Public Health England advises avoid. [Severe] Theoretical
- Dimethyl sulfoxide
- Topical dimethyl sulfoxide potentially increases the risk of peripheral neuropathy when given with NSAIDs (sulindac). Avoid. [Severe] Anecdotal
- Diphenoxylate → see opioids
- Dipipanone → see opioids
- Dipryidamole → see TABLE 8 p. 819 (hypotension), TABLE 4 p. 818 (antiplaque effects)
- Antacids are predicted to decrease the absorption of dipyriramole (immediate release tablets). [Moderate] Theoretical
- Dipyriramole increases the exposure to antiarrhythmics (adenosine). Avoid or adjust dose. [Severe] Study
- H2 receptor antagonists are predicted to decrease the absorption of dipyriramole (immediate release tablets). [Moderate] Theoretical
- Proton pump inhibitors are predicted to decrease the absorption of dipyriramole (immediate release tablets). [Moderate] Theoretical
- Disopyramide → see antiarrhythmics
- Disulfiram → see TABLE 12 p. 821 (peripheral neuropathy)

**FOOD AND LIFESTYLE** Disulfiram gives rise to an extremely unpleasant systemic reaction after the ingestion of even a small amount of alcohol. Ensure that alcohol is not consumed for at least 24 hours before initiating treatment and should be avoided for at least 1 week after stopping treatment.

- Disulfiram increases the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Severe] Study → Also see TABLE 12 p. 821
- Disulfiram increases the anticoagulant effect of coumarins. Monitor and adjust dose. [Severe] Study
- Disulfiram increases the risk of acute psychoses when given with metronidazole. [Severe] Study → Also see TABLE 12 p. 821
Disulfiram

- **Disulfiram** is predicted to increase the anticoagulant effect of phenindione. [Severe] Theoretical

**Dobutamine** can predictably decrease the effects of bosentan. [Severe] Study

- **Doxycycline** can predictably decrease the exposure to doxycycline. [Severe] Study

- **Dolutegravir**
  - Antacids moderately decrease the exposure to dolutegravir. Dolutegravir should be taken 2 hours before or 6 hours after antacids. [Moderate] Study
  - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to dolutegravir. Adjust dose. [Severe] Study
  - Antiepileptics (oxcarbazepine) are predicted to decrease the exposure to dolutegravir. Adjust dose. [Severe] Theoretical
  - Bosentan decreases the exposure to dolutegravir. Adjust dose. [Severe] Study
  - Oral calcium salts decrease the absorption of dolutegravir. Dolutegravir should be taken 2 hours before or 6 hours after calcium salts. [Moderate] Study
  - Efavirenz decreases the exposure to dolutegravir. Adjust dose. [Severe] Study
  - Enzalutamide decreases the exposure to dolutegravir. Adjust dose. [Severe] Study
  - Etravirine moderately decreases the exposure to dolutegravir. Avoid unless given with atazanavir, darunavir, or lopinavir (all boosted with ritonavir). [Severe] Study
  - HIV-protease inhibitors (fosamprenavir) boosted with ritonavir slightly decrease the exposure to dolutegravir. Avoid if resistant to HIV-integrase inhibitors. [Severe] Study
  - HIV-protease inhibitors (tipranavir) moderately decrease the exposure to dolutegravir. Refer to specialist literature. [Severe] Study
  - Iron (oral) decreases the absorption of dolutegravir. Iron (oral) should be taken 2 hours before or 6 hours after dolutegravir. [Moderate] Study
  - Dolutegravir slightly to moderately increases the exposure to metformin. Use with caution and adjust dose. [Severe] Study
  - Nevirapine decreases the exposure to dolutegravir. Adjust dose. [Severe] Study
  - Rifampicin decreases the exposure to dolutegravir. Adjust dose. [Severe] Study
  - St John’s Wort decreases the exposure to dolutegravir. Adjust dose. [Severe] Study
  - Sucralfate decreases the absorption of dolutegravir. [Moderate] Study

**Domperidone**

- Dolutegravir should be taken 2 hours before or 6 hours after domperidone. [Moderate] Study
- Calcium channel blockers (diltiazem, verapamil) increase the risk of QT-prolongation when given with domperidone. Avoid. [Severe] Study
- Aprepitant increases the risk of QT-prolongation when given with domperidone. Avoid. [Severe] Study
- Crizotinib increases the risk of QT-prolongation when given with domperidone. Avoid. [Severe] Study
- Domperidone is predicted to decrease the prolactin-lowering effect of dopamine receptor agonists (bromocriptine, cabergoline). [Moderate] Theoretical
- Nitapritin increases the risk of QT-prolongation when given with domperidone. Avoid. [Severe] Study
- Nilotinib increases the risk of QT-prolongation when given with domperidone. Avoid. [Severe] Study
- Donepezil is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical
- Aripiprazole decreases the absorption of efavirenz. Avoid. [Severe] Study
- Efavirenz decreases the absorption of efavirenz. Avoid. [Severe] Study
- Enzalutamide decreases the exposure to efavirenz. Adjust dose. [Moderate] Study
- Etravirine moderately decreases the exposure to efavirenz. Avoid unless given with atazanavir, darunavir, or lopinavir (all boosted with ritonavir). [Severe] Study
- HIV-protease inhibitors (fosamprenavir) boosted with ritonavir slightly decrease the exposure to efavirenz. Avoid if resistant to HIV-integrase inhibitors. [Severe] Study
- HIV-protease inhibitors (tipranavir) moderately decrease the exposure to efavirenz. Refer to specialist literature. [Severe] Study
- Iron (oral) decreases the absorption of efavirenz. Iron (oral) should be taken 2 hours before or 6 hours after efavirenz. [Moderate] Study
- Dolutegravir slightly to moderately increases the exposure to efavirenz. Use with caution and adjust dose. [Severe] Study
- Nevirapine decreases the exposure to efavirenz. Adjust dose. [Severe] Study
- Rifampicin decreases the exposure to efavirenz. Adjust dose. [Severe] Study
- St John’s Wort decreases the exposure to efavirenz. Adjust dose. [Severe] Study
- Sucralfate decreases the absorption of efavirenz. [Moderate] Study

**Efavirenz**

- Dolutegravir should be taken 2 hours before or 6 hours after efavirenz. [Moderate] Study
- Calcium channel blockers (diltiazem, verapamil) increase the risk of QT-prolongation when given with efavirenz. Avoid. [Severe] Study
- Combined hormonal contraceptives are predicted to increase the exposure to roxithromycin. [Severe] Study
- Crizotinib is predicted to increase the exposure to dopamine receptor agonists (bromocriptine, cabergoline). [Severe] Theoretical
- Domperidone is predicted to decrease the prolactin-lowering effect of dopamine receptor agonists (bromocriptine, cabergoline). [Moderate] Theoretical
- Dopamine receptor agonists (cabergoline) are predicted to increase the risk of ergotism when given with dopamine receptor agonists (bromocriptine, cabergoline). Avoid. [Moderate] Theoretical
- Etravirine increases the exposure to dopamine receptor agonists (bromocriptine, cabergoline). Avoid. [Moderate] Theoretical
- HIV-protease inhibitors (ritonavir) increase the risk of QT-prolongation when given with efavirenz. Avoid. [Moderate] Theoretical
- Nitapritin increases the risk of QT-prolongation when given with efavirenz. Avoid. [Severe] Study
- Omeprazole increases the exposure to efavirenz. [Severe] Study
- Ondansetron increases the exposure to efavirenz. [Severe] Study
- Dolutegravir decreases the absorption of efavirenz. Avoid. [Severe] Study
- Aprepitant increases the risk of QT-prolongation when given with efavirenz. Avoid. [Severe] Study
- Crizotinib is predicted to increase the exposure to dopamine receptor agonists (bromocriptine, cabergoline). [Severe] Theoretical
Ergotamine is predicted to increase the risk of ergotism when given with pergolide. [Moderate] Theoretical
Flupentixol is predicted to decrease side effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 819
Apomorphine is predicted to increase the risk of severe hypotension when given with granisetron. [Severe] Theoretical
H₂ receptor antagonists (cimetidine) slightly increase the exposure to pramipexole. Adjust dose. [Moderate] Study
Haloperidol is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 819 → Also see TABLE 9 p. 820 → Also see TABLE 10 p. 820
HIV-protase inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) increase the exposure to dopamine receptor agonists (bromocriptine, cabergoline). [Severe] Study
HIV-protase inhibitors (indinavir) are predicted to increase the exposure to dopamine receptor agonists (bromocriptine, cabergoline). [Severe] Theoretical
Hormone replacement therapy decreases the clearance of ropinirole. Monitor and adjust dose. [Moderate] Study
Idelalisib increases the exposure to dopamine receptor agonists (bromocriptine, cabergoline). [Severe] Study
Imatinib is predicted to increase the exposure to dopamine receptor agonists (bromocriptine, cabergoline). [Severe] Theoretical
Loxapine is predicted to decrease the effects of dopamine receptor agonists. [Moderate] Theoretical → Also see TABLE 8 p. 819 → Also see TABLE 9 p. 820
Macrolides (clarithromycin) increase the exposure to dopamine receptor agonists (bromocriptine, cabergoline). [Severe] Study
Macrolides (erythromycin) are predicted to increase the exposure to dopamine receptor agonists (bromocriptine, cabergoline). [Severe] Theoretical
Amanitadine increases the risk of CNS toxicity when given with memantine. Use with caution or avoid. [Severe] Theoretical
Memantine is predicted to increase the effects of dopamine receptor agonists (apomorphine, bromocriptine, cabergoline, pergolide, pramipexole, quinagolide, ropinirole, rotigotine). [Moderate] Theoretical
Metoclopramide is predicted to decrease the effects of dopamine receptor agonists, (apomorphine, bromocriptine, cabergoline, pergolide, pramipexole, quinagolide, ropinirole, rotigotine). [Moderate] Theoretical
Netupitant is predicted to increase the exposure to dopamine receptor agonists (bromocriptine, cabergoline). [Severe] Theoretical
Nilotinib is predicted to increase the exposure to dopamine receptor agonists (bromocriptine, cabergoline). [Severe] Theoretical
Olanzapine is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 819
Apomorphine increases the risk of severe hypotension when given with ondansetron. [Severe] Study → Also see TABLE 9 p. 820
Paliperidone is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 819 → Also see TABLE 9 p. 820
Apomorphine is predicted to increase the risk of severe hypotension when given with palonosetron. [Severe] Theoretical
Phenothiazines are predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Study → Also see TABLE 8 p. 819 → Also see TABLE 9 p. 820 → Also see TABLE 10 p. 820
Pimozide is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 819 → Also see TABLE 9 p. 820 → Also see TABLE 10 p. 820
Quetiapine is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 819
Quinolones (ciprofloxacin) are predicted to increase the exposure to ropinirole. Adjust dose. [Moderate] Study
Risperidone is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 819 → Also see TABLE 9 p. 820
SSRIs (fluvoxamine) are predicted to increase the exposure to ropinirole. Adjust dose. [Moderate] Study
Sulpiride is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 819 → Also see TABLE 9 p. 820
Zuclopenthixol is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 819 → Also see TABLE 9 p. 820
Dopexamine → see sympathomimetics, isotropic
Dorzolamide

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

Doseupin → see tricyclic antidepressants
Doxapram
Aminophylline increases the risk of agitation when given with doxapram. [Moderate] Study
Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the effects of doxapram. [Moderate] Theoretical
Theophylline increases the risk of agitation when given with doxapram. [Moderate] Study
Doxazosin → see alpha blockers
Doxepin → see tricyclic antidepressants
Doxorbicin → see anthracyclines
Doxycline → see tetracyclines
Dronedarone → see antiarrhythmics
Droperidol → see TABLE 8 p. 819 (hypotension), TABLE 9 p. 820 (QT-interval prolongation), TABLE 11 p. 820 (CNS depressant effects)
Droperidol is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 819 → Also see TABLE 9 p. 820
Droperidol is predicted to decrease the effects of guanethidine. Monitor and adjust dose. [Moderate] Theoretical → Also see TABLE 8 p. 819
Droperidol decreases the effects of levodopa. [Severe] Study → Also see TABLE 8 p. 819
Drospirenone → see TABLE 16 p. 822 (increased serum potassium)
Antifungals, azoles (ketokonazole) moderately increase the exposure to drospirenone. [Severe] Study
Dulaglutide → see TABLE 14 p. 821 (antidiabetic drugs)
Duloxetine → see TABLE 18 p. 822 (hyponatraemia), TABLE 13 p. 821 (serotonin syndrome), TABLE 4 p. 818 (antiplatelet effects)
Duloxetine is predicted to increase the exposure to antiarrhythmics (flecainide). [Severe] Theoretical
Duloxetine is predicted to increase the exposure to beta blockers, non-selective (carvedilol, timolol). [Moderate] Theoretical
Duloxetine is predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). [Moderate] Study
Duloxetine is predicted to decrease the efficacy of opioids (tramadol). [Moderate] Study → Also see TABLE 13 p. 821
Duloxetine is predicted to increase the exposure to pitolisant. Use with caution and adjust dose. [Moderate] Study
Quinolones (ciprofloxacin) are predicted to increase the exposure to duloxetine. Avoid. [Moderate] Theoretical
SSRIs (fluvoxamine) markedly increase the exposure to duloxetine. Avoid. [Severe] Study → Also see TABLE 18 p. 822 → Also see TABLE 13 p. 821 → Also see TABLE 4 p. 818
Dutasteride
Antiarhythmics (dronedarone) are predicted to moderately increase the exposure to dutasteride. [Mild] Study
Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to moderately increase the exposure to dutasteride. [Mild] Study
Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to dutasteride. [Mild] Study
Dutasteride is predicted to moderately increase the exposure to dutasteride. [Mild] Study
Calcium channel blockers (diltiazem, verapamil) are predicted to moderately increase the exposure to dutasteride. [Mild] Study
Cobicistat is predicted to increase the exposure to dutasteride. Monitor side effects and adjust dose. [Moderate] Theoretical
Crizotinib is predicted to moderately increase the exposure to dutasteride. [Mild] Study
HIV-protase inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to...
Dutasteride (continued)

Increase the exposure to dutasteride. Monitor side effects and adjust dose. [Moderate] Theoretical
- HIV-protease inhibitors (indinavir) are predicted to moderately increase the exposure to dutasteride. [Mild] Study
- Itraconazole is predicted to increase the exposure to dutasteride. Monitor side effects and adjust dose. [Moderate] Theoretical
- Lopinavir/ritonavir, and saquinavir are predicted to slightly increase the exposure to dutasteride. [Mild] Study
- Macrolides (clarithromycin) are predicted to increase the exposure to dutasteride. Monitor side effects and adjust dose. [Moderate] Theoretical
- Macrolides (erythromycin) are predicted to moderately increase the exposure to dutasteride. [Mild] Study
- Mirabegron is predicted to moderately increase the exposure to dutasteride. [Mild] Study
- Netupitant is predicted to moderately increase the exposure to dutasteride. [Mild] Study
- Pimozide is predicted to decrease the exposure to dutasteride. [Mild] Study

Macrolides (azithromycin, clarithromycin) are predicted to slightly increase the exposure to edoxaban. Adjust edoxaban dose. [Severe] Study
- Antifungals, azoles (itraconazole) are predicted to slightly increase the exposure to edoxaban. [Severe] Study
- Antifungals, azoles (ketoconazole) are predicted to slightly increase the exposure to edoxaban. Adjust edoxaban dose. [Severe] Study
- Calcium channel blockers (verapamil) are predicted to slightly increase the exposure to edoxaban. [Severe] Study
- Ceritinib is predicted to increase the exposure to edoxaban. [Moderate] Theoretical
- Ciclosporin slightly increases the exposure to edoxaban. Adjust edoxaban dose. [Severe] Study
- HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to slightly increase the exposure to edoxaban. [Severe] Theoretical
- Lapatinib is predicted to slightly increase the exposure to edoxaban. [Severe] Theoretical
- Lumacaftor is predicted to affect the exposure to edoxaban. [Moderate] Theoretical
- Macrolides (azithromycin, clarithromycin) are predicted to slightly increase the exposure to edoxaban. [Severe] Theoretical
- Macrolides (erythromycin) slightly increase the exposure to edoxaban. Adjust edoxaban dose. [Severe] Study
- Mirabegron is predicted to increase the exposure to edoxaban. [Mild] Theoretical
- Ranolazine is predicted to slightly increase the exposure to edoxaban. [Severe] Theoretical
- Rifampicin is predicted to decrease the exposure to edoxaban. [Moderate] Study
- St John’s Wort is predicted to decrease the exposure to edoxaban. [Moderate] Study
- Velpatasvir is predicted to increase the exposure to edoxaban. [Severe] Theoretical
- Vemurafenib is predicted to slightly increase the exposure to edoxaban. [Severe] Theoretical

Efavirenz
- Efavirenz is predicted to decrease the exposure to antirarrhythmics (dronedarone). [Severe] Theoretical
- Antiepileptics (carbamazepine) slightly decrease the exposure to efavirenz and efavirenz slightly decreases the exposure to antiepileptics (carbamazepine). [Severe] Study
- Antiepileptics (fosphenytoin, phenytoin) slightly decrease the exposure to efavirenz and efavirenz affects the concentration of antiepileptics (phenobarbital). [Severe] Theoretical
- Antiepileptics (phenobarbital) are predicted to decrease the exposure to efavirenz and efavirenz affects the concentration of antiepileptics (phenobarbital). [Severe] Theoretical
- Efavirenz is predicted to affect the efficacy of antiepileptics (primidone) and antiepileptics (primidone) are predicted to slightly decrease the exposure to efavirenz. [Severe] Theoretical
- Efavirenz is predicted to decrease the exposure to antifungals, azoles (isavuconazole). Avoid. [Severe] Theoretical
- Efavirenz slightly decreases the exposure to antifungals, azoles (itraconazole). Avoid efavirenz for 14 days before and during treatment with itraconazole. [Moderate] Study
- Efavirenz moderately decreases the exposure to antifungals, azoles (ketoconazole). Avoid. [Severe] Study
- Efavirenz slightly decreases the exposure to antifungals, azoles (posaconazole). Avoid. [Moderate] Study
- Efavirenz moderately decreases the exposure to antifungals, azoles (voriconazole) and antifungals, azoles (itraconazole) slightly increase the exposure to efavirenz. Adjust dose. [Severe] Study
- Efavirenz decreases the concentration of antimalarials (artemether). Avoid. [Severe] Study
- Efavirenz moderately decreases the exposure to antimalarials (atovaquone). Avoid. [Moderate] Study
- Efavirenz affects the exposure to antimalarials (proguanil). Avoid. [Moderate] Study
- Efavirenz is predicted to decrease the exposure to axitinib. Avoid. [Severe] Theoretical
- Efavirenz is predicted to decrease the exposure to bedaquiline. Avoid. [Severe] Study
- Efavirenz is predicted to decrease the exposure to bosutinib. Avoid. [Severe] Theoretical
- Efavirenz moderately decreases the exposure to bupropion. [Moderate] Study
- Efavirenz is predicted to decrease the exposure to cabozantinib. [Moderate] Theoretical
- Efavirenz is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Theoretical
- Efavirenz is predicted to decrease the exposure to calcium channel blockers (diltiazem, verapamil). [Moderate] Theoretical
- Efavirenz is predicted to decrease the concentration of caspofungin. Adjust dose. [Moderate] Study
- Efavirenz decreases the concentration of ciclosporin. Monitor ciclosporin concentration and adjust dose. [Moderate] Study
- Efavirenz is predicted to decrease the exposure to cobicistat. Avoid. [Severe] Theoretical
- Efavirenz is predicted to decrease the exposure to cobimetinib. Avoid. [Severe] Theoretical
- Efavirenz is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Study
- Efavirenz is predicted to affect the concentration of coumarins. Adjust dose. [Moderate] Theoretical
- Efavirenz is predicted to decrease the exposure to daclatasvir. Adjust dose. [Severe] Study
- Efavirenz is predicted to decrease the exposure to dasatinib. [Severe] Study
- Efavirenz is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical
- Efavirenz decreases the exposure to dolutegravir. Adjust dose. [Severe] Study
- Efavirenz is predicted to moderately decrease the exposure to elbasvir. Avoid. [Severe] Study
- Efavirenz is predicted to decrease the concentration of elvitegravir. Avoid. [Severe] Theoretical
- Efavirenz is predicted to decrease the effects of ergotamine. [Moderate] Theoretical
- Efavirenz is predicted to decrease the exposure to erlotinib. [Severe] Theoretical
- Efavirenz is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical
- Efavirenz is predicted to decrease the exposure to etravirine. Avoid. [Severe] Study
- Efavirenz is predicted to decrease the concentration of everolimus. Avoid or adjust dose. [Severe] Study
### Efavirenz
- Predicted to decrease the exposure to gefitinib. Avoid. (Severe) Theoretical
- Predicted to markedly decrease the exposure to grazoprevir. Avoid. (Severe) Study
- Predicted to decrease the concentration of guanfacine. Adjust dose. (Moderate) Theoretical
- Reduces the exposure to HIV-protease inhibitors. Refer to specialist literature. (Severe) Study
- Predicted to decrease the effects of hormone replacement therapy. (Moderate) Anecdotal
- Predicted to decrease the exposure to imatinib. (Moderate) Study
- Predicted to decrease the exposure to lopinavir. Avoid. (Severe) Study
- Predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 474. (Severe) Theoretical
- Predicted to decrease the exposure to lurasidone. Monitor and adjust dose. (Moderate) Theoretical
- Reduces the exposure to macrolides (clarithromycin). (Moderate) Study
- Reduces the exposure to maraviroc. Refer to specialist literature. (Severe) Theoretical
- Predicted to alter the effects of midazolam. Avoid. (Moderate) Theoretical
- Nevirapine decreases the concentration of efavirenz. Avoid. (Severe) Study
- Predicted to decrease the exposure to nilotinib. Avoid. (Severe) Theoretical
- Predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 474. (Severe) Anecdotal
- Predicted to decrease the exposure to olaparib. Avoid. (Moderate) Theoretical
- Decreases the exposure to opioids (methadone). Monitor and adjust dose. (Severe) Study
- Predicted to decrease the exposure to osimertinib. (Moderate) Theoretical
- Predicted to decrease the exposure to paritaprevir with ritonavir and ombitasvir. Avoid. (Severe) Study
- Predicted to decrease the exposure to phosphodiesterase type-5 inhibitors. (Moderate) Theoretical
- Pitolisant is predicted to decrease the exposure to efavirenz. (Unknown) Theoretical
- Slightly decreases the exposure to rifabutin. Adjust dose. (Severe) Study
- Rifampicin slightly decreases the exposure to efavirenz. Adjust dose. (Severe) Study
- Predicted to decrease the exposure to rilpivirine. Avoid. (Severe) Theoretical
- Predicted to decrease the exposure to ruxolitinib. Monitor and adjust dose. (Moderate) Theoretical
- Predicted to decrease the exposure to simeprevir. Avoid. (Severe) Study
- Predicted to decrease the concentration of sirolimus. Monitor and adjust dose. (Moderate) Theoretical
- Predicted to decrease the concentration of efavirenz. Avoid. (Severe) Theoretical
- Slightly decreases the exposure to statins (atorvastatin). (Minor) Study
- Efavirenz moderately decreases the exposure to statins (simvastatin). (Moderate) Study
- Predicted to decrease the concentration of tacrolimus. Monitor and adjust dose. (Moderate) Theoretical
- Predicted to decrease the exposure to taxanes (cabazitaxel). Avoid. (Severe) Study
- Predicted to decrease the concentration of temsirolimus. Avoid. (Severe) Theoretical
- Predicted to decrease the exposure to ticagrelor. (Moderate) Theoretical
- Predicted to decrease the exposure to tolvaptan. (Moderate) Theoretical
- Efavirenz decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 474. (Severe) Anecdotal
- Predicted to decrease the exposure to velpatasvir. Avoid. (Moderate) Theoretical
- Efavirenz decreases the efficacy of efavirenz. Avoid. (Severe) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to efavirenz. Avoid. (Severe) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) slightly to moderately increase the exposure to efavirenz. Avoid. (Moderate) Study
- Bosentan is predicted to moderately decrease the exposure to efavirenz. Avoid. (Severe) Study
- Cobicistat is predicted to slightly to moderately increase the exposure to efavirenz. Avoid. (Moderate) Study
- Elbasvir is predicted to increase the concentration of dabigatran. (Moderate) Theoretical
- Efavirenz is predicted to moderately decrease the exposure to efavirenz. Avoid. (Severe) Study
- Enzalutamide is predicted to decrease the exposure to efavirenz. Avoid. (Severe) Study
- Etravirine is predicted to decrease the exposure to efavirenz. Avoid. (Unknown) Theoretical
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) slightly to moderately increase the exposure to efavirenz. Avoid. (Moderate) Study
- Idelalisib is predicted to slightly to moderately increase the exposure to efavirenz. Avoid. (Moderate) Study
- Macrolides (clarithromycin) slightly to moderately increase the exposure to efavirenz. Avoid. (Moderate) Study
- Modafinil is predicted to decrease the exposure to efavirenz. Avoid. (Severe) Study
- Modafinil is predicted to decrease the exposure to elbasvir. Avoid. (Severe) Study
- Nevirapine is predicted to moderately decrease the exposure to efavirenz. Avoid. (Severe) Study
- Nevirapine is predicted to moderately decrease the exposure to elbasvir. Avoid. (Severe) Study
- Rifampicin is predicted to decrease the exposure to efavirenz. Avoid. (Severe) Study
- St John’s Wort is predicted to moderately decrease the exposure to efavirenz. Avoid. (Severe) Study
- Elbasvir potentially increases the exposure to statins (atorvastatin). Adjust atorvastatin dose, p. 128. (Moderate) Study
- Elbasvir is predicted to increase the exposure to statins (fluvastatin). Adjust fluvastatin dose, p. 129. (Unknown) Theoretical
- Elbasvir increases the exposure to statins (rosuvastatin). Adjust rosvastatin dose, p. 130. (Moderate) Study
- Elbasvir is predicted to increase the exposure to statins (simvastatin). Adjust simvastatin dose, p. 130. (Unknown) Theoretical
- Eletriptan → see TABLE 13 p. 821 (serotonin syndrome)
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to eletriptan. Avoid. (Severe) Study
- Cobicistat is predicted to markedly increase the exposure to eletriptan. Avoid. (Severe) Study
- Eletriptan increases the risk of vasoconstriction when given with ergotamine. Separate administration by 24 hours. (Severe) Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to markedly increase the exposure to eletriptan. Avoid. (Severe) Study
- Idelalisib is predicted to markedly increase the exposure to eletriptan. Avoid. (Severe) Study
- Macrolides (clarithromycin) are predicted to markedly increase the exposure to eletriptan. Avoid. (Severe) Study
- Macrolides (erythromycin) moderately increase the exposure to eletriptan. Avoid. (Moderate) Study
- Elotuzumab → see monoclonal antibodies

### Eltrombopag
- Antacids decrease the absorption of eltrombopag. Eltrombopag should be taken 2 hours before or 4 hours after antacids. (Severe) Study
- Oral calcium salts decrease the absorption of eltrombopag. Eltrombopag should be taken 2 hours before or 4 hours after calcium salts. (Severe) Study
Elvitegravir

- Antacids moderately decrease the exposure to elvitegravir. Separate administration by at least 4 hours. (Moderate) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of elvitegravir. Avoid. (Severe) Theoretical
- Bosentan is predicted to decrease the concentration of elvitegravir. Avoid. (Severe) Theoretical
- Elvitegravir is predicted to decrease the anticoagulant effect of coumarins. (Moderate) Theoretical
- Efavirenz is predicted to decrease the concentration of elvitegravir. Avoid. (Severe) Theoretical
- Enalapril is predicted to decrease the concentration of elvitegravir. Avoid. (Severe) Theoretical
- HIV- protease inhibitors (atazanavir, lopinavir) increase the concentration of elvitegravir. Refer to specialist literature. (Moderate) Study
- Nevirapine is predicted to decrease the concentration of elvitegravir. Avoid. (Severe) Theoretical
- Rifampicin is predicted to decrease the concentration of elvitegravir. Avoid. (Severe) Theoretical
- St John’s Wort is predicted to decrease the concentration of elvitegravir. Avoid. (Severe) Theoretical

Empagliflozin → see Table 14 p. 821 (antidiabetic drugs), Table 8 p. 819 (hypotension)

Enalapril → see ACE inhibitors
Enoxaparin → see low molecular-weight heparins

Entacapone
- Iron (oral) is predicted to decrease the absorption of entacapone. Separate administration by at least 2 hours. (Moderate) Theoretical
- Entacapone increases the exposure to levodopa. Monitor side effects and adjust dose. (Moderate) Study
- Entacapone is predicted to increase the exposure to methylidopa. (Moderate) Theoretical
- Entacapone is predicted to increase the risk of elevated blood pressure when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid. (Severe) Theoretical
- Entacapone is predicted to increase the risk of cardiovascular side-effects when given with sympathomimetics, isotropic (dobutamine, dopamine). (Moderate) Theoretical
- Entacapone is predicted to increase the risk of cardiovascular side-effects when given with sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine). (Moderate) Study

Enteral feeds
- Antacids (aluminium hydroxide) increase the risk of blocked enteral or nasogastric tubes when given with enteral feeds. (Moderate) Study
- Enteral feeds decrease the absorption of antiepileptics (phenytoin). (Severe) Study
- Enteral feeds (vitamin-K containing) potentially decrease the anticoagulant effect of coumarins. (Severe) Anecdotal
- Enteral feeds (vitamin-K containing) potentially decrease the effects of phenindione. (Severe) Theoretical
- Enteral feeds decrease the exposure to quinolones (ciprofloxacin). (Moderate) Study
- Sucralfate increases the risk of blocked enteral or nasogastric tubes when given with enteral feeds. Separate administration by 1 hour. (Moderate) Study
- Enteral feeds decrease the exposure to theophylline. (Moderate) Study

Eltrombopag

GENERAL INFORMATION

Caution with concurrent chemotherapy—safety and efficacy not established.

- Eltrombopag is predicted to decrease the exposure to abacavir. (Moderate) Theoretical
- Eltrombopag is predicted to decrease the exposure to abiraterone. Avoid. (Severe) Theoretical
- Eltrombopag is predicted to decrease the exposure to aldosterone antagonists (epilorenone).
- Eltrombopag is predicted to decrease the exposure to alprazolam. Adjust alprazolam dose. (Moderate) Theoretical
- Eltrombopag is predicted to decrease the exposure to antiarrhythmics (disopyramide, dronedarone). Avoid. (Severe) Study
- Eltrombopag is predicted to decrease the efficacy of antiarrhythmics (propafenone). (Moderate) Study
- Eltrombopag is predicted to decrease the exposure to antiepileptics (brivaracetam). (Moderate) Theoretical
- Eltrombopag is predicted to decrease the exposure to antiepileptics (perampanel). Monitor and adjust dose. Moderate. Study
- Eltrombopag is predicted to decrease the exposure to antifungals, azoles (isavuconazole). Avoid. (Severe) Study
- Eltrombopag is predicted to decrease the exposure to antimalarias (artemether) with lumefantrine. Avoid. (Severe) Study
- Eltrombopag is predicted to decrease the concentration of antimalarias (piperazine). Avoid. (Moderate) Theoretical
- Eltrombopag is predicted to moderately decrease the exposure to apixaban. Use with caution or avoid. (Severe) Study
- Eltrombopag moderately decreases the exposure to apremilast. Avoid. (Severe) Study
- Eltrombopag is predicted to markedly decrease the exposure to aprepitant. Avoid. (Moderate) Study
- Eltrombopag is predicted to moderately decrease the exposure to aprepitant. Avoid. (Severe) Study
- Eltrombopag is predicted to markedly decrease the exposure to aripiprazole. Adjust aripiprazole dose, p. 240. Moderate. Study
- Eltrombopag is predicted to decrease the exposure to axitinib. Avoid or adjust dose. Moderate. Study
- Eltrombopag decreases the exposure to bedaquiline. Avoid. (Severe) Study
- Eltrombopag slightly decreases the exposure to bortezomib. Avoid. (Severe) Study
- Eltrombopag affects the exposure to bosentan. Avoid. (Severe) Study
- Eltrombopag is predicted to very markedly decrease the exposure to bosutinib. Avoid. (Severe) Study
- Eltrombopag is predicted to markedly decrease the exposure to buspirone. Use with caution and adjust dose. (Severe) Study
- Eltrombopag moderately decreases the exposure to cabozantinib. Avoid. (Moderate) Study
- Eltrombopag is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. Moderate. Study
- Eltrombopag decreases the exposure to calcium channel blockers (diltiazem). (Severe) Study
- Eltrombopag decreases the exposure to calcium channel blockers (isradipine). Avoid. (Moderate) Study
- Eltrombopag is predicted to decrease the exposure to calcium channel blockers (verapamil). (Severe) Study
- Eltrombopag is predicted to decrease the exposure to cannabis extract. Avoid. (Severe) Theoretical
- Eltrombopag is predicted to decrease the exposure to ceritinib. Avoid. (Severe) Study
- Eltrombopag decreases the concentration of ciclosporin. (Severe) Study
- Eltrombopag is predicted to alter the effects of cilostazol. (Moderate) Theoretical
Enzalutamide decreases the exposure to clomethiazole. Monitor and adjust dose. (Moderate) Study

Enzalutamide is predicted to decrease the exposure to cobicistat. Avoid. (Severe) Theoretical

Enzalutamide is predicted to decrease the exposure to cobimetinib. Avoid. (Severe) Theoretical

Enzalutamide is predicted to decrease the exposure to corticosteroids (budesonide, dexamethasone, methylprednisolone, prednisolone). Monitor and adjust dose. (Moderate) Study

Enzalutamide is predicted to decrease the exposure to corticosteroids (fluticasone). (Unknown) Theoretical

Enzalutamide is predicted to decrease the exposure to coumarins. (Moderate) Study

Enzalutamide potentially decreases the exposure to crizotinib. Avoid. (Severe) Study

Enzalutamide is predicted to markedly decrease the exposure to dabrafenib. Avoid. (Moderate) Theoretical

Enzalutamide is predicted to moderately decrease the exposure to daclatasvir. Avoid. (Severe) Study

Enzalutamide is predicted to decrease the exposure to dasabuvir. Avoid. (Severe) Theoretical

Enzalutamide is predicted to markedly decrease the exposure to dasatinib. Avoid. (Severe) Study

Enzalutamide is predicted to slightly decrease the exposure to delamanid. Avoid. (Moderate) Study

Enzalutamide decreases the exposure to dolasetron. Adjust dose. (Severe) Study

Enzalutamide is predicted to decrease the exposure to elbasvir. Avoid. (Severe) Study

Enzalutamide is predicted to decrease the concentration of elvitegravir. Avoid. (Severe) Theoretical

Enzalutamide is predicted to decrease the effects of ergotamine. (Moderate) Theoretical

Enzalutamide is predicted to decrease the exposure to erlotinib. Avoid or adjust erlotinib dose. (Severe) Study

Enzalutamide is predicted to decrease the exposure to etravirine. Avoid. (Severe) Theoretical

Enzalutamide is predicted to decrease the concentration of everolimus. Avoid or adjust dose. (Severe) Study

Enzalutamide moderately decreases the exposure to exemestane. (Moderate) Study

Enzalutamide is predicted to decrease the exposure to fesoterodine. Avoid. (Moderate) Study

Fibrates (gemfibrozil) moderately increase the exposure to enzalutamide. Avoid or adjust enzalutamide dose. (Severe) Study

Enzalutamide is predicted to decrease the exposure to fingolimod. (Moderate) Study

Enzalutamide is predicted to decrease the exposure to gefitinib. Avoid. (Severe) Study

Enzalutamide is predicted to decrease the exposure to gefitinib. Avoid. (Moderate) Theoretical

Enzalutamide is predicted to decrease the exposure to grazeoprevir. Avoid. (Severe) Study

Enzalutamide is predicted to decrease the concentration of guanfacine. Adjust guanfacine dose, p. 222. (Moderate) Study

Enzalutamide decreases the concentration of haloperidol. Adjust dose. (Moderate) Study

Enzalutamide is predicted to decrease the exposure to ibritinib. Avoid. (Severe) Study

Enzalutamide is predicted to decrease the exposure to idelalisib. Avoid. (Severe) Study

Enzalutamide is predicted to decrease the exposure to imatinib. Avoid. (Moderate) Study

Enzalutamide is predicted to decrease the exposure to imatinib. Avoid. (Severe) Study

Enzalutamide is predicted to decrease the exposure to irinotecan. Avoid. (Severe) Study

Enzalutamide is predicted to decrease the exposure to ivabradine. Adjust dose. (Moderate) Theoretical

Enzalutamide markedly decreases the exposure to ivacaftor. Avoid. (Severe) Study

Enzalutamide is predicted to decrease the exposure to ixazomib. Avoid. (Severe) Study

Enzalutamide is predicted to decrease the exposure to lapatinib. Avoid. (Severe) Study

Enzalutamide is predicted to decrease the exposure to lomitapide. Monitor and adjust dose. (Moderate) Theoretical

Enzalutamide is predicted to decrease the exposure to lurasidone. Avoid. (Moderate) Study

Enzalutamide is predicted to decrease the exposure to macitentan. Avoid. (Severe) Study

Enzalutamide is predicted to decrease the exposure to maraviroc. Adjust dose. (Severe) Study

Enzalutamide is predicted to decrease the exposure to midazolam. Monitor and adjust dose. (Moderate) Study

Enzalutamide is predicted to decrease the exposure to mirtazapine. Adjust dose. (Moderate) Study

Enzalutamide is predicted to decrease the exposure to monoclonal antibodies (trastuzumab emtansine). (Severe) Theoretical

Enzalutamide is predicted to decrease the exposure to montelukast. (Moderate) Study

Enzalutamide is predicted to markedly decrease the exposure to poxegal. Avoid. (Moderate) Study

Enzalutamide is predicted to slightly decrease the exposure to nateglinide. (Moderate) Study

Enzalutamide is predicted to decrease the exposure to netupitant. Avoid. (Moderate) Study

Enzalutamide is predicted to moderately decrease the exposure to nilotinib. Avoid. (Severe) Study

Enzalutamide is predicted to decrease the exposure to nitisinone. Adjust nitisinone dose. (Moderate) Theoretical

Enzalutamide is predicted to decrease the exposure to olaparib. Avoid. (Moderate) Theoretical

Enzalutamide is predicted to decrease the exposure to ondansetron. (Moderate) Study

Enzalutamide is predicted to decrease the exposure to opioids (alfentanil, fentanyl). (Moderate) Study

Enzalutamide is predicted to decrease the exposure to opioids (buprenorphine). Monitor and adjust dose. (Moderate) Theoretical

Enzalutamide decreases the exposure to opioids (methadone). Monitor and adjust dose. (Severe) Study

Enzalutamide is predicted to decrease the exposure to opioids (oxycodeone). Monitor and adjust dose. (Moderate) Study

Enzalutamide is predicted to decrease the exposure to paracetamol. (Moderate) Study

Enzalutamide is predicted to decrease the exposure to pariparavir with ritonavir and ombitasvir. Avoid. (Severe) Study

Enzalutamide is predicted to decrease the exposure to pazopanib. Avoid. (Severe) Theoretical

Enzalutamide is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (avanafil, tadalafil). Avoid. (Severe) Study

Enzalutamide is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (sildenafil, vardenafil, vardenafil). (Moderate) Theoretical

Enzalutamide is predicted to decrease the exposure to pitolisant. (Moderate) Study

Enzalutamide is predicted to decrease the exposure to ponatinib. Avoid. (Moderate) Theoretical

Enzalutamide is predicted to markedly decrease the exposure to praziquantel. Avoid. (Moderate) Study

Enzalutamide is predicted to markedly decrease the exposure to proton pump inhibitors (omeprazole). (Moderate) Study

Enzalutamide is predicted to decrease the exposure to quetiapine. (Moderate) Study

Enzalutamide is predicted to decrease the exposure to ranolazine. Avoid. (Severe) Study
Enzalutamide (continued)

- **Enzalutamide** is predicted to decrease the exposure to **reboxetine**. (Moderate) Anecdotal
- **Enzalutamide** is predicted to decrease the concentration of **sirolimus**. Avoid. (Severe) Study
- **Enzalutamide** is predicted to decrease the exposure to **taxanes** (*cabazitaxel, paclitaxel*). Avoid. (Severe) Study
- **Enzalutamide** is predicted to decrease the concentration of **temsirolimus**. Avoid. (Severe) Study
- **Enzalutamide** is predicted to markedly decrease the exposure to **tetracyclines** (*doxycycline*). Monitor and adjust dose. (Moderate) Study
- **Enzalutamide** is predicted to decrease the exposure to **tolvaptan**. Avoid. (Severe) Study
- **Enzalutamide** is predicted to decrease the exposure to **temsirolimus**. Avoid. (Severe) Study
- **Enzalutamide** is predicted to decrease the exposure to **tiofemine**. Adjust dose. (Moderate) Study
- **Enzalutamide** is predicted to decrease the exposure to **trabectedin**. Avoid. (Severe) Theoretical
- **Enzalutamide** is predicted to markedly decrease the exposure to **ulipristal**. Avoid and for 4 weeks after stopping ulipristal. (Severe) Theoretical
- **Enzalutamide** is predicted to decrease the exposure to **vandetanib**. Avoid. (Moderate) Study
- **Enzalutamide** is predicted to moderately decrease the exposure to **velpatasvir**. Avoid. (Severe) Study
- **Enzalutamide** is predicted to decrease the exposure to **vemurafenib**. Avoid. (Severe) Theoretical
- **Enzalutamide** is predicted to decrease the exposure to **venetoclax**. Avoid. (Severe) Study
- **Enzalutamide** is predicted to decrease the exposure to **vinca alkaloids** (*vinblastine, vincristine, vindesine*). (Severe) Theoretical
- **Enzalutamide** is predicted to decrease the exposure to **vinca alkaloids** (*vinfunine*). Avoid. (Severe) Theoretical
- **Enzalutamide** is predicted to decrease the exposure to **vinorelbine**. Use with caution or avoid. (Severe) Theoretical
- **Enzalutamide** is predicted to decrease the exposure to **vismodegib**. Avoid. (Moderate) Theoretical
- **Enzalutamide** is predicted to decrease the exposure to **vortioxetine**. Monitor and adjust dose. (Moderate) Study
- **Enzalutamide** is predicted to decrease the exposure to **zopiclone**. Adjust dose. (Moderate) Study

**Ephedrine** → see sympathomimetics, vasocostrictr
**Epirubicin** → see anthracyclines

**Eplerenone** → see aldosterone antagonists
**Epoetin alfa** → see TABLE 5 p. 818 (thromboembolism), TABLE 16 p. 822 (increased serum potassium)
**Epoetin beta** → see TABLE 5 p. 818 (thromboembolism), TABLE 16 p. 822 (increased serum potassium)
**Epoetin zeta** → see TABLE 5 p. 818 (thromboembolism), TABLE 16 p. 822 (increased serum potassium)
**Epoprostenol** → see TABLE 4 p. 818 (antiplatelet effects)
**Eprosartan** → see angiotensin-II receptor antagonists
**Epitifibatide** → see TABLE 4 p. 818 (antiplatelet effects)
**Ergocalciferol** → see vitamin D substances

**Ergometrine**

- **Antiaarrhythmics** (*droterodine*) are predicted to increase the risk of ergotism when given with ergometrine. (Severe) Theoretical
- **Antifungals, azoles** (*fluconazole, itraconazole, posaconazole*) are predicted to increase the risk of ergotism when given with ergometrine. (Severe) Theoretical
- **Antifungals, azoles** (*itraconazole, ketoconazole, voriconazole*) are predicted to increase the risk of ergotism when given with ergometrine. Avoid. (Severe) Theoretical
- **Apregitant** is predicted to increase the risk of ergotism when given with ergometrine. (Severe) Theoretical
- **Beta blockers, non-selective** are predicted to increase the risk of peripheral vasoconstriction when given with ergometrine. (Severe) Theoretical
- **Beta blockers, selective** are predicted to increase the risk of peripheral vasoconstriction when given with ergometrine. (Severe) Theoretical
- **Calcium channel blockers** (*diltiazem, verapamil*) are predicted to increase the risk of ergotism when given with ergometrine. (Severe) Theoretical
- **Cobicistat** is predicted to increase the risk of ergotism when given with ergometrine. Avoid. (Severe) Theoretical
- **Crizotinib** is predicted to increase the risk of ergotism when given with ergometrine. (Severe) Theoretical
- **Ergometrine** is predicted to increase the risk of ergotism when given with dopaminergic receptor agonists (*cabergoline, pergolide*). Avoid. (Moderate) Theoretical
- **Grapefruit juice** is predicted to increase the risk of ergotism when given with ergometrine. (Severe) Theoretical
- **HIV-protease inhibitors** (*atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir*) are predicted to increase the risk of ergotism when given with ergometrine. Avoid. (Severe) Theoretical
- **HIV-protease inhibitors** (*indinavir*) are predicted to increase the risk of ergotism when given with ergometrine. Avoid. (Severe) Theoretical
- **Idealalisib** is predicted to increase the risk of ergotism when given with ergometrine. Avoid. (Severe) Theoretical
- **Imatinib** is predicted to increase the risk of ergotism when given with ergometrine. Avoid. (Severe) Theoretical
- **Macrolides** (*clarithromycin*) are predicted to increase the risk of ergotism when given with ergometrine. Avoid. (Severe) Theoretical
- **Macrolides** (*erythromycin*) are predicted to increase the risk of ergotism when given with ergometrine. Avoid. (Severe) Theoretical
- **Netupitant** is predicted to increase the risk of ergotism when given with ergometrine. (Severe) Theoretical
- **Nilotinib** is predicted to increase the risk of ergotism when given with ergometrine. (Severe) Theoretical
- **Ergometrine** potentially increases the risk of peripheral vasoconstriction when given with sympathomimetics, inotropic (dopamine) . Avoid. (Severe) Anecdotal
- **Ergometrine** is predicted to increase the risk of peripheral vasoconstriction when given with sympathomimetics, vasocostrictr (*noradrenaline/norepinephrine*). Avoid. (Severe) Anecdotal
- **Almotriptan** is predicted to increase the risk of vasoconstriction when given with ergotamine. Ergotamine should be taken at least 24 hours before or 6 hours after almotriptan. (Severe) Theoretical
Antiarrhythmics (dronedarone) are predicted to increase the risk of ergotism when given with ergotamine. **Severe** Theoretical

Antiarrhythmics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the effects of ergotamine. **Moderate** Theoretical

Antifungals, azoles (itraconazole, isavuconazole, posaconazole) are predicted to increase the risk of ergotism when given with ergotamine. **Severe** Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to decrease the absorption of ergotamine. **Severe** Theoretical

Antifungal, azoles (fluconazole, itraconazole, voriconazole) are predicted to increase the risk of ergotism when given with ergotamine. Avoid. **Severe** Theoretical

Antifungals, azoles (miconazole) are predicted to increase the exposure to ergotamine. Avoid. **Severe** Theoretical

Aprepitant is predicted to increase the risk of ergotism when given with ergotamine. **Severe** Theoretical

Beta blockers, non-selective are predicted to increase the risk of peripheral vasoconstriction when given with ergotamine. **Severe** Study

Beta blockers, selective are predicted to increase the risk of peripheral vasoconstriction when given with ergotamine. **Severe** Study

Bosentan is predicted to decrease the effects of ergotamine. **Moderate** Theoretical

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the risk of ergotism when given with ergotamine. **Severe** Theoretical

Ceritinib is predicted to increase the exposure to ergotamine. Avoid. **Severe** Theoretical

Cobicistat is predicted to increase the risk of ergotism when given with ergotamine. Avoid. **Severe** Theoretical

Crizotinib is predicted to increase the risk of ergotism when given with ergotamine. **Severe** Theoretical

Erlotinib increases the risk of vasoconstriction when given with ergotamine. Separate administration by 24 hours. **Severe** Study

Enalapril increases the risk of ergotism when given with ergotamine. **Severe** Theoretical

Enalapril is predicted to decrease the effects of ergotamine. **Moderate** Theoretical

Grapefruit juice is predicted to increase the exposure to ergotamine. **Severe** Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the risk of ergotism when given with ergotamine. Avoid. **Severe** Theoretical

HIV-protease inhibitors (indinavir) are predicted to increase the risk of ergotism when given with ergotamine. **Severe** Theoretical

Idelalisib is predicted to increase the risk of ergotism when given with ergotamine. **Severe** Theoretical

Imatinib is predicted to increase the risk of ergotism when given with ergotamine. **Severe** Theoretical

Itraconazole, ketoconazole, voriconazole are predicted to decrease the effects of ergotamine. **Moderate** Theoretical

Nevirapine is predicted to decrease the effects of ergotamine. **Moderate** Theoretical

Nilotinib is predicted to increase the risk of ergotism when given with ergotamine. **Severe** Theoretical

Palbociclib is predicted to increase the exposure to ergotamine. Adjust dose. **Moderate** Theoretical

Rifampicin is predicted to decrease the effects of ergotamine. **Moderate** Theoretical

Rizatriptan is predicted to increase the risk of vasoconstriction when given with ergotamine. Ergotamine should be taken at least 24 hours before or 6 hours after rizatriptan. **Severe** Theoretical

St John’s Wort is predicted to decrease the effects of ergotamine. **Moderate** Theoretical

Sumatriptan increases the risk of vasoconstriction when given with ergotamine. Ergotamine should be taken at least 24 hours before or 6 hours after sumatriptan. **Severe** Study

Eribulin → see TABLE 15 p. 821 (myelosuppression), TABLE 12 p. 821 (peripheral neuropathy), TABLE 9 p. 820 (QT-interval prolongation)

Erlotinib

**FOOD AND LIFESTYLE** Dose adjustment may be necessary if smoking started or stopped during treatment.

Antacids are predicted to decrease the absorption of erlotinib. Antacids should be taken 4 hours before or 2 hours after erlotinib. **Moderate** Theoretical

Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to erlotinib. **Moderate** Theoretical

Antiarrhythmics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to erlotinib. Avoid or adjust erlotinib dose. **Severe** Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to decrease the effects of erlotinib. **Moderate** Theoretical

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to erlotinib. **Severe** Study

Avoid or adjust erlotinib dose. **Severe** Study

Bosentan is predicted to decrease the exposure to erlotinib. **Severe** Theoretical

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to erlotinib. **Severe** Theoretical

Ciclosporin is predicted to increase the exposure to erlotinib. **Moderate** Theoretical

Cobicistat is predicted to slightly increase the exposure to erlotinib. Use with caution and adjust dose. **Moderate** Study

Combined hormonal contraceptives slightly increase the exposure to erlotinib. Monitor side effects and adjust dose. **Moderate** Study

Corticosteroids increase the risk of gastrointestinal perforation when given with aspirin (high-dose). **Severe** Theoretical

Erlotinib increases the anticoagulant effect of coumarins. **Severe** Antedotal

Crizotinib is predicted to increase the exposure to erlotinib. **Moderate** Theoretical

Efavirenz is predicted to decrease the exposure to erlotinib. **Severe** Theoretical

Enalapril is predicted to decrease the exposure to erlotinib. **Severe** Theoretical

Enalapril is predicted to increase the exposure to erlotinib. **Severe** Study

Grapefruit juice is predicted to increase the exposure to erlotinib. **Severe** Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to erlotinib. **Severe** Study

HIV-protease inhibitors (indinavir) are predicted to increase the exposure to erlotinib. **Severe** Study

Combined hormonal contraceptives slightly increase the exposure to erlotinib. **Severe** Study

Enalapril is predicted to increase the exposure to erlotinib. Avoid or adjust erlotinib dose. **Severe** Study

Grapefruit juice is predicted to increase the exposure to erlotinib. **Moderate** Theoretical

H₂ receptor antagonists are predicted to decrease the exposure to erlotinib. Erlotinib should be taken 2 hours before or 10 hours after H₂ receptor antagonists. **Moderate** Study

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to slightly increase the exposure to erlotinib. Use with caution and adjust dose. **Moderate** Study

HIV-protease inhibitors (indinavir) are predicted to increase the exposure to erlotinib. **Moderate** Theoretical

Idelalisib is predicted to slightly increase the exposure to erlotinib. **Moderate** Theoretical

Lapatinib is predicted to increase the exposure to erlotinib. **Moderate** Theoretical

Macrolides (azithromycin, erythromycin) are predicted to increase the exposure to erlotinib. **Moderate** Theoretical
Erlotinib (continued)

- **Macrolides** (clarithromycin) are predicted to slightly increase the exposure to erlotinib. Use with caution and adjust dose. [Moderate] Study
- **Netupitant** is predicted to increase the exposure to erlotinib. [Severe] Theoretical
- **Nevirapine** is predicted to decrease the exposure to erlotinib. [Severe] Theoretical
- **Nilotinib** is predicted to increase the exposure to erlotinib. [Moderate] Theoretical
- **Erlotinib** is predicted to increase the risk of gastrointestinal perforation when given with **NSAIDs**. [Severe] Theoretical
- **Erlotinib** is predicted to increase the risk of bleeding events when given with **phenindione**. [Severe] Theoretical
- **Proton pump inhibitors** are predicted to slightly decrease the exposure to erlotinib. Avoid. [Moderate] Study
- **Quinolones** (ciprofloxacin) slightly increase the exposure to erlotinib. Monitor side effects and adjust dose. [Moderate] Study
- **Ranolazine** is predicted to increase the exposure to erlotinib. [Severe] Theoretical
- **Rifampicin** is predicted to decrease the exposure to erlotinib. Avoid or adjust erlotinib dose. [Severe] Study
- **SSRIs** (fluvoxamine) are predicted to increase the exposure to erlotinib. Monitor side effects and adjust dose. [Moderate] Theoretical
- **St John’s Wort** is predicted to decrease the exposure to erlotinib. [Severe] Theoretical
- **Venlafaxine** is predicted to increase the exposure to erlotinib. [Moderate] Theoretical
- **Ertapenem** → see carbapenems
- **Erythromycin** → see macrolides
- **Escitalopram** → see SSRIs
- **Esomeprazole** → see proton pump inhibitors
- **Esmolol** → see beta blockers, selective
- **Esomeprazole** → see alkylating agents
- **Etoricoxib** → see NSAIDs
- **Etoritocib** → see NSAIDs

**Etoritocib** → see NSAIDs

**Estramustine** is predicted to decrease the efficacy of etoritocib. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical

**Etnoplanetan** is predicted to increase the risk of optic neuropathy when given with **etnoplanetan**. [Severe] Anecdotal

**Ethosuximide** → see antiepileptics

**Etodolac** → see NSAIDs

**Etomide** → see TABLE 8 p. 819 (hypotension), TABLE 11 p. 820 (CNS depressant effects)

**Etonogestrel**

- **Antiepileptics** (carbamazepine, eslicarbazepine, fosphenytoin, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical
- **Apresoline** is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical
- **Bosentan** is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical
- **Efavirenz** is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical
- **Fosaprepitant** is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical
- **Griseofulvin** decreases the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Anecdotal
- **HIV-protease inhibitors (ritonavir)** are predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical
- **Modafinil** is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical
- **Nevirapine** is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical
- **Rifabutin** decreases the exposure to etonogestrel. [Moderate] Study
- **Rifabutin** decreases the exposure to etonogestrel. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to etonogestrel. Avoid. [Severe] Theoretical
- **St John’s Wort** is predicted to decrease the efficacy of etonogestrel. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical
- **Sugammadex** is predicted to decrease the efficacy of etonogestrel. Use additional contraceptive precautions. [Severe] Theoretical
- **Ulipristal** is predicted to decrease the efficacy of etonogestrel. Avoid. [Severe] Theoretical

**Etoposide** → see TABLE 15 p. 821 (myelosuppression)

- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the efficacy of etoposide. [Moderate] Study
- **Ciclosporin** increases the exposure to etoposide. Monitor and adjust dose. [Severe] Study
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with etoposide. Public Health England advises avoid. [Severe] Theoretical
- **Nivolumab** is predicted to decrease the exposure to etoposide. Monitor and adjust dose. [Severe] Study
- **Erlotinib** is predicted to decrease the exposure to bosutinib. Avoid. [Severe] Theoretical
- **Erlotinib** increases the anticoagulant effect of coumarins. [Moderate] Theoretical
- **Erlotinib** is predicted to decrease the exposure to dalcatasvir. Avoid. [Moderate] Theoretical
- **Erlotinib** moderately decreases the exposure to dolastegavir. Avoid unless given with atazanavir, darunavir, or lopinavir (all boosted with ritonavir). [Severe] Study
- **Efavirenz** is predicted to decrease the exposure to etoposide. Avoid. [Severe] Study
- **Erlotinib** is predicted to decrease the exposure to elbasvir. Avoid. [Unknown] Theoretical
- **Erlotinib** increases the exposure to HIV-protease inhibitors (fosamprenavir) boosted with ritonavir. Refer to specialist literature. [Moderate] Study
- **Erlotinib** is predicted to decrease the exposure to HIV-protease inhibitors (Indinavir). Avoid. [Severe] Theoretical
- **Erlotinib** decreases the exposure to macrolides (clarithromycin). [Severe] Study
- **Erlotinib** (with a boosted protease inhibitor) increases the exposure to maraviroc. Avoid or adjust dose. [Moderate] Study
- **Nevirapine** is predicted to decrease the exposure to etoposide. Avoid. [Severe] Study
- **Erlotinib** moderately decreases the exposure to phosphodiesterase type-5 inhibitors. Adjust dose. [Moderate] Study
- **Rifampicin** decreases the exposure to etoposide. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to etoposide. Avoid. [Severe] Theoretical
**Etravirine** is predicted to decrease the exposure to **rilpivirine**. Avoid. **Severe** Theoretical

**Etravirine** is predicted to decrease the exposure to **simprevir**. Avoid. **Moderate** Study

**St John's Wort** is predicted to decrease the exposure to **etorviren**. Avoid. **Severe** Study

**Evelarim** → see TABLE 15 p. 821 (myelosuppression)

**Antiarrhythmics** (**dronedarone**) are predicted to increase the concentration of **everolimus**. Avoid or adjust dose. **Moderate** Study

**Antiepileptics** (**carbamazepine**, **foshenoytin**, **phenobarbital**, **phenytin**, **primidone**) are predicted to decrease the concentration of **everolimus**. Avoid or adjust dose. **Severe** Study

**Antifungals**, **azoles** (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **everolimus**. Avoid or adjust dose. **Moderate** Study

**Antifungals**, **azoles** (**itraconazole**, **ketoconazole**, **vороconazole**) are predicted to increase the concentration of **everolimus**. Avoid. **Severe** Study

**Aprepitant** is predicted to increase the concentration of **everolimus**. Avoid or adjust dose. **Moderate** Study

**Bosentan** is predicted to increase the concentration of **everolimus**. Avoid or adjust dose. **Moderate** Study

**Calcium channel blockers** (**diltiazem**, **verapamil**) are predicted to increase the concentration of **everolimus**. Avoid or adjust dose. **Moderate** Study

**Ciclosporin** is predicted to decrease the exposure to **everolimus**. **Theoretical** → Also see TABLE 15 p. 821

**Ciclosporin** moderately increases the exposure to **everolimus**. Avoid or adjust dose. **Severe** Study

**Cobicistat** is predicted to increase the concentration of **everolimus**. Avoid. **Severe** Study

**Crizotinib** is predicted to increase the concentration of **everolimus**. Avoid or adjust dose. **Moderate** Study → Also see TABLE 15 p. 821

**Efavirenz** is predicted to decrease the concentration of **everolimus**. Avoid or adjust dose. **Severe** Study

**Enzalutamide** is predicted to decrease the concentration of **everolimus**. Avoid or adjust dose. **Severe** Study

**Grapefruit juice** is predicted to increase the exposure to **everolimus**. Avoid. **Severe** Theoretical

**HIV-protease inhibitors** (**atazanavir**, **darunavir**, **fosamprenavir**, **lopinavir, ritonavir, saquinavir, tipranavir**) are predicted to increase the concentration of **everolimus**. Avoid. **Severe** Study

**HIV-protease inhibitors** (**indinavir**) are predicted to increase the concentration of **everolimus**. Avoid or adjust dose. **Moderate** Study

**Idelalisib** is predicted to increase the concentration of **everolimus**. Avoid. **Severe** Study → Also see TABLE 15 p. 821

**Imatinib** is predicted to increase the concentration of **everolimus**. Avoid or adjust dose. **Moderate** Study → Also see TABLE 15 p. 821

**Lapatinib** is predicted to increase the exposure to **everolimus**. **Moderate** Theoretical

**Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **everolimus**. Public Health England advises avoid. **Severe** Theoretical

**Everolimus** is predicted to increase the exposure to **trematipide**. Separate administration by 12 hours. **Moderate** Theoretical

**Lumacaftor** is predicted to decrease the exposure to **everolimus**. Avoid. **Severe** Theoretical

**Macrolides** (**clarithromycin**) are predicted to increase the concentration of **everolimus**. Avoid. **Severe** Study

**Macrolides** (**erythromycin**) are predicted to increase the concentration of **everolimus**. Avoid or adjust dose. **Moderate** Study

**Mirabegron** is predicted to increase the exposure to **everolimus**. **Mild** Theoretical

**Netupitant** is predicted to increase the concentration of **everolimus**. Avoid or adjust dose. **Moderate** Study

**Nevirapine** is predicted to decrease the concentration of **everolimus**. Avoid or adjust dose. **Severe** Study

**Nilotinib** is predicted to increase the concentration of **everolimus**. Avoid or adjust dose. **Moderate** Study → Also see TABLE 15 p. 821

**Palbociclib** is predicted to increase the exposure to **everolimus**. Adjust dose. **Moderate** Theoretical

**Pitolisant** is predicted to decrease the exposure to **everolimus**. Avoid. **Severe** Theoretical

**Rifampicin** is predicted to decrease the concentration of **everolimus**. Avoid or adjust dose. **Severe** Study

**St John's Wort** is predicted to decrease the concentration of **everolimus**. Avoid or adjust dose. **Severe** Study

**Velpatasvir** is predicted to increase the exposure to **everolimus**. **Severe** Theoretical

**Ecorocumab** → see monoclonal antibodies

**Ezetimibe**

**Antiarrhythmics** (**carbamazepine**, **foshenoytin**, **phenobarbital**, **phenytin**, **primidone**) moderately decrease the exposure to **exemastane**. **Moderate** Study

**Enzalutamide** moderately decreases the exposure to **exemastane**. **Moderate** Study

**Rifampicin** moderately decreases the exposure to **exemastane**. **Moderate** Study

**St John's Wort** is predicted to decrease the exposure to **exemastane**. **Moderate** Theoretical

**Exenatide** → see TABLE 14 p. 821 (antidiabetic drugs)

**Separation of administration** With standard-release exenatide: some orally administered drugs should be taken at least 1 hour before, or 4 hours after, exenatide injection.

**Ezetimibe**

**Ciclosporin** moderately increases the exposure to **ezetimibe** and **ezetimibe** slightly increases the exposure to **ciclosporin**. **Moderate** Study

**Fibates** are predicted to increase the risk of gallstones when given with **ezetimibe**. **Severe** Theoretical

**Ezetimibe** potentially increases the risk of rhabdomyolysis when given with **statins**. **Severe** Anecdotal

**Famotidine** → see **H2** receptor antagonists

**Fampridine**

**H2** receptor antagonists (**cimetidine**) increase the concentration of **fampridine**. Avoid. **Severe** Theoretical

**Fexubostat**

**Fexubostat** is predicted to increase the exposure to **azathioprine**. Avoid. **Severe** Theoretical

**Fexubostat** is predicted to increase the exposure to **didanosine**. **Severe** Theoretical

**Fexubostat** is predicted to increase the exposure to **mercaptopurine**. Avoid. **Severe** Theoretical

**Felbinac** → see **NSAIDs**

**Felimidine** → see calcium channel blockers

**Fenofibrate** → see **fibrates**

**Fenoprofen** → see **NSAIDs**

**Fentanyl** → see opioids

**Ferric carboxymaltose** → see iron (**injectable**) **Ferric maltol** → see iron (**oral**) **Ferrous fumarate** → see iron (**oral**) **Ferrous gluconate** → see iron (**oral**) **Ferrous sulfate** → see iron (**oral**) **Fesoterodine** → see TABLE 10 p. 820 (antimuscarinics)

**Antiarrhythmics** (**dronedarone**) are predicted to increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose in hepatic and renal impairment. **Mild** Study

**Antiarrhythmics** (**carbamazepine**, **foshenoytin**, **phenobarbital**, **phenytin**, **primidone**) are predicted to decrease the exposure to **fesoterodine**. Avoid. **Moderate** Study

**Antifungals**, **azoles** (**fluconazole**, **isavuconazole**, **posaconazole**) are predicted to increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose in hepatic and renal impairment. **Mild** Study

**Antifungals**, **azoles** (**itraconazole**, **ketoconazole**, **vороconazole**) are predicted to moderately increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose; avoid in hepatic and renal impairment. **Severe** Study

**Aprepitant** is predicted to increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose in hepatic and renal impairment. **Mild** Study
Fesoterodine

- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose in hepatic and renal impairment. [Mild] Study
- Cobicistat is predicted to moderately increase the exposure to fesoterodine. Adjust fesoterodine dose; avoid in hepatic and renal impairment. [Severe] Study
- Crizotinib is predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose in hepatic and renal impairment. [Mild] Study
- Enzalutamide is predicted to decrease the exposure to fesoterodine. Avoid. [Moderate] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to moderately increase the exposure to fesoterodine. Adjust fesoterodine dose; avoid in hepatic and renal impairment. [Severe] Study

Fibrates

- Antacids slightly to moderately decrease the exposure to gemfibrozil. [Moderate] Study
- Bezafibrate is predicted to increase the risk of nephrotoxicity when given with ciraspordin. [Severe] Theoretical
- Ciprofibrate increases the risk of nephrotoxicity when given with cirtospordin. [Severe] Study
- Colchicine increases the risk of rhabdomyolysis when given with fibrates. [Severe] Anecdotal
- Fibrates are predicted to increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. [Severe] Study
- Gemfibrozil is predicted to increase the exposure to dabrafenib. [Moderate] Theoretical
- Gemfibrozil is predicted to increase the risk of rhabdomyolysis when given with daptomycin. [Severe] Theoretical
- Gemfibrozil very markedly increases the exposure to dasabuvir. Avoid. [Severe] Study
- Gemfibrozil moderately increases the exposure to enzalutamide. Avoid or adjust enzalutamide dose. [Severe] Study
- Fibrates are predicted to increase the risk of gallstones when given with ezetimibe. [Severe] Theoretical
- Fibrates are predicted to increase the risk of hypoglycaemia when given with insulins. [Moderate] Theoretical
- Gemfibrozil is predicted to moderately increase the exposure to montelukast. [Moderate] Study
- Fibrates are predicted to increase the anticoagulant effect of phenindione. Monitor INR and adjust dose. [Severe] Study
- Gemfibrozil markedly increases the exposure to pioglitazone. Monitor blood glucose and adjust dose. [Severe] Study
- Gemfibrozil markedly increases the exposure to repaglinide. Avoid. [Severe] Study
- Gemfibrozil is predicted to increase the exposure to retinoids (alitretinoin). Adjust alitretinoin dose. [Moderate] Theoretical
- Gemfibrozil increases the concentration of retinoids (bexarotene). Avoid. [Severe] Study
- Gemfibrozil is predicted to increase the exposure to selexipag. Avoid. [Severe] Theoretical
- Ciprofibrate increases the risk of rhabdomyolysis when given with statins (atorvastatin). Avoid or adjust dose. [Severe] Study
- Bezafibrate increases the risk of rhabdomyolysis when given with statins (atorvastatin, fluvastatin). [Severe] Study
- Fenofibrate increases the risk of rhabdomyolysis when given with statins (atorvastatin, simvastatin). Adjust fenofibrate dose, p. 127. [Severe] Anecdotal
- Ciprofibrate increases the risk of rhabdomyolysis when given with statins (fluvastatin). [Severe] Study
- Fenofibrate is predicted to increase the risk of rhabdomyolysis when given with statins (fluvastatin). Adjust fenofibrate dose, p. 127. [Severe] Theoretical
- Fenofibrate is predicted to increase the risk of rhabdomyolysis when given with statins (pravastatin). Avoid. [Severe] Theoretical
- Fibrates (bezafibrate, ciprofibrate) increase the risk of rhabdomyolysis when given with statins (pravastatin). Avoid. [Severe] Theoretical

Fenofibrate

- Ciprofibrate increases the risk of rhabdomyolysis when given with statins (rosuvastatin). Adjust fenofibrate and rosuvastatin doses, p. 127, p. 130. [Severe] Anecdotal
- Fibrates (bezafibrate, ciprofibrate) increase the risk of rhabdomyolysis when given with statins (rosuvastatin). Adjust rosuvastatin dose, p. 130. [Severe] Study
- Fibrates (bezafibrate, ciprofibrate) increase the risk of rhabdomyolysis when given with statins (simvastatin). Adjust simvastatin dose, p. 130. [Severe] Study
- Gemfibrozil increases the risk of rhabdomyolysis when given with statins. Avoid. [Severe] Anecdotal
- Fibrates are predicted to increase the risk of hypoglycaemia when given with sulfonfonylureas. [Moderate] Theoretical
- Fibrates are predicted to decrease the efficacy of ursodeoxycholic acid. Avoid. [Severe] Theoretical

Fidaxomicin

- Antifungal, oxoazoles (itraconazole, ketoconazole) are predicted to increase the exposure to fidaxomicin. Avoid. [Moderate] Study
- Ciprofibrate increases the risk of nephrotoxicity when given with cirtospordin. [Severe] Theoretical
- Fibrates are predicted to decrease the exposure to fidaxomicin. Avoid. [Moderate] Study
- Cricospordin is predicted to increase the exposure to fidaxomicin. Avoid. [Moderate] Study
- Fibrates are predicted to decrease the exposure to fidaxomicin. Avoid. [Moderate] Study
- Macrolides are predicted to increase the exposure to fidaxomicin. Avoid. [Moderate] Study
- Ranolazine is predicted to increase the exposure to fidaxomicin. Avoid. [Moderate] Study
- Vemurafenib is predicted to increase the exposure to fidaxomicin. Avoid. [Moderate] Study
- Fingolimod is predicted to increase the exposure to fidaxomicin. Avoid. [Moderate] Study

Fingolimod

- Antithrombin (amiodarone, dronedarone) are predicted to increase the exposure to fingolimod. Avoid. [Moderate] Study
- Antifungal, oxoazoles (itraconazole, ketoconazole) are predicted to increase the exposure to fidaxomicin. Avoid. [Moderate] Study
- Ciprofibrate increases the risk of nephrotoxicity when given with cirtospordin. [Severe] Theoretical
- Bezafibrate is predicted to increase the exposure to fingolimod. [Moderate] Study
- Calcium channel blockers (verapamil) are predicted to increase the exposure to fidaxomicin. Avoid. [Moderate] Study
- HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the exposure to fidaxomicin. Avoid. [Moderate] Study
- Lopinavir is predicted to increase the exposure to fingolimod. [Moderate] Study
- Macrolides are predicted to increase the exposure to fingolimod. [Moderate] Study
- Fibrates are predicted to decrease the exposure to fingolimod. [Moderate] Study
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with fingolimod. Public Health England advises avoid. [Severe] Theoretical
- Bezafibrate is predicted to increase the exposure to fingolimod. [Moderate] Study
- Ciprofibrate increases the risk of nephrotoxicity when given with cirtospordin. [Severe] Theoretical
- Gemfibrozil increases the concentration of retinoids (bexarotene). Avoid. [Severe] Study
- Gemfibrozil is predicted to increase the exposure to selexipag. Avoid. [Severe] Theoretical
- Ciprofibrate is predicted to increase the exposure to selexipag. Avoid. [Severe] Theoretical
- Gemfibrozil increases the concentration of retinoids (bexarotene). Avoid. [Severe] Study
- Gemfibrozil is predicted to increase the exposure to selexipag. Avoid. [Severe] Theoretical
- Ciprofibrate increases the risk of rhabdomyolysis when given with statins (atorvastatin). Avoid or adjust dose. [Severe] Study
- Bezafibrate increases the risk of rhabdomyolysis when given with statins (atorvastatin, fluvastatin). [Severe] Study
- Fenofibrate increases the risk of rhabdomyolysis when given with statins (atorvastatin, simvastatin). Adjust fenofibrate dose, p. 127. [Severe] Anecdotal
- Ciprofibrate increases the risk of rhabdomyolysis when given with statins (fluvastatin). [Severe] Study
- Fenofibrate is predicted to increase the risk of rhabdomyolysis when given with statins (fluvastatin). Adjust fenofibrate dose, p. 127. [Severe] Theoretical
- Fibrates (bezafibrate, ciprofibrate) increase the risk of rhabdomyolysis when given with statins (pravastatin). Avoid. [Severe] Theoretical
St John's Wort is predicted to decrease the exposure to fingolimod. Avoid. [Moderate] Theoretical

Flavoxate → see TABLE 10 p. 820 (antimuscarinics)

Fliecaïnide → see antiarrhythmics

Fluoxacillin → see penicillins

Fluconazole → see antifungals, azoles

Fluctysine

Amphotericin increases the risk of toxicity when given with fluctysine. [Severe] Study

Cytarabine decreases the concentration of fluctysine. Avoid. [Severe] Study

Fludarabine → see TABLE 15 p. 821 (myelosuppression)

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with fludarabine. Public Health England advises avoid. [Severe] Theoretical

Fludarabine increases the risk of pulmonary toxicity when given with pentostatin. Avoid. [Severe] Study → Also see TABLE 15 p. 821

Fludrocortisone → see TABLE 17 p. 822 (reduced serum potassium)

Flucinolone

ROUTE-SPECIFIC INFORMATION With intravitreal use in adults: caution with concurrent administration of anticoagulant or antiplatelet drugs (higher incidence of conjunctival haemorrhage).

Fluorouracil → see TABLE 15 p. 821 (myelosuppression), TABLE 5 p. 818 (thromboembolism)

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

Fluorouracil increases the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Severe] Anecdotal

Fluorouracil increases the anticoagulant effect of coumarins. [Severe] Anecdotal

Folates (folic acid) are predicted to increase the risk of toxicity when given with fluorouracil. Avoid. [Severe] Theoretical

Folates (folic acid) are predicted to increase the risk of toxicity when given with fluorouracil. [Severe] Theoretical

H₂ receptor antagonists (cimetidine) slightly increase the exposure to fluorouracil. [Severe] Study

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with fluorouracil. Public Health England advises avoid. [Severe] Theoretical

Metronidazole increases the risk of toxicity when given with fluorouracil. [Severe] Study

Fluoxetine → see SSRIs

Flupenthixol → see TABLE 8 p. 819 (hypotension), TABLE 11 p. 820 (CNS depressant effects)

Flupenthixol is predicted to decrease side effects dopamine receptor agonists. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 819

Flupenthixol decreases the effects of levodopa. Avoid or monitor worsening parkinsonian symptoms. [Severe] Theoretical → Also see TABLE 8 p. 819

Fluphenazine → see phenothiazines

Flurazepam → see TABLE 11 p. 820 (CNS depressant effects)

HIV-protease inhibitors (ritonavir) are predicted to increase the exposure to flurazepam. Avoid. [Moderate] Theoretical

Flurbiprofen → see NSAIDs

Fluticasone → see corticosteroids

Fluvastatin → see statins

Fluvaxamine → see SSRIs

Folates

Folic acid • folic acid • levofolic acid

Folic acid decreases the concentration of antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone). Monitor concentration and adjust dose. [Severe] Study

Folic acid is predicted to decrease the concentration of antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone). [Severe] Theoretical

Folic acid is predicted to increase the risk of toxicity when given with fosaprepitant. [Severe] Anecdotal

Folinic acid increases the risk of toxicity when given with fosaprepitant. [Severe] Study

Folic acid is predicted to increase the risk of toxicity when given with fosaprepitant. Avoid. [Severe] Theoretical

Folinic acid is predicted to increase the risk of toxicity when given with fosaprepitant. [Severe] Theoretical

Folic acid is predicted to alter the effects of raltitrexed. Avoid. [Moderate] Theoretical

Folinic acid alters the effects of raltitrexed. Avoid. [Moderate] Study

Sulfasalazine decreases the absorption of folic acid. [Moderate] Study

Sulfasalazine is predicted to decrease the absorption of folic acid. [Moderate] Theoretical

Folic acid is predicted to increase the risk of tegafur toxicity when given with tegafur. [Severe] Theoretical

Folinic acid is predicted to increase the risk of toxicity when given with tegafur. [Severe] Theoretical

Folic acid → see folates

Folic acid → see folates

Fondaparinux → see TABLE 3 p. 818 (anticoagulant effects)

Formoterol → see beta₂ agonists

Fosaprepitant → see HIV-protease inhibitors

Fosaprepitant

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to fosaprepitant. Avoid. [Moderate] Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to fosaprepitant. [Moderate] Theoretical

Fosaprepitant is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Study

Fosaprepitant is predicted to increase the exposure to corticosteroids (dexamethasone, methylprednisolone). Monitor and adjust dose. [Moderate] Theoretical

Fosaprepitant is predicted to decrease the anticoagulant effect of coumarins. [Moderate] Theoretical

Fosaprepitant is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical

Enzalutamide is predicted to decrease the exposure to fosaprepitant. Avoid. [Moderate] Theoretical

Fosaprepitant is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical

Fosaprepitant is predicted to increase the concentration of guanfacine. [Moderate] Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to fosaprepitant. [Moderate] Theoretical

Fosaprepitant is predicted to decrease the effects of Hormone replacement therapy. [Moderate] Anecdotal

Fosaprepitant is predicted to slightly increase the exposure to ibrutinib. [Moderate] Theoretical

Idelalisib is predicted to increase the exposure to fosaprepitant. [Moderate] Theoretical

Fosaprepitant is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical

Fosaprepitant is predicted to increase the exposure to midazolam. [Moderate] Study
### Interactions

- **Fosaprepitant** is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 474. **Severe** Anecdotal
- **Fosaprepitant** is predicted to increase the exposure to pimozone. **Avoid.** **Severe** Theoretical
- **Rifampicin** is predicted to decrease the exposure to fosaprepitant. **Avoid.** **Moderate** Theoretical
- **St John’s Wort** is predicted to decrease the exposure to fosaprepitant. **Avoid.** **Moderate** Theoretical
- **Fosaprepitant** decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 474. **Severe** Anecdotal

### Grapefruit juice

- **Fosaprepitant** is predicted to greatly decrease the exposure to grapefruit juice. **Study** **Theoretical**

### Macrolides

- **Antiepileptics** are predicted to increase the exposure to gefitinib. **Moderate** Theoretical
- **Netupitant** is predicted to decrease the exposure to gefitinib. **Moderate** Theoretical
- **Live vaccines** are predicted to slightly to moderately increase the exposure to gefitinib. **Study** **Theoretical**
- **Fosaprepitant** is predicted to increase the exposure to gefitinib. **Moderate** Theoretical
- **Antacids** increase the exposure to gefitinib. **Study** **Theoretical**
- **Crizotinib** is predicted to increase the exposure to gefitinib. **Moderate** Theoretical
- **Nevirapine** is predicted to slightly decrease the exposure to gefitinib. **Study** **Theoretical**
- **Antiparkinsonian drugs** are predicted to increase the exposure to gefitinib. **Moderate** Theoretical
- **Grapefruit juice** moderately decreases the exposure to gefitinib. **Study** **Theoretical**

### Beta blockers

- **Atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir** are predicted to increase the exposure to gefitinib. **Moderate** Theoretical

### Statins

- **Anecdotal**
- **Fosaprepitant** decreases the exposure to statins. **Study** **Anecdotal**

### Beta blockers

- **Diabetes and metabolic disorders** are predicted to increase the exposure to gefitinib. **Study** **Theoretical**
- **Inhibitors of CYP3A4** are predicted to moderately increase the exposure to gefitinib. **Study** **Theoretical**

### Hydantoins

- **Dronedarone** increases the exposure to gefitinib. **Study** **Theoretical**
- **Idelalisib** is predicted to moderately increase the exposure to gefitinib. **Study** **Anecdotal**
- **Antiepileptics** are predicted to increase the exposure to gefitinib. **Moderate** Theoretical
- **Fosaprepitant** is predicted to increase the exposure to gefitinib. **Moderate** Theoretical
- **Anticoagulants** are predicted to decrease the exposure to gefitinib. **Moderate** Theoretical
- **HIV-1 protease inhibitors** (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to gefitinib. **Moderate** Theoretical

### Fosaprepitant

- **Fosaprepitant** is predicted to decrease the exposure to gefitinib. **Moderate** Theoretical
- **Idelalisib** is predicted to increase the exposure to gefitinib. **Study** **Also see TABLE 15 p. 821
- **Imatinib** is predicted to increase the exposure to gefitinib. **Moderate** Theoretical **Also see TABLE 15 p. 821
- **Macrolides (clarithromycin)** are predicted to increase the exposure to gefitinib. **Moderate** Study
- **Macrolides (erythromycin)** are predicted to increase the exposure to gefitinib. **Moderate** Theoretical
- **Netupitant** is predicted to increase the exposure to gefitinib. **Moderate** Theoretical
- **Netupitant** is predicted to decrease the exposure to gefitinib. **Study** **Anecdotal**
- **Nevirapine** is predicted to decrease the exposure to gefitinib. **Moderate** Theoretical
- **Nilotinib** is predicted to increase the exposure to gefitinib. **Study** **Anecdotal** **Also see TABLE 15 p. 821
- **Gefitinib** is predicted to increase the risk of bleeding events when given with phenindione. **Severe** Theoretical
- **Proton pump inhibitors** are predicted to decrease the exposure to gefitinib. **Severe** Theoretical
- **Rifampicin** is predicted to decrease the exposure to gefitinib. **Avoid.** **Severe** Theoretical
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with gemcitabine. Public Health England advises avoid. **Severe** Theoretical
- **Gemfibrozil** are predicted to increase the anticoagulant effect of coumarins (warfarin). **Moderate** Study
- **Fosaprepitant** is predicted to decrease the exposure to gefitinib. **Study** **Severe** Theoretical

### Glucagon

- **Gastric ulcer** is predicted to decrease the exposure to gefitinib. **Study** **Anecdotal**

### Glucose

- **Gefitinib** is predicted to slightly decrease the exposure to gefitinib. **Moderate** Theoretical
Grapefruit juice is predicted to increase the exposure to bosutinib. Avoid. (Moderate) Theoretical
Grapefruit juice is predicted to increase the exposure to buspirone. Avoid. (Mild) Study
Grapefruit juice is predicted to increase the exposure to cabozantinib. Avoid. (Moderate) Theoretical
Grapefruit juice very slightly increases the exposure to calcium channel blockers (amlodipine). Avoid. (Mild) Study
Grapefruit juice increases the exposure to calcium channel blockers (felodipine). Avoid. (Moderate) Study
Grapefruit juice is predicted to increase the exposure to calcium channel blockers (lercanidipine). Avoid. (Moderate) Theoretical
Grapefruit juice increases the exposure to calcium channel blockers (nicardipine). Avoid. (Mild) Study
Grapefruit juice increases the exposure to oral corticosteroids (budesonide). Avoid. (Moderate) Study
Grapefruit juice is predicted to increase the exposure to ceritinib. Avoid. (Severe) Theoretical
Grapefruit juice increases the concentration of ciclosporin. Avoid. (Severe) Study
Grapefruit juice markedly decreases the exposure to clopidogrel. (Severe) Study
Grapefruit juice is predicted to increase the exposure to cobimetinib. Avoid. (Severe) Theoretical
Grapefruit juice moderately increases the exposure to oral corticosteroids (budesonide). Avoid. (Moderate) Study
Grapefruit juice is predicted to increase the exposure to crizotinib. Avoid. (Moderate) Theoretical
Grapefruit juice is predicted to increase the exposure to darifenacin. (Moderate) Study
Grapefruit juice is predicted to increase the exposure to dasatinib. Avoid. (Moderate) Theoretical
Grapefruit juice is predicted to increase the risk of ergotism when given with ergometrine. (Severe) Theoretical
Grapefruit juice is predicted to increase the exposure to ergotamine. (Severe) Theoretical
Grapefruit juice is predicted to increase the exposure to erlotinib. (Moderate) Theoretical
Grapefruit juice is predicted to increase the exposure to everolimus. Avoid. (Severe) Theoretical
Grapefruit juice is predicted to increase the exposure to ibritinib. Avoid. (Moderate) Theoretical
Grapefruit juice is predicted to increase the exposure to imatinib. (Moderate) Theoretical
Grapefruit juice is predicted to increase the exposure to ivabradine. Avoid. (Moderate) Study
Grapefruit juice is predicted to increase the exposure to ivacaftor. Avoid. (Moderate) Theoretical
Grapefruit juice is predicted to increase the exposure to lapatinib. Avoid. (Moderate) Theoretical
Grapefruit juice is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical
Grapefruit juice is predicted to increase the exposure to lurasidone. Avoid. (Severe) Theoretical
Grapefruit juice is predicted to increase the exposure to naloxegol. Avoid. (Moderate) Theoretical
Grapefruit juice is predicted to increase the exposure to nilotinib. Avoid. (Severe) Theoretical
Grapefruit juice is predicted to increase the exposure to olaparib. Avoid. (Moderate) Theoretical
Grapefruit juice is predicted to increase the exposure to palbociclib. Avoid. (Severe) Theoretical
Grapefruit juice is predicted to increase the exposure to pazopanib. Avoid. (Severe) Theoretical
Grapefruit juice is predicted to increase the exposure to phosphodiesterase type-5 inhibitors. Use with caution or avoid. (Moderate) Study
Grapefruit juice increases the exposure to pimozone. Avoid. (Severe) Theoretical
Grapefruit juice is predicted to increase the exposure to ponatinib. (Moderate) Theoretical
Grapefruit juice is predicted to increase the exposure to praziquantel. (Moderate) Study
Grapefruit juice is predicted to increase the exposure to quetiapine. Avoid. (Severe) Theoretical
Grapefruit juice is predicted to increase the concentration of ranolazine. Avoid. (Severe) Theoretical
Grapefruit juice is predicted to increase the exposure to regorafenib. Avoid. (Moderate) Theoretical
Grapefruit juice is predicted to increase the exposure to ruxolitinib. (Severe) Theoretical
Grapefruit juice is predicted to increase the exposure to saxagliptin. (Mild) Theoretical
Grapefruit juice increases the concentration of sirolimus. Avoid. (Moderate) Study
Grapefruit juice moderately increases the exposure to SSRIs (sertraline). Avoid. (Moderate) Study
Grapefruit juice increases the exposure to statins (atorvastatin). Avoid. (Mild) Study
Grapefruit juice increases the exposure to statins (simvastatin). Avoid. (Severe) Study
Grapefruit juice is predicted to increase the exposure to sunitinib. Avoid. (Moderate) Theoretical
Grapefruit juice is predicted to increase the exposure to sulindac. Avoid. (Severe) Study
Grapefruit juice is predicted to increase the exposure to ulipristal. Avoid. If used for uterine fibroids. (Moderate) Theoretical
Grapefruit juice is predicted to increase the exposure to venodilax. Avoid. (Severe) Theoretical
Grapefruit juice is predicted to increase the exposure to tizanidine. Avoid. (Severe) Study
Grapefruit juice is predicted to increase the exposure to tolcapone. Avoid. (Severe) Study
Grapefruit juice is predicted to increase the exposure to voriconazole (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) is predicted to increase the concentration of voriconazole. Use with caution or avoid. (Moderate) Theoretical
Grapefruit juice moderately increases the exposure to ticagrelor. (Moderate) Study
Grapefruit juice increases the exposure to tolvaptan. Avoid. (Moderate) Study
Grapefruit juice is predicted to increase the exposure to ulipristal. Avoid. If used for uterine fibroids. (Moderate) Theoretical
Grapefruit juice increases the exposure to venodilax. Avoid. (Severe) Theoretical
Grapefruit juice is predicted to increase the exposure to grazoprevir. Avoid. (Severe) Study
Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to grazoprevir. Avoid. (Severe) Study
Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately to markedly increase the exposure to grazoprevir. Avoid. (Mild) Study
Bosentan is predicted to markedly decrease the exposure to grazoprevir. Avoid. (Severe) Study
Ciclosporin greatly increases the exposure to grazoprevir. Avoid. (Severe) Study
Cobicistat is predicted to moderately to markedly increase the exposure to grazoprevir. Avoid. (Severe) Study
Efavirenz is predicted to markedly decrease the exposure to grazoprevir. Avoid. (Severe) Study
Enzalutamide is predicted to decrease the exposure to grazoprevir. Avoid. (Severe) Study
Etravirine is predicted to decrease the exposure to grazoprevir. Avoid. (Mild) Theoretical
HIV-1 protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to moderately to markedly increase the exposure to grazoprevir. Avoid. (Severe) Study
Idelalisib is predicted to moderately to markedly increase the exposure to grazoprevir. Avoid. (Severe) Study
Macrolides (clarithromycin) are predicted to moderately to markedly increase the exposure to grazoprevir. Avoid. (Severe) Study
Modafinil is predicted to decrease the exposure to grazoprevir. Avoid. (Unknown) Theoretical
Nevirapine is predicted to markedly decrease the exposure to grazoprevir. Avoid. (Severe) Study
Rifampicin is predicted to decrease the exposure to grazoprevir. Avoid. (Severe) Study
St John’s Wort is predicted to markedly decrease the exposure to grazoprevir. Avoid. (Severe) Study
Grazoprevir increases the exposure to statins (atorvastatin). Adjust atorvastatin dose, p. 128. (Moderate) Study
**Grazoprevir** (continued)

- **Grazoprevir** is predicted to increase the exposure to statins (fluvastatin). Adjust fluvastatin dose, p. 129. [Unknown] Theoretical
- **Grazoprevir** increases the exposure to statins (rosuvastatin). Adjust rosuvastatin dose, p. 130. [Moderate] Study
- **Grazoprevir** is predicted to increase the exposure to statins (simvastatin). Adjust simvastatin dose, p. 130. [Unknown] Theoretical
- **Grazoprevir** increases the exposure to tacrolimus. [Moderate] Study

**Griseofulvin**

**FOOD AND LIFESTYLE** Disulfiram-like reaction might occur on consumption of alcohol.

- **Antiepileptics (phenobarbital, primidone)** decrease the effects of griseofulvin. [Moderate] Study
- **Griseofulvin** potentially decreases the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Anecdotal
- **Griseofulvin** potentially decreases the anticoagulant effect of coumarins. [Moderate] Anecdotal
- **Griseofulvin** decreases the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Anecdotal
- **Griseofulvin** decreases the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Anecdotal
- **Griseofulvin** potentially decreases the efficacy of oral levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Anecdotal
- **Griseofulvin** potentially decreases the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Anecdotal
- **Griseofulvin** potentially decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Anecdotal

**Guanethidine** → see TABLE 8 p. 819 (hypotension)

- **Amfeptamines (dexamfeptamine)** decrease the effects of guanethidine. [Severe] Study
- **Benzperidol** is predicted to decrease the effects of guanethidine. [Moderate] Theoretical → Also see TABLE 8 p. 819
- **Droperidol** is predicted to decrease the effects of guanethidine. Monitor and adjust dose. [Moderate] Theoretical → Also see TABLE 8 p. 819
- **Haloperidol** is predicted to decrease the antihypertensive effects of guanethidine. Monitor and adjust dose. [Moderate] Theoretical → Also see TABLE 8 p. 819
- **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to decrease the antihypertensive effects of guanethidine. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 8 p. 819
- **Phenothiazines** are predicted to decrease the antihypertensive effects of guanethidine. [Moderate] Theoretical → Also see TABLE 8 p. 819
- **Guanethidine** is predicted to increase the effects of sympathomimetics, inotropic (dopamine). [Severe] Theoretical
- **Guanethidine** is predicted to increase the effects of sympathomimetics, vasoconstrictor (adrenaline, epinephrine, noradrenaline, norepinephrine). [Moderate] Study
- **Guanethidine** increases the effects of sympathomimetics, vasoconstrictor (metaraminol). [Severe] Anecdotal
- **Guanethidine** increases the effects of sympathomimetics, vasoconstrictor (phenylephrine). [Severe] Study
- **Tricyclic antidepressants** are predicted to decrease the antihypertensive effects of guanethidine. [Moderate] Study → Also see TABLE 8 p. 819

**Guanfacine** → see TABLE 8 p. 819 (hypotension), TABLE 11 p. 820 (CNS depressant effects)

- **Antihypertensives (dronedarone)** are predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 222. [Moderate] Theoretical
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the concentration of guanfacine. Adjust guanfacine dose, p. 222. [Moderate] Study → Also see TABLE 11 p. 820
- **Antiepileptics (oxcarbazepine)** are predicted to decrease the concentration of guanfacine. Monitor and adjust guanfacine dose, p. 222. [Moderate] Theoretical
- **Guanfacine** increases the concentration of antiepileptics (valproate). Monitor and adjust dose. [Moderate] Study
- **Antifungals, azoles (fluconazole, itraconazole, ketoconazole)** are predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 222. [Moderate] Theoretical
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to guanfacine. Adjust guanfacine dose, p. 222. [Moderate] Study
- **Aprepitant** is predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 222. [Moderate] Theoretical
- **Bosentan** is predicted to decrease the concentration of guanfacine. Adjust dose. [Moderate] Theoretical
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 222. [Moderate] Theoretical → Also see TABLE 8 p. 819
- **Cobicistat** is predicted to increase the exposure to guanfacine. Adjust guanfacine dose, p. 222. [Moderate] Study
- **Crizotinib** is predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 222. [Moderate] Theoretical
- **Elavirez** is predicted to decrease the concentration of guanfacine. Adjust dose. [Moderate] Theoretical
- **Enzalutamide** is predicted to decrease the concentration of guanfacine. Adjust guanfacine dose, p. 222. [Moderate] Study
- **Fosaprepitant** is predicted to increase the concentration of guanfacine. [Moderate] Theoretical
- **HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to increase the exposure to guanfacine. Adjust guanfacine dose, p. 222. [Moderate] Study
- **HIV-protease inhibitors (indinavir)** are predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 222. [Moderate] Theoretical
- **Macrolides (clarithromycin)** are predicted to increase the exposure to guanfacine. Adjust guanfacine dose, p. 222. [Moderate] Study
- **Macrolides (erythromycin)** are predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 222. [Moderate] Theoretical
- **Netupitant** is predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 222. [Moderate] Theoretical
- **Nevirapine** is predicted to decrease the concentration of guanfacine. Adjust dose. [Moderate] Theoretical
- **Nilotinib** is predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 222. [Moderate] Theoretical
- **Rifampicin** is predicted to decrease the concentration of guanfacine. Adjust guanfacine dose, p. 222. [Moderate] Study
- **St John’s Wort** is predicted to decrease the concentration of guanfacine. Adjust dose. [Moderate] Theoretical

**H2 receptor antagonists**

- Cimetidine - famotidine - nizatidine - ranitidine
- Cimetidine decreases the clearance of abendazole. [Moderate] Study
- Cimetidine increases the concentration of aminophylline. Adjust dose. [Severe] Study
- Cimetidine slightly increases the exposure to atenolol. [Moderate] Study
- Cimetidine increases the exposure to antihypertensives (amiodarone). [Moderate] Study
- Cimetidine slightly increases the exposure to antiarrhythmics (amiodarone). Avoid. [Moderate] Study
- Cimetidine increases the exposure to antiarrhythmics (amiodarone). [Moderate] Study
- Cimetidine increases the exposure to antiarrhythmics (amiodarone). [Moderate] Study
- Cimetidine transiently increases the concentration of antiepileptics (carbamazepine). [Moderate] Study
Cimetidine increases the concentration of antiepileptics (fosphenytoin). Monitor phenytoin concentration and adjust dose. [Severe] Study

Cimetidine increases the concentration of antiepileptics (phenytoin). Monitor phenytoin concentration and adjust dose. [Severe] Study

H₂ receptor antagonists are predicted to decrease the absorption of antifungals, azoles (itraconazole). Administer itraconazole capsules with an acidic beverage. [Moderate] Study

H₂ receptor antagonists are predicted to decrease the absorption of antifungals, azoles (ketoconazole). Administer ketoconazole with an acidic beverage. [Moderate] Study

H₂ receptor antagonists are predicted to slightly decrease the exposure to antifungals, azoles (posaconazole). Avoid use of posaconazole oral suspension. [Moderate] Study

Cimetidine decreases the clearance of antimalarials (chloroquine). [Moderate] Study

Cimetidine slightly increases the exposure to antimalarials (quinine). [Moderate] Study

H₂ receptor antagonists are predicted to decrease the absorption of bosutinib. [Moderate] Theoretical

Cimetidine slightly increases the exposure to calcium channel blockers (diltiazem, isradipine, nimodipine). Monitor and adjust dose. [Moderate] Study

Cimetidine (high-dose) is predicted to increase the exposure to calcium channel blockers (lercanidipine). [Moderate] Theoretical

Cimetidine moderately increases the exposure to calcium channel blockers (nimodipine). Monitor and adjust dose. [Severe] Study

Cimetidine increases the exposure to calcium channel blockers (verapamil). [Moderate] Study

Cimetidine is predicted to slightly increase the exposure to capcetibatine. [Severe] Theoretical

H₂ receptor antagonists are predicted to decrease the absorption of certitinib. [Moderate] Theoretical

Cimetidine increases the concentration of ciclosporin. [Mild] Study

Cimetidine increases the anticoagulant effect of coumarins. [Severe] Study

H₂ receptor antagonists are predicted to decrease the exposure to dabrafenib. Avoid. [Severe] Theoretical

H₂ receptor antagonists are predicted to decrease the exposure to erlotinib. Erlotinib should be taken 2 hours before or 10 hours after H₂ receptor antagonists. [Moderate] Study

H₂ receptor antagonists are predicted to decrease the absorption of dipyrindamole (immediate release tablets). [Moderate] Theoretical

Cimetidine slightly increases the exposure to dopamine receptor agonists (pramipexole). Adjust dose. [Moderate] Study

H₂ receptor antagonists are predicted to decrease the exposure to erlotinib. Erlotinib should be taken 2 hours before or 10 hours after H₂ receptor antagonists. [Moderate] Study

Cimetidine increases the concentration of fampridine. Avoid. [Severe] Theoretical

Cimetidine slightly increases the exposure to fluoroouracil. [Severe] Study

H₂ receptor antagonists are predicted to slightly to moderately decrease the exposure to gefitinib. [Moderate] Study

H₂ receptor antagonists are predicted to decrease the effects of histamine. Avoid. [Severe] Theoretical

H₂ receptor antagonists decrease the exposure to HIV-protease inhibitors (atazanavir). Monitor and adjust dose. [Moderate] Study

Cimetidine is predicted to decrease the clearance of hydroxychloroquine. [Moderate] Theoretical

H₂ receptor antagonists are predicted to decrease the exposure to ledipasvir. Adjust dose, see sofosbuvir with ledipasvir. [Moderate] Study

H₂ receptor antagonists (cimetidine, ranitidine) are predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical

Lumacaftor is predicted to affect the exposure to ranitidine. Monitor and adjust dose. [Moderate] Theoretical

Cimetidine slightly increases the exposure to macrolides (erythromycin). [Moderate] Study

Cimetidine increases the concentration of mebendazole. [Moderate] Study

Cimetidine slightly increases the exposure to metformin. Monitor and adjust dose. [Moderate] Study

Cimetidine slightly increases the exposure to mirtazapine. Use with caution and adjust dose. [Moderate] Theoretical

Cimetidine increases the exposure to moclubemide. Adjust moclubemide dose. [Mild] Study

H₂ receptor antagonists are predicted to decrease the absorption of nilotinib. H₂ receptor antagonists should be taken 10 hours before or 2 hours after nilotinib. [Mild] Theoretical

Cimetidine increases the concentration of opioids (alfentanil). Use with caution and adjust dose. [Severe] Study

Cimetidine increases the exposure to opioids (fentanyl). [Moderate] Study

H₂ receptor antagonists are predicted to decrease the exposure to pazopanib. H₂ receptor antagonists should be taken 10 hours before or 2 hours after pazopanib. [Moderate] Theoretical

Cimetidine increases the exposure to phenindione. [Severe] Anecdotal

Cimetidine moderately increases the exposure to praziquantel. [Moderate] Study

H₂ receptor antagonists are predicted to decrease the exposure to rilpivirine. H₂ receptor antagonists should be taken 12 hours before or 4 hours after rilpivirine. [Severe] Study

Cimetidine slightly increases the exposure to roflumilast. [Moderate] Study

H₂ receptor antagonists potentially decrease the exposure to sofosbuvir. Adjust dose, see sofosbuvir with ledipasvir and sofosbuvir with velpatavir. [Moderate] Study

Cimetidine slightly increases the exposure to SSRIs (citalopram, escitalopram). Adjust dose. [Moderate] Study

Cimetidine slightly increases the exposure to SSRIs (paroxetine, sertraline). [Moderate] Study

Cimetidine is predicted to increase the risk of toxicity when given with tegafur. [Severe] Theoretical

Cimetidine increases the concentration of theophylline. Adjust dose. [Severe] Study

Cimetidine increases the exposure to tricyclic antidepressants. [Moderate] Study

H₂ receptor antagonists are predicted to decrease the concentration of velpatavir. Adjust dose, see sofosbuvir with velpatavir. [Moderate] Study

Cimetidine slightly increases the exposure to venlafaxine. [Mild] Study

Cimetidine slightly increases the exposure to zolmitriptan. Adjust zolmitriptan dose, p. 280. [Mild] Study

*Haloperidol → see TABLE 8 p. 819 (hypotension), TABLE 9 p. 820 (QT-interval prolongation), TABLE 11 p. 820 (CNS depressant effects), TABLE 10 p. 820 (antimuscarinics)*

**FOOD AND LIFESTYLE** Dose adjustment might be necessary if smoking started or stopped during treatment.

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the concentration of haloperidol. Adjust dose. [Moderate] Study → Also see TABLE 11 p. 820

- Haloperidol potentially increases the risk of overheating and dehydration when given with antiepileptics (zonisamide). Avoid in children. [Severe] Theoretical

- Antifungals, azoles (itraconazole) increase the concentration of haloperidol. [Moderate] Study

- Haloperidol is predicted to increase the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 819 → Also see TABLE 9 p. 820 → Also see TABLE 10 p. 820

- Enzalutamide decreases the concentration of haloperidol. Adjust dose. [Moderate] Study

- Haloperidol is predicted to decrease the effects of guanethidine. Monitor and adjust dose. [Moderate] Theoretical → Also see TABLE 8 p. 819

- HIV-protease inhibitors (ritonavir) are predicted to increase the exposure to haloperidol. [Severe] Theoretical

- Haloperidol decreases the effects of levodopa. [Severe] Study → Also see TABLE 8 p. 819

- Rifampicin decreases the concentration of haloperidol. Adjust dose. [Moderate] Study
Haloperidol (continued)

- Haloperidol potentially decreases the effects of sodium phenytoin. [Moderate] Anecdotal
- SSRI (fluoxetine) increase the concentration of haloperidol. Adjust dose. [Moderate] Anecdotal
- SSRI (fluvoxamine) increase the concentration of haloperidol. Adjust dose. [Moderate] Study
- Venlafaxine slightly increases the exposure to haloperidol. [Severe] Study → Also see TABLE 9 p. 820 → Also see TABLE 11 p. 820

Heparin (unfractionated) → see TABLE 16 p. 822 (increased serum potassium), TABLE 3 p. 818 (anticoagulant effects)
- Ranibizumab increases the risk of bleeding events when given with heparin (unfractionated). [Severe] Theoretical

Histamine → see TABLE 8 p. 819 (hypotension)
- Antihistamines, non-sedating are predicted to decrease the effects of histamine. Avoid. [Severe] Theoretical
- Antihistamines, sedating are predicted to decrease the effects of histamine. Avoid. [Severe] Theoretical
- Clonidine is predicted to decrease the effects of histamine. Avoid. [Severe] Theoretical → Also see TABLE 8 p. 819
- Clobazam is predicted to decrease the effects of histamine. Avoid. [Severe] Theoretical
- Corticosteroids are predicted to decrease the effects of histamine. Avoid. [Severe] Theoretical
- H2 receptor antagonists are predicted to decrease the effects of histamine. Avoid. [Severe] Theoretical
- Monoamine-oxidase A and B inhibitors, irreversible are predicted to affect the exposure to histamine. Avoid. [Severe] Theoretical → Also see TABLE 8 p. 819
- Olanzapine is predicted to decrease the effects of histamine. Avoid. [Severe] Theoretical → Also see TABLE 8 p. 819
- Phenothiazines are predicted to decrease the effects of histamine. Avoid. [Severe] Theoretical → Also see TABLE 8 p. 819
- Quetiapine is predicted to decrease the effects of histamine. Avoid. [Severe] Theoretical → Also see TABLE 8 p. 819
- Risperidone is predicted to decrease the effects of histamine. Avoid. [Severe] Theoretical → Also see TABLE 8 p. 819
- Tricyclic antidepressants are predicted to decrease the effects of histamine. Avoid. [Severe] Theoretical → Also see TABLE 8 p. 819

HIV-protease inhibitors → see TABLE 9 p. 820 (QT-interval prolongation)
- Caution on concurrent use of atazanavir, lopinavir - ritonavir, saquinavir - tipranavir

- Tipranavir slightly decreases the exposure to abacavir. Avoid. [Severe] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprénavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to abiraterone. [Severe] Theoretical
- HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the exposure to atazanavir. [Severe] Theoretical
- Ritonavir is predicted to decrease the exposure to agomelatine. [Moderate] Theoretical
- Ritonavir decreases the exposure to albendazole. [Moderate] Study
- Indinavir is predicted to increase the exposure to aldosterone antagonists (eplerenone). Adjust eplerenone dose. [Severe] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprénavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to markedly increase the exposure to aldosterone antagonists (eplerenone). Avoid. [Severe] Study
- HIV-protease inhibitors (ritonavir, saquinavir) are predicted to increase the exposure to aliskiren. [Moderate] Theoretical
- HIV-protease inhibitors (atazanavir, darunavir, fosamprénavir, lopinavir, ritonavir, saquinavir, tipranavir) increase the exposure to almitrin. [Mild] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprénavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to moderately increase the exposure to alpha blockers (alfuzosin, tamsulosin). Use with caution or avoid. [Moderate] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprénavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to alpha blockers (doxazosin). [Moderate] Study
- Indinavir is predicted to increase the exposure to alpha blockers. [Severe] Study
- HIV-protease inhibitors (ritonavir, tipranavir) are predicted to increase the exposure to amifamidine. [Severe] Theoretical
- Ritonavir decreases the exposure to aminophylline. Adjust dose. [Moderate] Study
- Antacids are predicted to decrease the absorption of atazanavir. Atazanavir should be taken 2 hours before or 1 hour after antacids. [Severe] Theoretical
- Antacids are predicted to decrease the absorption of tipranavir. Separate administration by 2 hours. [Moderate] Study
- HIV-protease inhibitors are predicted to increase the exposure to antiarhythms (amiodarone). Avoid. [Severe] Theoretical → Also see TABLE 9 p. 820
- HIV-protease inhibitors are predicted to increase the exposure to antiarhythms (disopyramide). [Severe] Theoretical → Also see TABLE 9 p. 820
- HIV-protease inhibitors (atazanavir, darunavir, fosamprénavir, lopinavir, ritonavir, saquinavir, tipranavir) very markedly increase the exposure to antiarhythms (dronedarone). Avoid. [Severe] Study → Also see TABLE 9 p. 820
- Ritonavir is predicted to increase the exposure to antiarhythms (flecainide). [Severe] Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to antiarhythms (propafenone). Monitor and adjust dose. [Moderate] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprénavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to antiarhythms (propafenone). Monitor and adjust dose. [Severe] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprénavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to antichoLinesterase, centrally acting (galantamine). Monitor and adjust dose. [Moderate] Study
- HIV-protease inhibitors are predicted to increase the exposure to antiepileptics (carbamazepine) and antiepileptics (carbamazepine) are predicted to decrease the exposure to HIV-protease inhibitors. Monitor and adjust dose. [Severe] Theoretical
- HIV-protease inhibitors are predicted to affect the exposure to antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) decrease the concentration of HIV-protease inhibitors. [Severe] Theoretical
- Ritonavir slightly decreases the exposure to antiepileptics (lamotrigine). [Severe] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprénavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to slightly increase the exposure to antiepileptics (perampanel). [Mild] Study
- HIV-protease inhibitors are predicted to affect the concentration of antiepileptics (phenobarbital, primidone) and antiepileptics (phenobarbital, primidone) are predicted to decrease the concentration of HIV-protease inhibitors. [Severe] Theoretical
Ritonavir is predicted to decrease the concentration of antiepileptics (valproate). Severe Anecdotal
Antifungals, azoles (fluconazole) slightly increase the exposure to tipranavir. Avoid or adjust dose. (Moderate) Study
Antifungals, azoles (miconazole) are predicted to increase the concentration of HIV-protease inhibitors. Use with caution and adjust dose. (Moderate) Theoretical
Antifungals, azoles (posaconazole) are predicted to increase the exposure to HIV-protease inhibitors. (Moderate) Study
HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase exposure to antifungals, azoles (isavuconazole). Avoid or monitor side effects. (Severe) Study
HIV-protease inhibitors are predicted to increase the exposure to antifungals, azoles (itraconazole). Use with caution and adjust dose. (Severe) Study
HIV-protease inhibitors are predicted to increase the exposure to antifungals, azoles (ketoconazole). Use with caution and adjust dose. (Moderate) Study
HIV-protease inhibitors are predicted to affect the exposure to antifungals, azoles (voriconazole) and antifungals, azoles (voriconazole) potentially affect the exposure to HIV-protease inhibitors. (Severe) Study → Also see Table 9 p. 820
Indinavir is predicted to increase the exposure to antihistamines, non-sedating (mizolastine). (Severe) Theoretical
HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase exposure to antihistamines, non-sedating (mizolastine). Avoid. (Severe) Study
HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase exposure to antimalarials (artemether) with lumefantrine. (Moderate) Study → Also see Table 9 p. 820
HIV-protease inhibitors decrease the exposure to antimalarials (atovaquone). Avoid if boosted with ritonavir. (Moderate) Study
HIV-protease inhibitors are predicted to increase the concentration of antimalarials (piperazine). (Severe) Theoretical
HIV-protease inhibitors are predicted to decrease the exposure to antimalarials (proguanil). Avoid. (Moderate) Study
HIV-protease inhibitors are predicted to affect the exposure to antimalarials (quinine). (Severe) Study → Also see Table 9 p. 820
Ritonavir is predicted to increase the exposure to apixaban. Avoid. (Severe) Theoretical
HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to markedly increase the exposure to aprepitant. (Moderate) Study
HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to slightly increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 240. (Moderate) Study
HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to axitinib. Avoid or adjust dose. (Moderate) Study
Indinavir is predicted to increase the exposure to axitinib. (Moderate) Theoretical
HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to bedaquiline. Avoid prolonged use. (Mild) Study → Also see Table 9 p. 820
Indinavir is predicted to increase the exposure to bedaquiline. Avoid prolonged use. (Mild) Theoretical
Ritonavir is predicted to increase the exposure to beta blockers, non-selective (carvedilol). (Moderate) Theoretical
HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the exposure to beta blockers, non-selective (nadolol). (Moderate) Study
Ritonavir (high-dose) is predicted to increase the exposure to beta blockers, non-selective (timolol). (Moderate) Theoretical
Ritonavir is predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). (Moderate) Study
HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to beta, agonists (salmeterol). Avoid. (Severe) Study
HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) slightly increase the exposure to bortezomib. (Moderate) Study
HIV-protease inhibitors are predicted to increase the exposure to bosentan. (Severe) Study
HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to markedly increase the exposure to bosutinib. Avoid or adjust bosutinib dose. (Severe) Study → Also see Table 9 p. 820
Indinavir is predicted to increase the exposure to bosutinib. Avoid or adjust bosutinib dose. (Severe) Theoretical
Ritonavir slightly to moderately decreases the exposure to bupropion. (Moderate) Study
HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to buspirone. Adjust buspirone dose. (Severe) Study
Indinavir is predicted to increase the exposure to buspirone. Use with caution and adjust dose. (Moderate) Study
HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) slightly increase the exposure to cabozaatinib. (Moderate) Theoretical
Ritonavir is predicted to moderately increase the clearance of caffeine citrate. Monitor and adjust dose. (Moderate) Study
HIV-protease inhibitors are predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. (Moderate) Study
HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). (Severe) Study
HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to markedly increase the exposure to calcium channel blockers (lercanidipine). Avoid. (Severe) Study
HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to cannabis extract. Use with caution and adjust dose. (Moderate) Theoretical
HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to ceritinib. Avoid or adjust ceritinib dose. (Severe) Study → Also see Table 9 p. 820
Indinavir is predicted to increase the exposure to ceritinib. (Moderate) Theoretical
HIV-protease inhibitors increase the concentration of ciclosporin. (Severe) Study
HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to moderately increase the exposure to cilostazol. Adjust cilostazol dose. (Moderate) Study
HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to cinacalcet. Adjust dose. (Moderate) Study
Ritonavir is predicted to increase the exposure to clozapine. Avoid. (Severe) Theoretical
HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to markedly increase the exposure to cobimetinib. Avoid or monitor for toxicity. (Severe) Study
Indinavir is predicted to increase the exposure to cobimetinib. (Severe) Theoretical
HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to colchicine. Avoid or adjust colchicine dose. (Severe) Study
Indinavir is predicted to increase the exposure to colchicine. Adjust colchicine dose. (Severe) Study
Atazanavir (unboosted) increases the exposure to combined hormonal contraceptives. Adjust dose. (Severe) Study
HIV-protease inhibitors (continued)

- **Ritonavir** is predicted to decrease the efficacy of **combined hormonal contraceptives**. For FSRH guidance, see Contraceptives, interactions p. 474. **Severe** Study
- **Ritonavir** is predicted to increase the concentration of corticosteroids (betamethasone, dexamethasone, deflazacort, hydrocortisone, methylprednisolone, prednisolone, triamcinolone). MHRA advises avoid or monitor beclometasone side effects. **Moderate** Theoretical
- **Ritonavir** is predicted to increase the predicted to increase the exposure to corticosteroids (betamethasone, dexamethasone, deflazacort, hydrocortisone, methylprednisolone, prednisolone, triamcinolone). MHRA advises avoid or monitor beclometasone as an alternative. **Severe** Study
- **HIV-protease inhibitors** (atazanavir, darunavir, fosamprenavir, lopinavir, saquinavir, tipranavir) are predicted to increase the exposure to corticosteroids (budesonide). **Avoid.** **Severe** Study
- **HIV-protease inhibitors** (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to corticosteroids (ciclesonide). **Avoid.** **Moderate** Theoretical
- **HIV-protease inhibitors** (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to corticosteroids (mometasone). **Monitor and adjust dose.** **Moderate** Study
- **HIV-protease inhibitors** (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to inhaled corticosteroids (fluticasone). **Severe** Study
- **Indinavir** is predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. **Moderate** Study
- **HIV-protease inhibitors** (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to corticosteroids (mometasone). **Moderate** Theoretical
- **HIV-protease inhibitors** (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to moderately increase the exposure to **crizotinib**. **Avoid.** **Moderate** Study
- **Indinavir** is predicted to increase the exposure to **crizotinib**. **Moderate** Theoretical
- **HIV-protease inhibitors** (lopinavir, ritonavir, saquinavir) are predicted to increase the exposure to **dabigatran**. **Avoid.** **Severe** Study
- **HIV-protease inhibitors** (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to **dabrafenib**. Use with caution or avoid. **(Moderate) Study**
- **HIV-protease inhibitors** (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to **dalatavir**. Adjust dalatavir dose. **(Moderate) Study**
- **HIV-protease inhibitors** (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to moderately increase the exposure to **daclatasvir**. **Adjust daclatasvir dose.** **(Moderate) Study**
- **Indinavir** is predicted to increase the exposure to **daclatasvir**. Adjust dose. **(Severe) Study**
- **HIV-protease inhibitors** (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to markedly increase the exposure to **darifenacin**. **Avoid.** **Severe** Study
- **Indinavir** is predicted to slightly increase the exposure to **darifenacin. **(Moderate) Study**
- **HIV-protease inhibitors** (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to **dasatinib**. Use with caution or avoid. **(Moderate) Study**
- **Indinavir** is predicted to increase the exposure to **dasatinib.** **(Moderate) Study**
- **HIV-protease inhibitors** (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) very slightly increase the exposure to delamanid. **Severe** Study → Also see **TABLE 9** p. 820
- **Ritonavir** is predicted to decrease the efficacy of **desogestrel**. For FSRH guidance, see Contraceptives, interactions p. 474. **Severe** Theoretical
- **Ritonavir** is predicted to increase the exposure to **diazepam**. **Avoid.** **Moderate** Theoretical
- **Didanosine** (buffered) decreases the exposure to **atazanavir**. **Monitor and adjust dose.** **Severe** Study
- **Didanosine** (buffered) is predicted to decrease the exposure to **darunavir** (boosted with ritonavir). **Didanosine** should be taken 2 hours after **atazanavir**. **(Severe) Study**
- **Didanosine** (buffered) is predicted to decrease the exposure to **efavirenz**. **Avoid if resistant to HIV-integrase inhibitors.** **Severe** Study
- **Tipranavir** moderately decreases the exposure to **dolutegravir**. **Refer to specialist literature.** **(Severe) Study**
- **HIV-protease inhibitors** increase the risk of QT-prolongation when given with **dopemideone**. **Avoid.** **Severe** Study
- **Indinavir** is predicted to increase the exposure to **dopamine receptor agonists** (bromocriptine, cabergoline). **Severe** Theoretical
- **HIV-protease inhibitors** (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) increase the exposure to dopamine receptor agonists (bromocriptine, cabergoline). **Severe** Study
- **HIV-protease inhibitors** (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to **dutasteride**. Monitor side effects and adjust dose. **(Moderate) Study**
- **Indinavir** is predicted to moderately increase the exposure to **dutasteride. **(Mild) Severe** Study
- **HIV-protease inhibitors** (lopinavir, ritonavir, saquinavir) are predicted to slightly increase the exposure to **edoxaban. **Severe** Study
- **Efavirenz** decreases the exposure to HIV-protease inhibitors. **Refer to specialist literature.** **Severe** Study
- **HIV-protease inhibitors** (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) slightly to moderately increase the exposure to **elvitra**. **Avoid.** **Moderate** Study
- **HIV-protease inhibitors** (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to markedly increase the exposure to **erepitan.** **Avoid.** **Severe** Study
- **Atazanavir** increases the concentration of **elvitra**. Refer to specialist literature. **Moderate** Study
- **Lopinavir** increases the concentration of **elvitra**. Refer to specialist literature. **Moderate** Study
- **HIV-protease inhibitors** (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the risk of ergotism when given with **ergometrine**. **Avoid.** **(Severe) Theoretical**
- **Indinavir** is predicted to increase the risk of ergotism when given with **ergometrine**. **(Severe) Theoretical**
- **HIV-protease inhibitors** (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the risk of ergotism when given with **ergotamine**. **Avoid.** **(Severe) Theoretical**
- **Indinavir** is predicted to increase the risk of ergotism when given with **ergotamine. **(Severe) Theoretical**
- **HIV-protease inhibitors** (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to slightly increase the exposure to **erlotinib.** **Use with caution and adjust dose.** **(Moderate) Study**
- **Indinavir** is predicted to increase the exposure to **erlotinib. **(Moderate) Theoretical

---

**TABLE 9** p. 820

BNFC 2017–2018
- **Ritonavir** is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 474.
  - [Severe] Theoretical

- **Etravirine** increases the exposure to fosamprenavir (boosted with ritonavir). Refer to specialist literature. [Moderate] Study

- **Etravirine** is predicted to decrease the exposure to indinavir. Avoid. [Severe] Theoretical

- **Tipranavir** decreases the exposure to etravirine. Avoid. [Severe] Study

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the concentration of everolimus. Avoid. [Severe] Study

- **Indinavir** is predicted to increase the exposure to saquinavir. Avoid. [Moderate] Study

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to moderately to markedly increase the exposure to fosoterodine. Adjust fosoterodine dose; avoid in hepatic and renal impairment. [Severe] Study

- **Indinavir** is predicted to increase the exposure to fosoterodine. Adjust fosoterodine dose in hepatic and renal impairment. [Mild] Study

- HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the exposure to fidaromycin. Avoid. [Moderate] Study

- **Ritonavir** is predicted to increase the exposure to fluvarazepam. Avoid. [Moderate] Theoretical

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to fosaprepitant. [Moderate] Theoretical

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to gefitinib. [Moderate] Study

- **Indinavir** is predicted to increase the exposure to gefitinib. [Moderate] Theoretical

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to grazeoprevir. Avoid. [Severe] Study

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to guanfacine. Adjust guanfacine dose, p. 222. [Moderate] Theoretical

- **Indinavir** is predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 222. [Moderate] Theoretical

- **H₂ receptor antagonists** decrease the exposure to atazanavir. Monitor and adjust dose. [Moderate] Study

- **Ritonavir** is predicted to increase the exposure to haloperidol. [Severe] Theoretical

- **Ritonavir** is predicted to decrease the effects of hormone replacement therapy. [Moderate] Anecdotal

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to very markedly increase the exposure to ibritunib. Avoid or adjust ibritunib dose. [Severe] Study

- **Indinavir** is predicted to increase the exposure to ibritunib. Avoid or adjust ibritunib dose. [Severe] Theoretical

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to imatinib. [Moderate] Study

- Etravirine is predicted to increase the exposure to irinotecan when given with irinotecan. Avoid. [Moderate] Study

- **Indinavir** increases the exposure to irinotecan. Adjust dose. [Severe] Study

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to irinotecan. Avoid. [Moderate] Study

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to ivabradine. Avoid. [Severe] Study

- **Indinavir** is predicted to increase the exposure to ivabradine. Adjust dose. [Severe] Study

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to ivabradine. Avoid. [Severe] Theoretical

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to markedly increase the exposure to lapatinib. Avoid. [Severe] Study

- **Indinavir** is predicted to increase the exposure to lapatinib. [Severe] Theoretical

- **Ritonavir** is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to markedly increase the exposure to lomitapide. Avoid. [Severe] Study

- **Indinavir** is predicted to increase the exposure to lomitapide. Avoid. [Moderate] Theoretical

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to lurasidone. Avoid. [Severe] Study

- **Indinavir** is predicted to increase the exposure to lurasidone. [Moderate] Study

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to macitentan. [Moderate] Study

- **Macrolides** (clarithromycin) increase the exposure to saquinavir and saquinavir increases the exposure to macrolides (clarithromycin). Avoid. [Severe] Study

- Macrolides (erythromycin) are predicted to increase the exposure to saquinavir. Avoid. [Severe] Theoretical

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to macrolides (clarithromycin). Monitor renal function and adjust dose. [Severe] Study

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to macrolides (erythromycin). [Severe] Theoretical

- **Maraviroc** potentially decreases the exposure to fosamprenavir and fosamprenavir potentially decreases the exposure to maraviroc. Avoid. [Severe] Study

- HIV-protease inhibitors (atazanavir, darunavir, lopinavir, ritonavir, saquinavir) increase the exposure to maraviroc. Refer to specialist literature. [Severe] Study

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to markedly to very markedly increase the exposure to midazolam. Avoid or adjust midazolam dose. [Severe] Study

- **Indinavir** is predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. [Severe] Study

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to markedly increase the exposure to mirabegron. Adjust mirabegron dose in hepatic and renal impairment. [Moderate] Study

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to mirtazapine. [Moderate] Study

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to modafinil. [Mild] Theoretical

- HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the risk of neutropenia when given with monoclonal antibodies (brentuximab vedotin). Monitor and adjust dose. [Severe] Study

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to monoclonal antibodies (trastuzumab emtansine). Avoid. [Severe] Theoretical

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to markedly increase the exposure to naloxegol. Avoid. [Severe] Study
HIV-protease inhibitors (continued)

- **Indinavir** is predicted to increase the exposure to **nafinexol**. Adjust **nafinexol** dose and monitor side effects. [Moderate] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to **netupitant**. [Mild] Study
- **Nevirapine** decreases the exposure to HIV-protease inhibitors. Refer to specialist literature. [Moderate] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to moderately increase the exposure to **nilotinib**. Avoid. [Severe] Study → Also see TABLE 9 p. 820
- HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the exposure to **nintedanib**. [Moderate] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to **nitisinone**. Adjust **nitisinone** dose. [Moderate] Theoretical
- **Ritonavir** is predicted to decrease the efficacy of **nortriptyline**. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Anecdotal
- Ritonavir moderately decreases the exposure to **olanzapine**. [Moderate] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to **olaparib**. Avoid or adjust **olaparib** dose. [Moderate] Study
- **Indinavir** is predicted to increase the exposure to olaparib. Avoid or adjust **olaparib** dose. [Moderate] Theoretical
- **Indinavir** is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. [Moderate] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone, sufentanil). Monitor and adjust dose. [Severe] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to opioids (methadone). [Moderate] Theoretical → Also see TABLE 9 p. 820
- **Indinavir** is predicted to increase the concentration of opioids (morphine). [Moderate] Theoretical
- Ritonavir is predicted to increase the concentration of opioids (morphine). [Moderate] Theoretical
- **Ritonavir** increases the risk of CNS toxicity when given with opioids (pethidine). Avoid. [Severe] Study
- **Ritonavir** is predicted to decrease the efficacy of opioids (tramadol). [Moderate] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to **oxybutynin**. [Mild] Study
- **Indinavir** is predicted to increase the exposure to oxybutynin. [Mild] Theoretical
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to palbociclib. Avoid or adjust palbociclib dose. [Severe] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to **panobinostat**. Adjust **panobinostat** dose; in hepatic impairment avoid. [Moderate] Study → Also see TABLE 9 p. 820
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. [Severe] Theoretical
- **Indinavir** potentially increases the exposure to paritaprevir. Avoid. [Severe] Theoretical
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to **pazopanib**. Avoid or adjust pazopanib dose. [Moderate] Study → Also see TABLE 9 p. 820
- **Indinavir** is predicted to increase the exposure to **pazopanib**. [Moderate] Theoretical
- **Indinavir** is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil). Adjust **avanafil** dose. [Moderate] Theoretical
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil, vardenafil). Avoid. [Severe] Study → Also see TABLE 9 p. 820
- **Indinavir** is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Monitor and adjust **sildenafil** dose, p. 117. [Moderate] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Avoid or adjust **sildenafil** dose, p. 117. [Severe] Study → Also see TABLE 9 p. 820
- **Indinavir** is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). Avoid or adjust **tadalafil** dose. [Moderate] Theoretical
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). Use with caution or avoid. [Severe] Study
- **Indinavir** is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (vardenafil). Adjust dose. [Severe] Theoretical
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to **pimozide**. Avoid. [Severe] Study → Also see TABLE 9 p. 820
- **Indinavir** is predicted to increase the exposure to pitolisant. Use with caution and adjust dose. [Moderate] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to slightly increase the exposure to **ponatinib**. Monitor and adjust **ponatinib** dose. [Moderate] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to moderately increase the exposure to **proziquantel**. [Mild] Study
- **Proton pump inhibitors** decrease the exposure to atazanavir. Avoid or adjust dose. [Severe] Study
- **Proton pump inhibitors** decrease the exposure to saquinavir. Avoid. [Severe] Study
- **Proton pump inhibitors** decrease the exposure to tipranavir. Avoid. [Severe] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to **quetiapine**. Avoid. [Severe] Study
- **Indinavir** is predicted to increase the exposure to quetiapine. Avoid. [Mild] Study
- Darunavir increases the risk of rash when given with **raltegravir**. [Moderate] Study
- **Fosamprenavir** (boosted with ritonavir) decreases the exposure to raltegravir and **raltegravir** decreases the exposure to fosamprenavir (boosted with ritonavir). Avoid. [Severe] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to **ranolazine**. Avoid. [Severe] Study → Also see TABLE 9 p. 820
- **Indinavir** is predicted to increase the exposure to **ranolazine**. [Severe] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to reboxetine. Avoid. [Moderate] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to **regorafenib**. Avoid. [Moderate] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to **repaglinide**. [Moderate] Study
HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to retinoids (alitretinoin). Adjust alitretinoin dose. [Moderate] Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to rifabutin. Monitor and adjust dose. [Severe] Study

Indinavir increases the exposure to rifabutin and rifabutin decreases the exposure to indinavir. Avoid. [Severe] Study

Ritonavir markedly increases the exposure to rifabutin. Avoid or adjust dose. [Severe] Study

Rifampicin is predicted to moderately to markedly decrease the exposure to HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, indinavir, lopinavir, saquinavir, tipranavir). Avoid. [Severe] Study

Rifampicin is predicted to increase the exposure to rifabutin and rifabutin decreases the exposure to indinavir. Avoid. [Severe] Study

Ritonavir slightly decreases the exposure to ritonavir. [Severe] Study

Ritonavir is predicted to increase the exposure to riociguat. Avoid. [Moderate] Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study  Also see TABLE 9 p. 820

Ritonavir moderately increases the exposure to rivaroxaban. Avoid. [Severe] Study

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to ruxolitinib. Adjust dose and monitor side effects. [Moderate] Study

Indinavir is predicted to increase the exposure to ruxolitinib. [Moderate] Theoretical

HIV-protease inhibitors are predicted to increase the exposure to simprevir. Avoid. [Severe] Study

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the concentration of sirolimus. Avoid. [Severe] Study

Indinavir is predicted to increase the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study

Tipranavir is predicted to decrease the exposure to sofosbuvir. Avoid. [Severe] Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to solifenacin or tamsulosin with solifenacin dose; avoid in hepatic and renal impairment. [Severe] Study

Indinavir is predicted to increase the exposure to SSRIs. (dapoxetine). Adjust dapoxetine dose. [Moderate] Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to moderately increase the exposure to SSRIs. (dapoxetine). Avoid, or adjust dapoxetine dose. [Severe] Study

St John’s Wort is predicted to decrease the exposure to HIV-protease inhibitors. Avoid. [Severe] Study

Indinavir is predicted to increase the exposure to statins (atorvastatin). Monitor and adjust dose. [Severe] Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to statins (atorvastatin). Avoid or adjust dose and monitor rhabdomyolysis. [Severe] Study

HIV-protease inhibitors slightly to moderately increase the exposure to statins (rosuvastatin). Avoid or adjust dose. [Severe] Study

Indinavir is predicted to increase the exposure to statins (simvastatin). Use with caution and adjust simvastatin dose. p. 130. [Severe] Study

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to statins (simvastatin). Avoid. [Severe] Study

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to slightly increase the exposure to sunitinib. Avoid or adjust sunitinib dose. [Moderate] Study  Also see TABLE 9 p. 820

Indinavir is predicted to increase the exposure to sunitinib. [Moderate] Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the concentration of tacrolimus. Monitor and adjust dose. [Severe] Study

Indinavir is predicted to increase the concentration of tacrolimus. [Severe] Study

Indinavir is predicted to increase the exposure to taxanes (cabazitaxel). [Moderate] Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to taxanes (paclitaxel). [Severe] Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the concentration of temsirolimus. Avoid. [Severe] Theoretical

Indinavir is predicted to increase the concentration of temsirolimus. [Moderate] Theoretical

Ritonavir is predicted to decrease the exposure to theophylline. Adjust dose. [Moderate] Study

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to moderately increase the exposure to tocasimate. Adjust dose. [Severe] Study

Indinavir is predicted to increase the exposure to tofasimate. Adjust dose. [Moderate] Theoretical

HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the exposure to totopecan. [Severe] Study

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to toremifene. [Moderate] Theoretical  Also see TABLE 9 p. 820

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to trabectedin. Avoid or adjust dose. [Severe] Theoretical

HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the concentration of trametinib. [Moderate] Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to moderately increase the exposure to trazodone. Avoid or adjust dose. [Moderate] Study

Indinavir is predicted to increase the exposure to trazodone. [Moderate] Theoretical

HIV-protease inhibitors (ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to tricyclic antidepressants. [Moderate] Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, saquinavir, tipranavir) are predicted to increase the
HIV-protease inhibitors (continued) 

exposure to ulipristal. Avoid if used for uterine fibroids. Severe Study

- Indinavir is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. Moderate Study
- Ritonavir decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 474. Severe Anecdotal

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to venlafaxine. Severe Theoretical Also see TABLE 9 p. 820

- HIV-protease inhibitors are predicted to increase the exposure to the vinca alkaloids. Severe Theoretical Also see TABLE 9 p. 820
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to Vitamin D substances (paricalcitol). Moderate Study

- Tipranavir slightly decreases the exposure to zidovudine. Avoid. Moderate Study

- Indinavir is predicted to increase the exposure to tipocyclone. Adjust dose. Moderate Study

Homotrepoline See TABLE 10 p. 820 (antimuscarinics)

Hormone replacement therapy

- Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidon, rufinamide, topiramate) are predicted to decrease the effects of Hormone replacement therapy. Moderate Anecdotal

- Hormone replacement therapy is predicted to alter the exposure to antiepileptics (lamotrigine). Moderate Theoretical

- Aprepitant is predicted to decrease the effects of Hormone replacement therapy. Moderate Anecdotal

- Bosentan is predicted to decrease the effects of Hormone replacement therapy. Moderate Anecdotal

- Hormone replacement therapy decreases the clearance of dopamine receptor agonists (ropinirole). Monitor and adjust dose. Moderate Study

- Efavirenz is predicted to decrease the effects of Hormone replacement therapy. Moderate Anecdotal

- Fosaprepitant is predicted to decrease the effects of Hormone replacement therapy. Moderate Anecdotal

- HIV-protease inhibitors (ritonavir) are predicted to decrease the effects of Hormone replacement therapy. Moderate Anecdotal

- Hormone replacement therapy is predicted to increase the risk of venous thromboembolism when given with lenalidomide. Severe Theoretical

- Oral Hormone replacement therapy is predicted to decrease the effects of levothyroxine. Moderate Theoretical

- Oral Hormone replacement therapy is predicted to decrease the effects of lithium. Moderate Theoretical

- Modafinil is predicted to decrease the effects of Hormone replacement therapy. Moderate Anecdotal

- Hormone replacement therapy is predicted to increase the exposure to monoamine-oxidase B inhibitors (selegiline). Avoid. Moderate Study

- Nevirapine is predicted to decrease the effects of Hormone replacement therapy. Moderate Anecdotal

- NSAIDs (etoricoxib) slightly increase the exposure to Hormone replacement therapy. Moderate Study

- Hormone replacement therapy is predicted to increase the risk of venous thromboembolism when given with pomalidomide. Severe Theoretical

- Rifabutin is predicted to decrease the effects of Hormone replacement therapy. Moderate Anecdotal

- Rifampicin is predicted to decrease the effects of Hormone replacement therapy. Moderate Anecdotal

- ST John’s Wort is predicted to decrease the efficacy of Hormone replacement therapy. Moderate Theoretical

- Hormone replacement therapy is predicted to increase the risk of venous thromboembolism when given with thalidomide. Severe Theoretical

Hydralazine See TABLE 8 p. 819 (hypotension)

- Diazoxide increases the risk of severe hypotension when given with hydralazine. Severe Study Also see TABLE 8 p. 819

Hydrochlorothiazide See thiazide diuretics

Hydrocortisonne See corticosteroids

Hydroflumethiazide See thiazide diuretics

Hydromorphone See opioids

Hydroxyacarbamide See TABLE 15 p. 821 (myelosuppression)

- Hydroxyacarbamide increases the risk of toxicity when given with didanosine. Avoid. Severe Study

- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with hydroxyacarbamide. Public Health England advises avoid. Severe Theoretical

- Hydroxychochloroquine is predicted to increase the effects of agalsidase. Moderate Theoretical

- Antacids decrease the absorption of hydroxychloroquine. Separate administration by at least 4 hours. Moderate Study

- Calcium salts (calcium carbonate) decrease the absorption of hydroxychloroquine. Separate administration by at least 4 hours. Moderate Study

- Hydroxychloroquine is predicted to decrease the efficacy of oral cholera vaccine. Moderate Theoretical

- H₂ receptor antagonists (cimetidine) are predicted to decrease the clearance of hydroxychloroquine. Moderate Theoretical

- Lanthanum is predicted to decrease the absorption of hydroxychloroquine. Separate administration by at least 2 hours. Moderate Theoretical

- Hydroxychloroquine is predicted to decrease the exposure to laronidase. Avoid simultaneous administration. Severe Theoretical

- Hydroxychochloroquine is predicted to increase the risk of haematological toxicity when given with penicillamine. Avoid. Severe Theoretical

- Hydroxychochloroquine is predicted to decrease efficacy rabies vaccine. Moderate Theoretical

- Hydroxyzine See antihistamines, sedating

Hyoscine See TABLE 10 p. 820 (antimuscarinics)

Ibandronic acid See bisphosphonates

Ibrutinib See TABLE 15 p. 821 (myelosuppression), TABLE 4 p. 818 (antiplatelet effects)

FOOD AND LIFESTYLE Avoid food or drink containing bitter (Seville) oranges as they are predicted to increase the exposure to ibrutinib.

- Antiarhythms (dronedarone) are predicted to increase the exposure to ibrutinib. Avoid or adjust ibrutinib dose. Severe Theoretical

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ibrutinib. Avoid. Severe Study

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ibrutinib. Avoid or adjust ibrutinib dose. Severe Theoretical

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to very markedly increase the exposure to ibrutinib. Avoid or adjust ibrutinib dose. Severe Study

- Aprepitant is predicted to increase the exposure to ibrutinib. Avoid or adjust ibrutinib dose. Severe Theoretical

- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ibrutinib. Avoid or adjust ibrutinib dose. Severe Theoretical

- Cobicistat is predicted to very markedly increase the exposure to ibrutinib. Avoid or adjust ibrutinib dose. Severe Study
Crizotinib is predicted to increase the exposure to ibritinib. Avoid or adjust ibritinib dose. **Severe** Theoretical → Also see TABLE 15 p. 821

Enzalutamide is predicted to decrease the exposure to ibritinib. Avoid. **Severe** Study

Fosaprepitant is predicted to slightly increase the exposure to ibritinib. **Moderate** Theoretical

Grapefruit juice is predicted to increase the exposure to ibritinib. Avoid. **Moderate** Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to very markedly increase the exposure to ibritinib. Avoid or adjust ibritinib dose. **Severe** Study

HIV-protease inhibitors (indinavir) are predicted to increase the exposure to ibritinib. Avoid or adjust ibritinib dose. **Severe** Study

Idelalisib is predicted to very markedly increase the exposure to ibritinib. Avoid or adjust ibritinib dose. **Severe** Study → Also see TABLE 15 p. 821

Imatinib is predicted to increase the exposure to ibritinib. Avoid or adjust ibritinib dose. **Severe** Theoretical → Also see TABLE 15 p. 821

Macrolides (clarithromycin) are predicted to very markedly increase the exposure to ibritinib. Avoid or adjust ibritinib dose. **Severe** Study

Macrolides (erythromycin) are predicted to increase the exposure to ibritinib. Avoid or adjust ibritinib dose. **Severe** Theoretical

Netupitant is predicted to increase the exposure to ibritinib. Avoid or adjust ibritinib dose. **Severe** Theoretical

Nilotinib is predicted to increase the exposure to ibritinib. Avoid or adjust ibritinib dose. **Severe** Theoretical → Also see TABLE 15 p. 821

Quinolones (ciprofloxacin) are predicted to increase the exposure to ibritinib. Avoid or adjust ibritinib dose. **Severe** Theoretical

Rifampicin is predicted to decrease the exposure to ibritinib. Avoid. **Severe** Study

St John’s Wort is predicted to decrease the exposure to ibritinib. Avoid. **Severe** Theoretical

Ibuprofen → see NSAIDs

Icatibant → see ACE inhibitors are predicted to decrease the efficacy of icatibant and icatibant is predicted to decrease the efficacy of ACE inhibitors. Avoid. **Moderate** Theoretical

Idarubicin → see anthracyclines

Idarucizumab → see monoclonal antibodies

Idelalisib → see TABLE 15 p. 821 (myelosuppression)

Idelalisib is predicted to increase the exposure to abiraterone. **Severe** Theoretical

Idelalisib is predicted to markedly increase the exposure to aldosterone antagonists (eplerenone). Avoid. **Severe** Study

Idelalisib increases the exposure to almotriptan. **Mild** Study

Idelalisib is predicted to moderately increase the exposure to alpha blockers (alfuzosin, tamsulosin). Use with caution or avoid. **Moderate** Study

Idelalisib is predicted to increase the exposure to alpha blockers (doxazosin). **Moderate** Study

Idelalisib moderately increases the exposure to alprazolam. Avoid. **Moderate** Study

Idelalisib very markedly increases the exposure to antiarrhythmics (dronedarone). Avoid. **Severe** Study

Idelalisib is predicted to increase the exposure to antiarrhythmics (propafenone). Monitor and adjust dose. **Severe** Study

Idelalisib is predicted to increase the exposure to anticholinesterases, centrally acting (galantamine). Monitor and adjust dose. **Moderate** Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to idelalisib. Avoid. **Severe** Study

Idelalisib is predicted to slightly increase the exposure to antiepileptics (perampanel). **Mild** Study

Idelalisib is predicted to increase the exposure to antifungals, azoles (isavuconazole). Avoid or monitor side effects. **Severe** Study

Idelalisib is predicted to increase the exposure to antihistamines, non-sedating (mizolastine). Avoid. **Severe** Study

Idelalisib is predicted to increase the exposure to antimalarials (artemether) with lumefantrine. **Moderate** Study

Idelalisib is predicted to increase the concentration of antimalarials (piperazine). **Severe** Theoretical

Idelalisib is predicted to markedly increase the exposure to aprepiant. **Moderate** Study

Idelalisib is predicted to slightly increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 240. **Moderate** Study

Idelalisib is predicted to increase the exposure to axitinib. Avoid or adjust dose. **Moderate** Study → Also see TABLE 15 p. 821

Idelalisib is predicted to increase the exposure to bedaquiline. Avoid prolonged use. **Mild** Study

Idelalisib is predicted to increase the exposure to beta; agonists (salmeterol). Avoid. **Severe** Study

Idelalisib slightly increases the exposure to bortezomib. **Moderate** Study → Also see TABLE 15 p. 821

Idelalisib is predicted to markedly increase the exposure to bosutinib. Avoid or adjust bosutinib dose. **Severe** Study → Also see TABLE 15 p. 821

Idelalisib is predicted to increase the exposure to buspirone. Adjust buspirone dose. **Severe** Study

Idelalisib slightly increases the exposure to cabozantinib. **Moderate** Study → Also see TABLE 15 p. 821

Idelalisib is predicted to increase the exposure to calcium channel blockers (amiodipine, felodipine, isradipine, lacidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. **Moderate** Study

Idelalisib is predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). **Severe** Study

Idelalisib is predicted to markedly increase the exposure to calcium channel blockers (lercanidipine). Avoid. **Severe** Study

Idelalisib is predicted to increase the exposure to cannabis extract. Use with caution and adjust dose. **Moderate** Theoretical

Idelalisib is predicted to increase the exposure to ceritinib. Avoid or adjust ceritinib dose. **Severe** Study → Also see TABLE 15 p. 821

Idelalisib increases the concentration of ciclesonide. **Severe** Study

Idelalisib is predicted to moderately increase the exposure to cilostazol. Adjust cilostazol dose. **Moderate** Study

Idelalisib is predicted to moderately increase the exposure to cinacalcet. Adjust dose. **Moderate** Study

Idelalisib is predicted to markedly increase the exposure to cobimetinib. Avoid or monitor for toxicity. **Severe** Study

Idelalisib is predicted to increase the exposure to colchicine. Avoid or adjust colchicine dose. **Severe** Study

Idelalisib is predicted to increase the exposure to corticosteroids (budesonide). Avoid. **Severe** Study

Idelalisib is predicted to increase the exposure to corticosteroids (ciclesonide). Avoid. **Moderate** Theoretical

Idelalisib is predicted to increase the exposure to corticosteroids (dexamethasone, methylprednisolone). Monitor and adjust dose. **Moderate** Study

Idelalisib is predicted to increase the exposure to corticosteroids (fluicasone). **Severe** Study

Idelalisib is predicted to increase the exposure to corticosteroids (mometasone). **Moderate** Theoretical

Idelalisib is predicted to increase the risk of side-effects when given with corticosteroids (triamcinolone). **Severe** Theoretical

Idelalisib is predicted to moderately increase the exposure to crizotinib. Avoid. **Moderate** Study → Also see TABLE 15 p. 821

Idelalisib is predicted to increase the exposure to dabrafenib. Use with caution or avoid. **Moderate** Study → Also see TABLE 15 p. 821

Idelalisib is predicted to moderately increase the exposure to daclatasvir. Adjust daclatasvir dose. **Moderate** Study

Idelalisib is predicted to moderately increase the exposure to dasatinib. Avoid. **Severe** Study → Also see TABLE 15 p. 821
Idelalisib (continued)

- **Idelalisib** slightly increases the exposure to delamanid.
  - **Severe** Study

- **Idelalisib** increases the risk of QT-prolongation when given with domperidone. Avoid. **Severe** Study

- **Idelalisib** increases the exposure to dopamine receptor agonists (bromocriptine, cabergoline). **Severe** Study

- **Idelalisib** is predicted to increase the exposure to dutasteride. Monitor side effects and adjust dose. **Moderate** Theoretical

- **Idelalisib** slightly to moderately increases the exposure to elbasvir. Avoid. **Moderate** Study

- **Idelalisib** is predicted to markedly increase the exposure to elinpramat. Avoid. **Severe** Study

- **Enzalutamide** is predicted to decrease the exposure to idelalisib. Avoid. **Severe** Study

- **Idelalisib** is predicted to increase the risk of ergotism when given with ergotamine. Avoid. **Severe** Theoretical

- **Idelalisib** is predicted to increase the risk of ergotism when given with ergotamine. Avoid. **Severe** Theoretical

- **Idelalisib** is predicted to slightly increase the exposure to erlotinib. Use with caution and adjust dose. **Moderate** Study

- **Idelalisib** is predicted to increase the concentration of everolimus. Avoid. **Severe** Study → Also see TABLE 15 p. 821

- **Idelalisib** is predicted to moderately increase the exposure to fexofenadine. Adjust fesoterodine dose; avoid in hepatic and renal impairment. **Severe** Study

- **Idelalisib** is predicted to increase the exposure to fosaprepitant. **Moderate** Theoretical

- **Idelalisib** is predicted to increase the exposure to gefitinib. **Moderate** Study → Also see TABLE 15 p. 821

- **Idelalisib** is predicted to moderately to markedly increase the exposure to givazoprevir. Avoid. **Severe** Study

- **Idelalisib** is predicted to increase the exposure to guanfacine. Adjust guanfacine dose, p. 222. **Moderate** Study

- **Idelalisib** is predicted to very markedly increase the exposure to ibrutinib. Avoid or adjust ibrutinib dose. **Severe** Study → Also see TABLE 15 p. 821

- **Idelalisib** is predicted to increase the exposure to imevatinib. **Moderate** Study → Also see TABLE 15 p. 821

- **Idelalisib** is predicted to increase the risk of toxicity when given with irinotecan. Avoid. **Moderate** Study → Also see TABLE 15 p. 821

- **Idelalisib** is predicted to increase the exposure to ivabradine. Avoid. **Severe** Study

- **Idelalisib** is predicted to increase the exposure to ivacaftor. Adjust ivacaftor or lumacaftor with ivacaftor dose, p. 179. **Severe** Study

- **Idelalisib** is predicted to increase the exposure to lpatinib. Avoid. **Moderate** Study

- **Idelalisib** is predicted to markedly increase the exposure to lomiptamide. Avoid. **Severe** Study

- **Idelalisib** is predicted to increase the exposure to lurasidone. Avoid. **Severe** Study

- **Idelalisib** is predicted to increase the exposure to macitentan. **Moderate** Study

- **Idelalisib** markedly increases the exposure to maraviroc. Adjust dose. **Severe** Theoretical

- **Idelalisib** is predicted to markedly to very markedly increase the exposure to midazolam. Avoid or adjust midazolam dose. **Severe** Study

- **Idelalisib** is predicted to increase the exposure to mirabegron. Adjust mirabegron dose in hepatic and renal impairment. **Moderate** Study

- **Idelalisib** is predicted to increase the exposure to mirtazapine. **Moderate** Study

- **Idelalisib** is predicted to increase the exposure to modafinil. **Moderate** Theoretical

- **Idelalisib** is predicted to increase the exposure to monoclonal antibodies (trastuzumab emtansine). Avoid. **Severe** Theoretical

- **Idelalisib** is predicted to markedly increase the exposure to naloxegol. Avoid. **Severe** Study

- **Idelalisib** is predicted to increase the exposure to netupitant. **Moderate** Study

- **Idelalisib** is predicted to moderately increase the exposure to nilotinib. Avoid. **Severe** Study → Also see TABLE 15 p. 821

- **Idelalisib** is predicted to increase the exposure to nitrosine. Adjust nitrosine dose, p. 585. **Moderate** Theoretical

- **Idelalisib** is predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose. **Moderate** Study → Also see TABLE 15 p. 821

- **Idelalisib** is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone, sufentanil). Monitor and adjust dose. **Severe** Study

- **Idelalisib** is predicted to increase the exposure to opioids (methadone). **Moderate** Theoretical

- **Idelalisib** is predicted to increase the exposure to oxbutynin. **Moderate** Study

- **Idelalisib** is predicted to increase the exposure to palbociclib. Avoid or adjust palbociclib dose. **Severe** Study

- **Idelalisib** is predicted to increase the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid. **Moderate** Study → Also see TABLE 15 p. 821

- **Idelalisib** is predicted to increase the exposure to parpaltrevir (with ritonavir and omibatasvir). Avoid. **Severe** Theoretical

- **Idelalisib** is predicted to increase the exposure to paxopanib. Avoid or adjust paxopanib dose. **Moderate** Study → Also see TABLE 15 p. 821

- **Idelalisib** is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil, vardenafil). Avoid. **Severe** Study

- **Idelalisib** is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Avoid or adjust sildenafil dose, p. 117. **Severe** Study

- **Idelalisib** is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (taladafil). Use with caution or avoid. **Severe** Study

- **Idelalisib** is predicted to increase the exposure to pimozone. Avoid. **Severe** Study

- **Idelalisib** is predicted to slightly increase the exposure to pontatinib. Monitor and adjust pontatinib dose. **Moderate** Study

- **Idelalisib** is predicted to moderately increase the exposure to praziquantel. **Moderate** Study

- **Idelalisib** is predicted to increase the exposure to quetiapine. Avoid. **Severe** Study

- **Idelalisib** is predicted to increase the exposure to ranolazine. Avoid. **Severe** Study

- **Idelalisib** is predicted to increase the exposure to reboxetine. Avoid. **Moderate** Study

- **Idelalisib** is predicted to increase the exposure to regorafenib. Avoid. **Moderate** Study → Also see TABLE 15 p. 821

- **Idelalisib** is predicted to increase the exposure to regaprinide. **Moderate** Study

- **Idelalisib** is predicted to increase the exposure to retinoids (alitretinoin). Adjust alitretinoin dose. **Moderate** Theoretical

- **Rifampicin** is predicted to decrease the exposure to idelalisib. Avoid. **Severe** Study

- **Idelalisib** is predicted to increase the exposure to risperidone. Adjust dose. **Moderate** Study

- **Idelalisib** is predicted to increase the exposure to ruoxatinib. Adjust dose and monitor side effects. **Moderate** Study → Also see TABLE 15 p. 821

- **Idelalisib** is predicted to increase the exposure to saxagliptin. **Moderate** Study

- **Idelalisib** is predicted to increase the exposure to simpepreivir. Avoid. **Severe** Study

- **Idelalisib** is predicted to increase the concentration of sirolimus. Avoid. **Severe** Study

- **Idelalisib** is predicted to increase the exposure to solifenacin. Adjust solifenacin or tamsulosin with solifenacin dose; avoid in hepatic and renal impairment. **Severe** Study

- **Idelalisib** is predicted to moderately increase the exposure to SSRIs. (dopoxetine). Avoid, or adjust dopoxetine dose. **Severe** Study

- **St John’s Wort** is predicted to decrease the exposure to idelalisib. Avoid. **Severe** Theoretical

- **Idelalisib** is predicted to increase the exposure to statins (atorvastatin). Avoid or adjust dose and monitor rhabdoymylosis. **Severe** Study
Idelalisib – Imatinib

Idelalisib is predicted to increase the exposure to statins (simvastatin). Avoid. [Severe] Study

Idelalisib is predicted to slightly increase the exposure to sunitinib. Avoid or adjust sunitinib dose. [Moderate] Study → Also see TABLE 15 p. 821

Idelalisib is predicted to increase the concentration of tacrolimus. Monitor and adjust dose. [Severe] Study

Idelalisib is predicted to increase the exposure to taxanes (cabazitaxel). Avoid. [Severe] Study → Also see TABLE 15 p. 821

Idelalisib is predicted to moderately increase the exposure to taxanes (docetaxel). Avoid or adjust dose. [Severe] Study → Also see TABLE 15 p. 821

Idelalisib is predicted to increase the exposure to taxanes (paclitaxel). [Severe] Theoretical → Also see TABLE 15 p. 821

Idelalisib is predicted to increase the concentration of temsirolimus. Avoid. [Severe] Theoretical → Also see TABLE 15 p. 821

Idelalisib is predicted to markedly increase the exposure to ticagrelor. Avoid. [Severe] Study

Idelalisib is predicted to increase the exposure to tolvaptan. Adjust dose. [Severe] Study

Idelalisib is predicted to increase the exposure to toremifene. [Moderate] Theoretical

Idelalisib is predicted to increase the exposure to trabectedin. Avoid or adjust dose. [Severe] Theoretical → Also see TABLE 15 p. 821

Idelalisib is predicted to moderately increase the exposure to trazodone. Avoid or adjust dose. [Moderate] Study

Idelalisib is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Severe] Study

Idelalisib is predicted to increase the exposure to vemurafenib. [Severe] Theoretical

Idelalisib is predicted to increase the exposure to venetoclax. Avoid or adjust venetoclax dose. [Severe] Study

Idelalisib is predicted to increase the exposure to venlafaxine. [Moderate] Study

Idelalisib is predicted to increase the exposure to vinca alkaloids. [Severe] Theoretical → Also see TABLE 15 p. 821

Idelalisib is predicted to increase the exposure to vitamin D substances (paricalcitol). [Moderate] Study

Idelalisib is predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Theoretical

Idelalisib is predicted to increase the exposure to alkylating agents

Iloprost → Also see TABLE 4 p. 818 (antiplatelet effects)

Imatinib → See TABLE 15 p. 821 (myelosuppression)

Imatinib is predicted to increase the exposure to aldosterone antagonists (eplerenone). Adjust eplerenone dose. [Severe] Study

Imatinib is predicted to increase the exposure to alpha blockers (tamsulosin). [Moderate] Theoretical

Imatinib is predicted to increase the exposure to alfuzosin. [Severe] Study

Imatinib is predicted to increase the exposure to antiarrhythmics (droxidopa). [Severe] Theoretical

Imatinib is predicted to increase the exposure to antiarrhythmics (propafenone). Monitor and adjust dose. [Moderate] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to imatinib. Avoid. [Moderate] Study

Antiepileptics (oxcarbazepine) decrease the exposure to imatinib. Avoid. [Moderate] Study

Antifungals, azoles (fluconazole, posaconazole) are predicted to increase the exposure to imatinib. [Moderate] Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to imatinib. [Moderate] Theoretical

Imatinib is predicted to decrease the exposure to antifungals, azoles (isavuconazole). [Moderate] Theoretical

Imatinib is predicted to increase the exposure to antihistamines, non-sedating (mizolastine). [Severe] Theoretical

Imatinib is predicted to increase the concentration of antimalarials (piperaquine). [Severe] Theoretical

Aprepitant is predicted to increase the exposure to imatinib. [Moderate] Theoretical

Asparaginase is predicted to increase the risk of hepatotoxicity when given with imatinib. [Severe] Theoretical → Also see TABLE 15 p. 821

Imatinib is predicted to increase the exposure to axitinib. [Moderate] Theoretical → Also see TABLE 15 p. 821

Imatinib is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical

Bozertan is predicted to decrease the exposure to imatinib. [Moderate] Study

Imatinib is predicted to increase the exposure to bosutinib. Avoid or adjust bosutinib dose. [Severe] Theoretical → Also see TABLE 15 p. 821

Imatinib is predicted to increase the exposure to buspirone. Use with caution and adjust dose. [Moderate] Study

Imatinib is predicted to increase the exposure to cabozantinib. [Moderate] Theoretical → Also see TABLE 15 p. 821

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to imatinib. [Moderate] Theoretical

Imatinib is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study

Imatinib is predicted to increase the exposure to ceritinib. [Moderate] Theoretical

Imatinib is predicted to increase the exposure to cobimetinib. [Severe] Theoretical

Imatinib is predicted to increase the exposure to colchicine. Adjust colchicine dose. [Severe] Study

Imatinib is predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. [Moderate] Study

Imatinib is predicted to increase the risk of bleeding events when given with coumarins. [Severe] Theoretical

Crisantaspase is predicted to increase the risk of hepatotoxicity when given with imatinib. [Severe] Theoretical → Also see TABLE 15 p. 821

Imatinib is predicted to slightly increase the exposure to darifenacin. [Moderate] Study

Imatinib is predicted to increase the exposure to dasatinib. [Severe] Study → Also see TABLE 15 p. 821

Imatinib increases the risk of QT-prolongation when given with domperidone. Avoid. [Severe] Study

Imatinib is predicted to increase the exposure to dopamine receptor agonists (bromocriptine, cabergoline). [Severe] Theoretical

Imatinib is predicted to moderately increase the exposure to dutasteride. [Mild] Study

Efavirenz is predicted to decrease the exposure to imatinib. [Moderate] Study

Enzalutamide is predicted to decrease the exposure to imatinib. Avoid. [Moderate] Study

Imatinib is predicted to increase the risk of ergotism when given with ergometrine. [Severe] Theoretical

Imatinib is predicted to increase the risk of ergotism when given with ergotamine. [Severe] Theoretical

Imatinib is predicted to increase the exposure to erlotinib. [Moderate] Theoretical

Imatinib is predicted to increase the concentration of everolimus. Avoid or adjust dose. [Moderate] Study → Also see TABLE 15 p. 821

Imatinib is predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose in hepatic and renal impairment. [Mild] Study

Imatinib is predicted to increase the exposure to gefitinib. [Moderate] Theoretical → Also see TABLE 15 p. 821

Grapefruit juice is predicted to increase the exposure to imatinib. [Moderate] Theoretical

Imatinib is predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 222. [Moderate] Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to imatinib. [Moderate] Study
Imatinib (continued)

- **Imatinib** is predicted to increase the exposure to **ibrutinib**. Avoid or adjust ibrutinib dose. (Severe) Theoretical  Also see TABLE 15 p. 821
- **Idelalisib** is predicted to increase the exposure to imatinib. (Moderate) Study  Also see TABLE 15 p. 821
- **Imatinib** is predicted to increase the exposure to **ivabradine**. Adjust ivabradine dose. (Severe) Theoretical
- **Imatinib** is predicted to increase the exposure to **ivaftor**. Adjust ivaftor dose, p. 179. (Severe) Study
- **Imatinib** is predicted to increase the exposure to **lapatinib**. (Moderate) Study
- **Imatinib** is predicted to increase the exposure to losartan. Monitor side effects and adjust dose. (Severe) Study
- **Imatinib** is predicted to increase the exposure to **naloxegol**. Adjust naloxegol dose and monitor side effects. (Moderate) Study
- **Macrolides (clarithromycin)** are predicted to increase the exposure to imatinib. (Moderate) Study
- **Macrolides (erythromycin)** are predicted to increase the exposure to imatinib. (Moderate) Theoretical
- **Imatinib** is predicted to increase the exposure to **midazolam**. Monitor side effects and adjust dose. (Severe) Study
- **Imatinib** is predicted to increase the exposure to **morphine**. Adjust morphine dose. (Moderate) Study
- **Imatinib** is predicted to increase the exposure to **naproxen**. Adjust naproxen dose and monitor side effects. (Moderate) Study
- **Imatinib** is predicted to increase the exposure to **nitroglycerine**. Adjust nitroglycerine dose and monitor side effects. (Moderate) Study
- **Imatinib** is predicted to increase the exposure to **nzaftorvastatin**. Adjust nzaftorvastatin dose and monitor side effects. (Moderate) Study
- **Imatinib** is predicted to increase the exposure to **olaparib**. Avoid or adjust olaparib dose. (Moderate) Theoretical  Also see TABLE 15 p. 821
- **Imatinib** is predicted to increase the exposure to **opioids (alfentanil, buprenorphine, fentanyl, oxycodone)**. Monitor and adjust dose. (Moderate) Study
- **Imatinib** is predicted to increase the exposure to **opioids (methadone, sufentanil)**. (Moderate) Theoretical
- **Imatinib** is predicted to increase the exposure to **oxybutynin**. (Mild) Theoretical
- **Imatinib** increases the risk of hepatotoxicity when given with **paracetamol**. (Severe) Anecdotal
- **Imatinib** is predicted to increase the exposure to **pazopanib**. (Moderate) Theoretical  Also see TABLE 15 p. 821
- **Pegaspargase** is predicted to increase the risk of hepatotoxicity when given with imatinib. (Severe) Theoretical  Also see TABLE 15 p. 821
- **Imatinib** is predicted to increase the risk of bleeding events when given with **phenindione**. (Severe) Theoretical
- **Imatinib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (avanafil)**. Adjust avanafil dose. (Moderate) Theoretical
- **Imatinib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (sildenafil)**. Monitor and adjust sildenafil dose, p. 177. (Moderate) Study
- **Imatinib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (tadalafil)**. (Severe) Theoretical
- **Imatinib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (vardenafil)**. Adjust dose. (Severe) Theoretical
- **Imatinib** is predicted to increase the exposure to **pimozide**. Avoid. (Severe) Theoretical
- **Imatinib** is predicted to increase the exposure to **quetiapine**. Avoid. (Moderate) Study
- **Imatinib** is predicted to increase the exposure to **ranolazine**. (Severe) Study
- **Rifampicin** is predicted to decrease the exposure to imatinib. Avoid. (Moderate) Study
- **Imatinib** is predicted to increase the exposure to **ruboxistaurin**. (Moderate) Theoretical  Also see TABLE 15 p. 821
- **Imatinib** is predicted to increase the exposure to **saxagliptin**. (Mild) Study
- **Imatinib** is predicted to increase the exposure to **siemprevir**. Avoid. (Severe) Study
- **Imatinib** increases the concentration of **sirolimus**. Monitor and adjust dose. (Moderate) Study
- **Imatinib** is predicted to increase the exposure to **SSRIs (dopoxetine)**. Adjust dopoxetine dose. (Moderate) Theoretical
- **St John’s Wort** is predicted to decrease the exposure to imatinib. (Moderate) Study
- **Imatinib** is predicted to increase the exposure to **statins (atorvastatin)**. Monitor and adjust dose. (Severe) Theoretical
- **Imatinib** is predicted to increase the exposure to **statins (simvastatin)**. Use with caution and adjust simvastatin dose, p. 130. (Severe) Study
- **Imatinib** is predicted to increase the exposure to **sunitinib**. (Moderate) Theoretical  Also see TABLE 15 p. 821
- **Imatinib** is predicted to increase the concentration of **tacrolimus**. (Severe) Study
- **Imatinib** is predicted to increase the exposure to **taxanes (cabazitaxel)**. (Moderate) Theoretical  Also see TABLE 15 p. 821
- **Tedizolid** is predicted to increase the exposure to imatinib. Avoid. (Moderate) Theoretical
- **Imatinib** is predicted to increase the concentration of **tepsiroimus**. (Moderate) Theoretical  Also see TABLE 15 p. 821
- **Imatinib** is predicted to increase the exposure to **tolerodine**. (Mild) Theoretical
- **Imatinib** is predicted to increase the exposure to **tolvaptan**. Adjust dose. (Moderate) Theoretical
- **Imatinib** is predicted to increase the exposure to **trazodone**. (Moderate) Theoretical
- **Imatinib** is predicted to increase the exposure to **uroliths**. Avoid if used for uterine fibroids. (Moderate) Study
- **Imatinib** is predicted to increase the exposure to **venetoclax**. Avoid or adjust venetoclax dose. (Severe) Study
- **Imatinib** is predicted to increase the exposure to **vopizafone**. Adjust dose. (Moderate) Study
- **Imidapril**  see ACE inhibitors
- **Imipenem**  see carbapenems
- **Imipramine**  see tricyclic antidepressants
- **Indacaterol**  see beta, agonists
- **Indapamide**  see thiazide diuretics
- **Indinavir**  see HIV-protease inhibitors
- **Indometacin**  see NSAIDs
- **Indoramin**  see alpha blockers
- **Infliximab**  see monoclonal antibodies
- **Influenza vaccine**  see live vaccines
- **Insulin**  see insulins
- **Insulin aspart**  see insulins
- **Insulin degludec**  see insulins
- **Insulin detemir**  see insulins
- **Insulin glargine**  see insulins
- **Insulin glulisine**  see insulins
- **Insulin lispro**  see insulins
- **Insulin zinc suspension**  see insulins
- **Insulins**  see **TABLE 14 p. 821 (antidiabetic drugs)**
- **Biphasic insulin aspart** - biphasic insulin lispro - biphasic isophane insulin - insulin - insulin aspart - insulin degludec - insulin detemir - insulin glargine - insulin glulisine - insulin lispro - insulin zinc suspension - isophane insulin - protamine zinc insulin
- **Fibrates** are predicted to increase the risk of hypoglycaemia when given with insulins. (Moderate) Theoretical
- **Interferon alfa**  see interferons
- **Interferon beta**  see interferons
- **Interferons**  see **TABLE 15 p. 821 (myelosuppression)**
- **Interferon alfa - interferon beta - peginterferon alfa**
- **Interferons** are predicted to slightly increase the exposure to **aminophylline**. Adjust dose. (Moderate) Theoretical
- **Interferon alfa** is predicted to increase the risk of peripheral neuropathy when given with **telbivudine**. Avoid. (Severe) Theoretical
- **Peginterferon alfa** increases the risk of peripheral neuropathy when given with **telbivudine**. Avoid. (Severe) Study
- **Interferons** slightly increase the exposure to **theophylline**. Adjust dose. (Moderate) Study
- **Ipilimumab**  see monoclonal antibodies
- **Ipratropium**  see **TABLE 10 p. 820 (antimuscarinics)**
> Beta, agonists are predicted to increase the risk of glaucoma when given with ipratropium. [Moderate] Anecdotal

Irbesartan → see angiotensin-II receptor antagonists

Irinotecan → see TABLE 15 p. 821 (myelosuppression)

> Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to irinotecan. Avoid. [Severe] Study

> Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the risk of toxicity when given with irinotecan. Avoid. [Moderate] Study

Cobicistat is predicted to increase the risk of toxicity when given with irinotecan. Avoid. [Moderate] Study

Enzalutamide is predicted to decrease the exposure to irinotecan. Avoid. [Severe] Study

HIV- protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the risk of toxicity when given with irinotecan. Avoid. [Moderate] Study

Idelalisib is predicted to increase the risk of toxicity when given with irinotecan. Avoid. [Moderate] Study → Also see TABLE 15 p. 821

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with irinotecan. Public Health England advises avoid. [Theoretical]

Macrolides (clarithromycin) are predicted to increase the risk of toxicity when given with irinotecan. Avoid. [Moderate] Study

Irinotecan is predicted to decrease the effects of neuromuscular blocking drugs, non-depolarising. [Moderate] Theoretical

Pitolisant is expected to decrease the exposure to irinotecan. [Unknown] Theoretical

Rifaximin is predicted to decrease the exposure to irinotecan. Avoid. [Severe] Study

St John’s Wort slightly decreases the exposure to irinotecan. Avoid. [Severe] Study

Irinotecan is predicted to increase the risk of prolonged neuromuscular blockade when given with saxumethonium. [Moderate] Theoretical

Iron (injectable)

ferric carboxymaltose - iron dextran - iron isomaltoside 1000 - iron sucrose

> Chloramphenicol decreases the efficacy of intravenous iron (injectable). [Moderate] Anecdotal

Iron (oral)

ferric maltol - ferrous fumarate - ferrous gluconate - ferrous sulfate - polysaccharide-iron complex - sodium feredetate

> Antacids decrease the absorption of iron (oral). Iron (oral) should be taken 1 hour before or 2 hours after antacids. [Moderate] Study

Iron (oral) is predicted to decrease the absorption of oral bisphosphonates (ibandronic acid). Avoid iron (oral) for at least 6 hours before or 1 hour after ibandronic acid. [Moderate] Theoretical

Iron (oral) decreases the absorption of bisphosphonates (risedronate). Separate administration by at least 2 hours. [Moderate] Study

Iron (oral) decreases the absorption of bisphosphonates (sodium clodronate). Avoid iron (oral) for 2 hours before or 1 hour after sodium clodronate. [Moderate] Study

Calcium salts (calcium carbonate) decrease the absorption of iron (oral). Calcium carbonate should be taken 1 hour before or 2 hours after iron (oral). [Moderate] Study

> Iron (oral) is predicted to decrease the exposure to carbidopa. [Moderate] Theoretical

Chloramphenicol decreases the efficacy of oral iron (oral). [Moderate] Theoretical

Iron (oral) decreases the absorption of doliprane. Iron (oral) should be taken 6 hours before or 4 hours after iron (oral). [Severe] Theoretical

Iron (oral) is predicted to decrease the absorption of entacapone. Separate administration by at least 2 hours. [Moderate] Theoretical

Iron (oral) decreases the absorption of levodopa. [Moderate] Study

Iron (oral) decreases the absorption of levotirothroxine. Separate administration by at least 4 hours. [Moderate] Study

Iron (oral) decreases the effects of methyldopa. [Moderate] Study

Iron (oral) is predicted to decrease the absorption of penicillamine. Separate administration by at least 2 hours. [Mild] Study

Iron (oral) decreases the exposure to quinolones. Separate administration by at least 2 hours. [Moderate] Study

Iron (oral) decreases the absorption of tetracyclines. Tetracyclines should be taken 2 to 3 hours after iron (oral). [Moderate] Study

Trientine potentially decreases the absorption of iron (oral). [Moderate] Theoretical

Zinc is predicted to decrease the efficacy of iron (oral) and iron (oral) is predicted to decrease the efficacy of zinc. [Moderate] Study

Iron chelators

deferasirox - desferrioxamine - dextrozoxane

> Deferasirox is predicted to increase the exposure to aminophylline. Avoid. [Moderate] Theoretical

Antacids (aluminium hydroxide) are predicted to decrease the exposure to deferasirox. Avoid. [Moderate] Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to deferasirox. Monitor serum ferritin and adjust dose. [Moderate] Theoretical

Ascorbic acid is predicted to increase the risk of cardiovascular side-effects when given with desferrioxamine. [Severe] Theoretical

Aspirin (high-dose) is predicted to increase the risk of gastrointestinal bleeds when given with deferasirox. [Severe] Theoretical

Bisphosphonates are predicted to increase the risk of gastrointestinal bleeding when given with deferasirox. [Severe] Theoretical

Deferasirox is predicted to increase the exposure to clozapine. Avoid. [Moderate] Theoretical

Corticosteroids are predicted to increase the risk of gastrointestinal bleeding when given with deferasirox. [Severe] Theoretical

HIV- protease inhibitors (ritonavir) are predicted to decrease the exposure to deferasirox. Monitor serum ferritin and adjust dose. [Moderate] Theoretical

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with dextrozoxane. Avoid. [Severe] Theoretical

NSAIDs are predicted to increase the risk of gastrointestinal bleeding when given with deferasirox. [Severe] Theoretical

Deferasirox moderately increases the exposure to repaglinide. Avoid. [Moderate] Study

Rifaximin is predicted to decrease the exposure to deferasirox. Monitor serum ferritin and adjust dose. [Moderate] Study

Deferasirox increases the exposure to theophylline. Avoid. [Moderate] Study

Deferasirox is predicted to increase the exposure to tizanidine. Avoid. [Moderate] Theoretical

Iron dextran → see iron (injectable)

Iron isomaltoside 1000 → see iron (injectable)

Iron sucrose → see iron (injectable)

Isavuconazole → see antifungals, azoles

Isocarboxazid → see monoamine-oxidase A and B inhibitors, irreversible

Isotofuran → see volatile halogenated anaesthetics

Isomethpene → see sympathomimetics, vasoconstrictor

Isoniazid → see TABLE 1 p. 818 (hepatotoxicity), TABLE 12 p. 821 (peripheral neuropathy)

**FOOD AND LIFESTYLE** Avoid tyramine or histamine rich foods, as tachycardia, palpitation, hypotension, flushing, headache, dizziness, and sweating reported.
Isoniazid (continued)

- Isoniazid is predicted to affect the clearance of aminophylline.
  
  **Severe** Theoretical

- Isoniazid markedly increases the concentration of antiepileptics (carbamazepine) and antiepileptics (carbamazepine) increase the risk of hepatotoxicity when given with isoniazid. Monitor carbamazepine concentration and adjust dose. **Severe** Study → Also see TABLE 1 p. 818

- Isoniazid increases the concentration of antiepileptics (fosphenytoin, phenytoin). **Moderate** Study → Also see TABLE 12 p. 821

- Cycloserine increases the risk of CNS toxicity when given with isoniazid. Monitor and adjust dose. **Moderate** Study

- Isoniazid is predicted to increase the risk of peripheral neuropathy when given with didanosine. **Severe** Theoretical → Also see TABLE 1 p. 818 → Also see TABLE 12 p. 821

- Isoniazid increases the risk of optic neuropathy when given with etambutol. **Severe** Anecdotal

- Isoniazid decreases the effects of levodopa. **Moderate** Study

- Isoniazid is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. **Unknown** Theoretical → Also see TABLE 1 p. 818

- Isoniazid is predicted to increase the risk of peripheral neuropathy when given with stavudine. **Severe** theoretical → Also see TABLE 12 p. 821

- Isoniazid is predicted to affect the clearance of theophylline.
  
  **Severe** Anecdotal

- Isoflavone insulin → see insulins

- Isoosorbide dinitrate → see nitrates

- Isoosorbide mononitrate → see nitrates

- Isotretinoin → see retinoids

- Itraconazole → see antifungals, azoles

- Ixabradine → see TABLE 6 p. 819 (bradycardia), TABLE 9 p. 820 (QT-interval prolongation)

- Antiarrhythmics (dronedarone) are predicted to increase the exposure to ivabradine. Adjust ivabradine dose. **Severe** Theoretical

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ivabradine. Adjust dose. **Moderate** Theoretical

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ivabradine. Adjust ivabradine dose. **Severe** Theoretical

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ivabradine. Adjust ivabradine dose, p. 179. **Severe** Study

- Aprepitant is predicted to increase the exposure to ivabradine. Adjust ivabradine dose. **Severe** Theoretical

- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ivabradine. Adjust ivabradine dose. **Severe** Study

- Cobicistat is predicted to increase the exposure to ivacafitor. Adjust ivacafitor or lumacaftor with ivacafitor dose, p. 179. **Severe** Study

- Ixacozanib is predicted to increase the anticoagulant effect of coumarins (warfarin). **Severe** Theoretical

- Crizotinib is predicted to increase the exposure to ivacafitor. Adjust ivacafitor dose, p. 179. **Severe** Study

- Enalapril markedly decreases the exposure to ivacafitor. Avoid. **Severe** Study

- Irritant (dronedarone) is predicted to increase the exposure to ivacafitor. Avoid. **Severe** Study

- HIV- or protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the dosing to ivacafitor. Adjust ivacafitor dose, p. 179. **Severe** Study

- Idelalisib is predicted to increase the exposure to ivacafitor. Adjust ivacafitor or lumacaftor with ivacafitor dose, p. 179. **Severe** Study

- Ivermectin potentially increases the anticoagulant effect of coumarins. **Severe** Anecdotal

- Levamisole increases the exposure to ivermectin. **Moderate** Study

- Ixazomib is predicted to increase the exposure to ivacafitor. Adjust ivacafitor dose. **Severe** Theoretical

- Nitotinib is predicted to increase the exposure to ivacafitor. Adjust ivacafitor dose. **Severe** Theoretical

- Rifampicin is predicted to decrease the exposure to ivacafitor. Adjust dose. **Moderate** Theoretical

- St John’s Wort decreases the exposure to ivacafitor. Avoid. **Severe** Study

- Ixazomib is predicted to decrease the exposure to ivacafitor. Avoid. **Severe** Study

- Ixazomib is predicted to increase the exposure to ivacafitor. Adjust ivacafitor dose. **Severe** Theoretical

- Ixazomib is predicted to increase the exposure to ivacafitor. Adjust ivacafitor dose. **Severe** Theoretical

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ivacafitor. Avoid. **Severe** Study

- Ixazomib is predicted to increase the exposure to ivacafitor. Adjust ivacafitor dose. **Severe** Theoretical

- Ixazomib is predicted to increase the exposure to ivacafitor. Adjust ivacafitor dose. **Severe** Theoretical

- Ixazomib is predicted to increase the exposure to ivacafitor. Adjust ivacafitor dose. **Severe** Theoretical

- Ixazomib is predicted to increase the exposure to ivacafitor. Adjust ivacafitor dose. **Severe** Theoretical

- Ixazomib is predicted to increase the exposure to ivacafitor. Adjust ivacafitor dose. **Severe** Theoretical

- Ixazomib is predicted to increase the exposure to ivacafitor. Adjust ivacafitor dose. **Severe** Theoretical

- Ixazomib is predicted to increase the exposure to ivacafitor. Adjust ivacafitor dose. **Severe** Theoretical

- Ixazomib is predicted to increase the exposure to ivacafitor. Adjust ivacafitor dose. **Severe** Theoretical
- **Rifampicin** is predicted to decrease the exposure to **ixazomib**. Avoid. [Severe] Study
- **St John's Wort** is predicted to decrease the exposure to **ixazomib**. Avoid. [Severe] Theoretical
- **Ixekizumab** → see monoclonal antibodies
- **Kaolin**
  - **Kaolin** is predicted to decrease the absorption of **tetracyclines**. [Moderate] Theoretical
- **Ketamine** → see TABLE 8 p. 819 (hypotension), **TABLE 11** p. 820 (CNS depressant effects)
- **Memantine** is predicted to increase the risk of CNS side-effects when given with **ketamine**. Avoid. [Severe] Theoretical
- **Ketoconazole** → see antifungals, azoles
- **Ketoprofen** → see NSAIDs
- **Ketorolac** → see NSAIDs
- **Ketotifen** → see antihistamines, sedating
- **Labetalol** → see beta blockers, non-selective
- **Lacidipine** → see calcium channel blockers
- **Lacosamide** → see antiepileptics
- **Lamivudine** → see TABLE 12 p. 821 (peripheral neuropathy)
- **Trimethoprim** slightly increases the exposure to **lamivudine**. [Moderate] Study
- **Lamotrigin**e → see antiepileptics
- **Lanreotide**
  - **Beta blockers, non-selective** are predicted to increase the risk of bradycardia when given with **lanreotide**. [Moderate] Theoretical
  - **Beta blockers, selective** are predicted to increase the risk of bradycardia when given with **lanreotide**. [Moderate] Theoretical
  - **Lanreotide** is predicted to decrease the absorption of oral **ciclosporin**. Adjust dose. [Severe] Theoretical
- **Lansoprazole** → see proton pump inhibitors
- **Lanthanum**
  - **Lanthanum** is predicted to decrease the absorption of antifungals, azoles (**ketoconazole**). Separate administration by at least 2 hours. [Moderate] Theoretical
  - **Lanthanum** is predicted to decrease the absorption of antimalariais (**chloroquine**). Separate administration by at least 2 hours. [Moderate] Theoretical
  - **Lanthanum** is predicted to decrease the absorption of **hydroxychloroquine**. Separate administration by at least 2 hours. [Moderate] Theoretical
  - **Lanthanum** decreases the absorption of **levothyroxine**. Separate administration by 2 hours. [Moderate] Study
  - **Lanthanum** decreases the absorption of **liothyronine**. Separate administration by 2 hours. [Moderate] Study
  - **Lanthanum** moderately decreases the exposure to **quinolones**. Quinolones should be taken 2 hours before or 4 hours after lanthanum. [Moderate] Study
  - **Lanthanum** is predicted to decrease the absorption of **tetracyclines**. Separate administration by 2 hours. [Moderate] Theoretical
- **Lapatinib** → see TABLE 9 p. 820 (QT-interval prolongation)
  - **Lapatinib** is predicted to increase the exposure to **afatinib**. Separate administration by 12 hours. [Moderate] Study
  - **Lapatinib** is predicted to increase the exposure to **aliskiren**. [Moderate] Theoretical
  - **Antacids** are predicted to decrease the absorption of lapatinib. Avoid. [Moderate] Theoretical
  - **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to lapatinib. [Moderate] Study → Also see **TABLE 9** p. 820
  - **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to lapatinib. Avoid. [Severe] Study
  - **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to lapatinib. [Moderate] Study
  - **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to lapatinib. Avoid. [Moderate] Study → Also see **TABLE 9** p. 820
  - **Lapatinib** is predicted to increase the exposure to antihistamines, non-sedating (**fexofenadine**). [Moderate] Theoretical
  - **Aprepitant** is predicted to increase the exposure to lapatinib. [Moderate] Study
  - **Lapatinib** is predicted to increase the exposure to beta blockers, non-selective (**nadolol**). [Moderate] Study
  - **Bosantan** is predicted to decrease the exposure to lapatinib. Avoid. [Severe] Study
  - **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to lapatinib. [Moderate] Study
  - **Lapatinib** is predicted to increase the exposure to **ceritinib**. [Moderate] Theoretical → Also see **TABLE 9** p. 820
  - **Cobicistat** is predicted to increase the exposure to lapatinib. Avoid. [Moderate] Study
  - **Lapatinib** is predicted to increase the exposure to **colchicine**. Avoid or adjust colchicine dose. [Moderate] Theoretical
  - **Lapatinib** is predicted to increase the risk of bleeding events when given with **coumarins**. [Severe] Theoretical
  - **Crizotinib** is predicted to increase the exposure to **lapatinib**. [Moderate] Study → Also see **TABLE 9** p. 820
  - **Lapatinib** is predicted to increase the exposure to **dabigatran**. [Severe] Theoretical
  - **Lapatinib** is predicted to increase the exposure to **digoxin**. [Moderate] Theoretical
  - **Lapatinib** is predicted to slightly increase the exposure to **edoxaban**. [Severe] Theoretical
  - **Efavirenz** is predicted to decrease the exposure to lapatinib. Avoid. [Severe] Study
  - **Enzalutamide** is predicted to decrease the exposure to lapatinib. Avoid. [Severe] Study
  - **Lapatinib** is predicted to increase the exposure to **erlotinib**. [Moderate] Theoretical
  - **Lapatinib** is predicted to increase the exposure to **everolimus**. [Moderate] Study
  - **Lapatinib** is predicted to increase the exposure to **fidasomicin**. Avoid. [Moderate] Study
  - **Grapefruit juice** is predicted to increase the exposure to lapatinib. Avoid. [Moderate] Theoretical
  - **H2 receptor antagonists** are predicted to decrease the absorption of lapatinib. Avoid. [Moderate] Theoretical
  - **HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to increase the exposure to lapatinib. Avoid. [Moderate] Study → Also see **TABLE 9** p. 820
  - **HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to lapatinib. [Moderate] Study
  - **Idecalisib** is predicted to increase the exposure to lapatinib. Avoid. [Moderate] Study
  - **Imatinib** is predicted to increase the exposure to lapatinib. [Moderate] Study
  - **Lapatinib** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
  - **Lapatinib** is predicted to increase the exposure to **loperamide**. [Moderate] Theoretical
  - **Macrolides (clarithromycin)** are predicted to increase the exposure to lapatinib. Avoid. [Moderate] Study → Also see **TABLE 9** p. 820
  - **Macrolides (erythromycin)** are predicted to increase the exposure to lapatinib. [Moderate] Study
  - **Netupitant** is predicted to increase the exposure to lapatinib. [Moderate] Study
  - **Nevirapine** is predicted to decrease the exposure to lapatinib. Avoid. [Severe] Study
  - **Nilotinib** is predicted to increase the exposure to lapatinib. [Moderate] Study → Also see **TABLE 9** p. 820
  - **Lapatinib** is predicted to increase the exposure to **nintedanib**. [Moderate] Study
  - **Lapatinib** is predicted to increase the risk of bleeding events when given with **phenindione**. [Severe] Theoretical
  - **Rifampicin** is predicted to decrease the exposure to lapatinib. Avoid. [Severe] Study
  - **St John's Wort** is predicted to decrease the exposure to lapatinib. Avoid. [Severe] Study
  - **Lapatinib** slightly increases the exposure to **taxanes (paclitaxel)**. [Severe] Study
  - **Tudilizumab** is predicted to increase the exposure to lapatinib. Avoid. [Moderate] Theoretical
  - **Lapatinib** is predicted to increase the exposure to **topotecan**. [Severe] Study
Lapatinib – Levodopa

**Interactions**

- **Lapatinib** is predicted to decrease the concentration of **trametinib**. [Moderate] Theoretical
- **Lapatinib** is predicted to increase the exposure to **venetoclax**. Avoid or monitor for toxicity. [Severe] Theoretical

**Laronidase**

- **Antimalarials (chloroquine)** are predicted to decrease the exposure to **laronidase**. Avoid simultaneous administration. [Severe] Theoretical
- **Hydroxycloroquine** is predicted to decrease the exposure to **laronidase**. Avoid simultaneous administration. [Severe] Theoretical

**Ledipasvir**

- **Antacids** are predicted to decrease the exposure to **ledipasvir**. Separate administration by 4 hours. [Moderate] Theoretical
- **Ledipasvir** increases the risk of severe bradyarrhythmias or heart block when given with **antiarrhythmics (amiodarone)**. Refer to specialist literature. [Severe] Anecdotal
- **Antiepileptics (carbamazepine)** are predicted to decrease the exposure to **ledipasvir**. Avoid. [Severe] Theoretical
- **Calcium salts (calcium carbonate)** are predicted to decrease the exposure to **ledipasvir**. Separate administration by 4 hours. [Moderate] Theoretical
- **H₂ receptor antagonists** are predicted to decrease the exposure to **ledipasvir**. Adjust dose, see sofosbuvir with ledipasvir. [Moderate] Study
- **Proton pump inhibitors** are predicted to decrease the exposure to **ledipasvir**. Adjust dose, see sofosbuvir with ledipasvir. [Moderate] Theoretical
- **Rifampicin** is predicted to decrease the exposure to **ledipasvir**. Avoid. [Severe] Theoretical
- **Ledipasvir** moderately increases the exposure to **simeprevir** and **simeprevir** slightly increases the exposure to **ledipasvir**. Avoid. [Severe] Study
- **St John’s Wort** is predicted to decrease the exposure to **ledipasvir**. Avoid. [Severe] Theoretical
- **Ledipasvir** is predicted to increase the exposure to **statins (atorvastatin, simvastatin)**. Monitor and adjust dose. [Moderate] Theoretical
- **Ledipasvir** (with sofosbuvir) is predicted to increase the exposure to **statins (fluvastatin, pravastatin)**. Monitor and adjust dose. [Moderate] Theoretical
- **Ledipasvir** (with sofosbuvir) slightly increases the exposure to **tenofovir**. [Moderate] Study

**Leffunomide** → see **Table 1** p. 818 (hepatotoxicity), **Table 15** p. 821 (myelosuppression)

**Pharmacology**

- **Leffunomide** has a long half-life; washout procedure recommended before switching to other DMARDS (consult product literature).
- **Leffunomide** increases the anticoagulant effect of **coumarin**. [Severe] Anecdotal
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **leffunomide**. Public Health England advises avoid. [Severe] Theoretical

**Lenalidomide**

- → see **Table 1** p. 818 (hepatotoxicity), **Table 15** p. 821 (myelosuppression), **Table 5** p. 818 (thromboembolism)
- **Combined hormonal contraceptives** are predicted to increase the risk of venous thromboembolism when given with **lenalidomide**. Avoid. [Severe] Theoretical
- **Hormone replacement therapy** is predicted to increase the risk of venous thromboembolism when given with **lenalidomide**. [Severe] Theoretical

**Lercanidipine** → see calcium channel blockers

**Levamisole**

- **Food and Lifestyle** Disulfiram-like reaction might occur on consumption of alcohol.
- **Abendazole** slightly decreases the exposure to **levamisole** and **levamisole** moderately decreases the exposure to **abendazole**. [Moderate] Study
- **Levamisole** increases the exposure to **ivermectin**. [Moderate] Study
- **Levetiracetam** → see antiepileptics
- **Levoduolol** → see beta blockers, non-selective
- **Levobupivacaine** → see anaesthetics, local
- **Levocetirizine** → see antihistamines, non-sedating
- **Levodopa** → see **Table 8** p. 819 (hypotension)

**General Information**

- **Amisulpride** is predicted to decrease the effects of **levodopa**. Avoid. [Severe] Theoretical
- **Antiepileptics (foshofenoytin, phenytoin)** decrease the effects of **levodopa**. [Moderate] Study
- **Aripiprazole** is predicted to decrease the effects of **levodopa**. [Severe] Theoretical → Also see **Table 8** p. 819
- **Asenapine** is predicted to decrease the effects of **levodopa**. Adjust dose. [Severe] Theoretical → Also see **Table 8** p. 819
- **Baclofen** is predicted to increase the risk of side-effects when given with **levodopa**. [Severe] Anecdotal → Also see **Table 8** p. 819
- **Benperidol** is predicted to decrease the effects of **levodopa**. [Severe] Study → Also see **Table 8** p. 819
- **Bupropion** increases the risk of side-effects when given with **levodopa**. [Moderate] Study
- **Clozapine** is predicted to decrease the effects of **levodopa**. [Severe] Theoretical → Also see **Table 8** p. 819
- **Droperidol** decreases the effects of **levodopa**. [Severe] Study → Also see **Table 8** p. 819
- **Entacapone** increases the exposure to **levodopa**. Monitor side effects and adjust dose. [Moderate] Study
- **Flupentixol** decreases the effects of **levodopa**. Avoid or monitor worsening parkinsonian symptoms. [Severe] Theoretical → Also see **Table 8** p. 819
- **Haloperidol** decreases the effects of **levodopa**. [Severe] Study → Also see **Table 8** p. 819
- **Iron (oral)** decreases the absorption of **levodopa**. [Moderate] Study
- **Isoniazid** decreases the effects of **levodopa**. [Moderate] Study
- **Levodopa** is predicted to increase the risk of elevated blood pressure when given with **linezolid**. Avoid. [Severe] Theoretical → Also see **Table 8** p. 819
- **Loratadine** is predicted to decrease the effects of **levodopa**. [Severe] Theoretical → Also see **Table 8** p. 819
- **Memantine** is predicted to increase the effects of **levodopa**. [Moderate] Theoretical
- **Metoclopramide** decreases the effects of **levodopa**. Avoid. [Moderate] Study
- **Levodopa** increases the risk of side-effects when given with **moclobemide**. [Moderate] Study
- **Levodopa** increases the risk of a hypertensive crisis when given with **monoamine-oxidase A and B inhibitors, irreversible**. Avoid and for 14 days after stopping the MAOI. [Severe] Study → Also see **Table 8** p. 819
- **Monoamine-oxidase B inhibitors** are predicted to increase the effects of **levodopa**. Adjust dose. [Moderate] Study → Also see **Table 8** p. 819
- **Olanzapine** decreases the effects of **levodopa**. Avoid or monitor worsening parkinsonian symptoms. [Severe] Anecdotal → Also see **Table 8** p. 819
- **Opicapone** increases the exposure to **levodopa**. Adjust **levodopa** dose. [Moderate] Study
- **Paliperidone** is predicted to decrease the effects of **levodopa**. [Severe] Theoretical → Also see **Table 8** p. 819
- **Phenothiazines** decrease the effects of **levodopa**. Avoid or monitor worsening parkinsonian symptoms. [Severe] Study → Also see **Table 8** p. 819
- **Pimozide** decreases the effects of **levodopa**. [Severe] Theoretical → Also see **Table 8** p. 819
- **Quetiapine** decreases the effects of **levodopa**. [Severe] Anecdotal → Also see **Table 8** p. 819
- **Risperidone** is predicted to decrease the effects of **levodopa**. Avoid or adjust dose. [Severe] Anecdotal → Also see **Table 8** p. 819
- **Sulpiride** is predicted to decrease the effects of **levodopa**. Avoid. [Severe] Theoretical → Also see **Table 8** p. 819
- **Tetramizine** is predicted to decrease the effects of **levodopa**. Use with caution or avoid. [Moderate] Theoretical
Tolcapone increases the exposure to levodopa. Monitor and adjust dose. [Moderate] Study

Zuclopenthixol is predicted to decrease the effects of levodopa. Avoid or monitor worsening parkinsonian symptoms. [Severe] Theoretical → Also see TABLE 8 p. 819

Levofoflaxacin → see quinolones

Levolofolic acid → see folates

Levomepromazine → see phenothiazines

Levonorgradol

Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of levonorgradol. For FSRH guidance, see Contraceptives, Interactions p. 474. [Severe] Theoretical

Aprepitant is predicted to decrease the efficacy of levonorgradol. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical

Bosentan is predicted to decrease the efficacy of levonorgradol. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical

Efavirenz is predicted to decrease the efficacy of levonorgradol. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical

Fosaprepitant is predicted to decrease the efficacy of levonorgradol. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical

Griseofulvin potentially decreases the efficacy of oral levonorgradol. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Anecdotal

HIV-protease inhibitors (ritonavir) are predicted to decrease the efficacy of levonorgradol. For FSRH guidance, see Contraceptives, Interactions p. 474. [Severe] Theoretical

Modafinil is predicted to decrease the efficacy of levonorgradol. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical

Nevirapine is predicted to decrease the efficacy of levonorgradol. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical

Rifabutin is predicted to decrease the efficacy of levonorgradol. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical

Rifampicin is predicted to decrease the efficacy of levonorgradol. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical

St John’s Wort is predicted to decrease the efficacy of levonorgradol. MHRA advises avoid. For FSRH guidance, see Contraceptives, Interactions p. 474. [Severe] Theoretical

Sugammadex is predicted to decrease the exposure to levonorgradol. Use additional contraceptive precautions. [Severe] Theoretical

Ulipristal is predicted to decrease the efficacy of levonorgradol. Avoid. [Severe] Theoretical

Levotironzone

Antacids are predicted to decrease the absorption of levotironzone. Separate administration by at least 4 hours. [Moderate] Anecdotal

Antiarrhythmics (amiodarone) increase the risk of thyroid dysfunction when given with levotironzone. Avoid. [Moderate] Study

Antiepileptics (carbamazepine) increase the risk of hypothyroidism when given with levotironzone. Monitor and adjust dose. [Moderate] Study

Antiepileptics (fosphenytoin, phenytoin) increase the risk of hypothyroidism when given with levotironzone. [Moderate] Study

Antiepileptics (phenoobarbital, primidone) are predicted to decrease the effects of levotironzone. [Moderate] Theoretical

Oral calcium salts are predicted to decrease the absorption of levotironzone. Separate administration by at least 4 hours. [Moderate] Anecdotal

Levotironzone is predicted to affect the concentration of digoxin. Monitor and adjust dose. [Moderate] Theoretical

Oral Hormone replacement therapy is predicted to decrease the effects of levotironzone. [Moderate] Theoretical

Iron (oral) decreases the absorption of levotironzone. Separate administration by at least 4 hours. [Moderate] Study

Lanthanum decreases the absorption of levotironzone. Separate administration by 2 hours. [Moderate] Study

Polystyrene sulfonate is predicted to decrease the absorption of levotironzone. Separate administration by at least 4 hours. [Moderate] Theoretical

Sucralfate decreases the absorption of levotironzone. Separate administration by at least 4 hours. [Moderate] Study

Lidocaine → see antiarrhythmics

Linagliptin → see TABLE 14 p. 821 (antidiabetic drugs)

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to linagliptin. [Moderate] Study

Enalaprilam is predicted to decrease the exposure to linagliptin. [Moderate] Study

Linagliptin is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical

Rifampicin is predicted to decrease the exposure to linagliptin. [Moderate] Study

Linzolid → see TABLE 15 p. 821 (myelosuppression), TABLE 13 p. 821 (serotonine syndrome)

FOOD AND LIFESTYLE Patients taking linezolid should avoid consuming large amounts of tyramine-rich foods (such as mature cheese, salami, pickled herring, Bovril®, Oxo®, Marmite® or any similar meat or yeast extract or fermented soya bean extract, and some beers, lagers or wines).

Beta: agonists are predicted to increase the risk of elevated blood pressure when given with linezolid. Avoid. [Severe] Theoretical

Bupropion is predicted to increase the risk of intraoperative hypotension when given with linezolid. [Severe] Anecdotal → Also see TABLE 13 p. 821

Buspirone is predicted to increase the risk of elevated blood pressure when given with linezolid. Avoid. [Severe] Theoretical → Also see TABLE 13 p. 821

Levodopa is predicted to increase the risk of elevated blood pressure when given with linezolid. Avoid. [Severe] Theoretical

Methylphenidate is predicted to increase the risk of elevated blood pressure when given with linezolid. Avoid. [Severe] Theoretical

Moclobemide is predicted to increase the risk of side-effects when given with linezolid. Avoid and for 14 days after stopping moclobemide. [Severe] Theoretical → Also see TABLE 13 p. 821

Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the risk of side-effects when given with linezolid. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 13 p. 821

Monoamine-oxidase B inhibitors (rasagline, selegiline) are predicted to increase the risk of side-effects when given with linezolid. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 13 p. 821

Monoamine-oxidase B inhibitors (safinamide) are predicted to increase the risk of side-effects when given with linezolid. Avoid and for 1 week after stopping safinamide. [Severe] Theoretical → Also see TABLE 13 p. 821

Reboxetine is predicted to increase the risk of a hypertensive crisis when given with linezolid. Avoid. [Severe] Theoretical

Symptomamotomists, isotropic (dobutamine, dopamine) are predicted to increase the risk of elevated blood pressure when given with linezolid. Avoid. [Severe] Theoretical

Symptomamotomists, vasoconstritor (adrenaline/epinephrine, ephedrine, isomethepine, noradreneline/norepinephrine, phenylephrine) are predicted to increase the risk of elevated blood pressure when given with linezolid. Avoid. [Severe] Theoretical

Symptomamotomists, vasoconstritor (pseudoephedrine) increase the risk of elevated blood pressure when given with linezolid. Avoid. [Severe] Study

Liathyrzone

Antiarrhythmics (amiodarone) are predicted to increase the risk of thyroid dysfunction when given with liathyrzone. Avoid. [Moderate] Theoretical
Antiepileptics (fosphenytoin, phenytoin) are predicted to increase the risk of hypothyroidism when given with lithium. [Moderate] Theoretical

Antiepileptics (phenobarbital, primidone) are predicted to decrease the effects of lithium. [Moderate] Theoretical

Lithium increases the risk of neurotoxicity. Monitor and adjust dose. [Moderate] Theoretical

Oral hormone replacement therapy is predicted to decrease the concentration of calcitonin (salmon). [Moderate] Study

Lanthanum increases the absorption of lithium carbonate, lithium citrate. [Anecdotal] Study

ACE inhibitors are predicted to increase the concentration of lithium. Monitor and adjust dose. [Severe] Anecdotal

Acetazolamide alters the concentration of lithium. [Severe] Anecdotal

Aldosterone antagonists (eplerenone) are predicted to increase the concentration of lithium. [Avoid] [Moderate] Theoretical

Aldosterone antagonists (spironolactone) potentially increase the concentration of lithium. [Severe] Study

Aminophylline is predicted to decrease the concentration of lithium. Monitor concentration and adjust dose. [Severe] Anecdotal

Antiepileptics (carbamazepine) increase the risk of neurotoxicity when given with lithium. [Severe] Anecdotal

Antiepileptics (oxcarbazepine) are predicted to increase the risk of neurotoxicity when given with lithium. [Severe] Theoretical

Calcitonin (salmon) decreases the concentration of lithium. [Severe] Study

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the risk of neurotoxicity when given with lithium. [Severe] Anecdotal

Loop diuretics increase the concentration of lithium. Monitor and adjust dose. [Severe] Study

NSAIDs increase the concentration of lithium. Monitor and adjust lithium (lithium carbonate, lithium citrate) dose. [Severe] Study

Phenothiazines potentially increase the risk of neurotoxicity when given with lithium. [Severe] Anecdotal → Also see TABLE 9 p. 820

Potassium-sparing diuretics (triamterene) potentially increase the clearance of lithium. [Moderate] Study

Quetiapine potentially increases the risk of neurotoxicity when given with lithium. [Severe] Anecdotal

Risperidone potentially increases the risk of neurotoxicity when given with lithium. [Severe] Anecdotal → Also see TABLE 9 p. 820

Sodium bicarbonate decreases the concentration of lithium. [Severe] Anecdotal

Sulpiride potentially increases the risk of neurotoxicity when given with lithium. [Severe] Anecdotal → Also see TABLE 9 p. 820

Theophylline is predicted to decrease the concentration of lithium. [Severe] Anecdotal

Thiazide diuretics increase the concentration of lithium. Avoid or adjust lithium (lithium carbonate, lithium citrate) dose and monitor lithium (lithium carbonate, lithium citrate) concentration. [Severe] Study

Tricyclic antidepressants potentially increase the risk of neurotoxicity when given with lithium. [Severe] Anecdotal → Also see TABLE 9 p. 820 → Also see TABLE 13 p. 821

Zuclopenthixol potentially increases the risk of neurotoxicity when given with lithium. [Severe] Anecdotal → Also see TABLE 9 p. 820

### Live vaccines

Bacillus Calmette-Guérin vaccine - influenza vaccine - measles, mumps and rubella vaccine, live - rotavirus vaccine - typhoid vaccine - varicella-zoster vaccine - yellow fever vaccine, live

**ROUTE-SPECIFIC INFORMATION** Oral typhoid vaccine is inactivated by concurrent administration of antibiotics or antimarialarials: antibiotics should be avoided for 3 days before and after oral typhoid vaccination; mefloquine should be avoided for at least 12 hours before or after oral typhoid vaccination; for other antimarialarials oral typhoid vaccine vaccination should be completed at least 3 days before the first dose of the antimarialarial (except proguanil hydrochloride with atovaquone, which can be given concurrently).

- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with abatacept. Public Health England advises avoid. [Severe] Theoretical
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with alkylating agents. Public Health England advises avoid. [Severe] Theoretical
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with anthracyclines. Public Health England advises avoid. [Severe] Theoretical
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with amniscaine. Public Health England advises avoid. [Severe] Theoretical
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with belatacept. Public Health England advises avoid. [Severe] Theoretical
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with belotuzumab. Public Health England advises avoid. [Severe] Theoretical
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with bevacizumab. Public Health England advises avoid. [Severe] Theoretical
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with capecitabine. Public Health England advises avoid. [Severe] Theoretical
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with capecitabine. Public Health England advises avoid. [Severe] Theoretical
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with cladribine. Public Health England advises avoid. [Severe] Theoretical
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with cladribine. Public Health England advises avoid. [Severe] Theoretical
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with cladribine. Public Health England advises avoid. [Severe] Theoretical
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with cladribine. Public Health England advises avoid. [Severe] Theoretical
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with cytarabine. Public Health England advises avoid. [Severe] Theoretical
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with cytarabine. Public Health England advises avoid. [Severe] Theoretical
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with
Live vaccines — Lomitapide 913

**dactinomycin.** Public Health England advises avoid. **Severe**

- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **dimethyl fumarate.** Public Health England advises avoid. **Severe**
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **etanercept.** Public Health England advises avoid. **Severe**
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **everolimus.** Public Health England advises avoid. **Severe**
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **fingolimod.** Public Health England advises avoid. **Severe**
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **gemcitabine.** Public Health England advises avoid. **Severe**
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **hydroxyurea.** Public Health England advises avoid. **Severe**
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **irinotecan.** Public Health England advises avoid. **Severe**
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **irinotecan.** Public Health England advises avoid. **Severe**
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **mercaptopurine.** Public Health England advises avoid. **Severe**
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **methotrexate.** Public Health England advises avoid. **Severe**
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **mitomycin.** Public Health England advises avoid. **Severe**
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **monoclonal antibodies.** Public Health England advises avoid. **Severe**
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **mycophenolate.** Public Health England advises avoid. **Severe**
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **pemetrexed.** Public Health England advises avoid. **Severe**
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **platinum compounds.** Public Health England advises avoid. **Severe**
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **procarrabazine.** Public Health England advises avoid. **Severe**
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **ralitrexed.** Public Health England advises avoid. **Severe**
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **sirolimus.** Public Health England advises avoid. **Severe**
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **taurolix.** Public Health England advises avoid. **Severe**
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **taxanes (docetaxel, paclitaxel).** Public Health England advises avoid. **Severe**
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **tegafur.** Public Health England advises avoid. **Severe**
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **temsirolimus.** Public Health England advises avoid. **Severe**
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **tioguanine.** Public Health England advises avoid. **Severe**
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **topotecan.** Public Health England advises avoid. **Severe**
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **trabectedin.** Public Health England advises avoid. **Severe**
- **Live vaccines** are predicted to decrease the exposure to **lomitapide; separate administration by 12 hours.**

**Table 14**

**Separation of Administration** Some orally administered drugs should be taken at least 1 hour before, or 4 hours after, lixisenatide injection.

- **Lofepramine** → see tricyclic antidepressants
- **Lofexidine** → see Table 8 p. 819 (hypotension), Table 9 p. 820 (QT-interval prolongation), Table 11 p. 820 (CNS depressant effects)

**Lomitapide** → see Table 1 p. 818 (hepatotoxicity)

**FOOD AND LIFESTYLE** Bitter (Seville) orange is predicted to increase the exposure to lomitapide; separate administration by 12 hours.

- **Alprazolam** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. **Moderate**
- **Antiarhythmics (amiodarone)** are predicted to increase the exposure to lomitapide. Separate administration by 12 hours. **Moderate**
- **Antiarhythmics (dronedarone)** are predicted to increase the exposure to lomitapide. Avoid. **Moderate**
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to lomitapide. Monitor and adjust dose. **Moderate**
- Also see Table 1 p. 818
Lomitapide (continued)

- Antiarrhythmics (dronedarone) are predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical
- Antiarrhythmics (amiodarone, ibutilide) are predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical
- Calcium channel blockers (amlodipine, diltiazem, verapamil) are predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical
- Ciclosporin is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical
- Clopidogrel is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical
- Fosaprepitant is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical
- Idelalisib is predicted to markedly increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical
- Lomitapide increases the exposure to coumarins (warfarin). Monitor INR and adjust warfarin dose. [Severe] Study
- Crizotinib is predicted to increase the exposure to lomitapide. Avoid. [Moderate] Theoretical
- Enalaprilat is predicted to decrease the exposure to lomitapide. Monitor and adjust dose. [Moderate] Theoretical
- Everolimus is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical
- Fosaprepitant is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical
- Grapefruit juice is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical
- H₂ receptor antagonists (cimetidine, ranitidine) are predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to markedly increase the exposure to lomitapide. Avoid. [Severe] Study
- HIV-protease inhibitors (indinavir) are predicted to increase the exposure to lomitapide. Avoid. [Moderate] Theoretical
- Idealalisib is predicted to markedly increase the exposure to lomitapide. Avoid. [Severe] Study
- Isoniazid is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical
- Itraconazole (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) increases the exposure to lomitapide. Avoid. [Severe] Study
- Lopinavir
- Lopinavir is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical
- Lopivirone is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical
- Lumacaftor is predicted to affect the exposure to lopinavir. [Moderate] Theoretical
- Mirabegron is predicted to increase the exposure to lopinavir. [Mild] Theoretical
- Velpatasvir is predicted to increase the exposure to lopinavir. [Severe] Theoretical
- Lopinavir → see HIV-protease inhibitors
Loprazolam → see TABLE 11 p. 820 (CNS depressant effects)
Loratadine → see antihistamines, non-sedating
Lorazepam → see TABLE 11 p. 820 (CNS depressant effects)
  ▶ Rifampicin increases the clearance of lorazepam. (Moderate) Study
Lormetazepam → see TABLE 11 p. 820 (CNS depressant effects)
Losartan → see angiotensin-II receptor antagonists
Low molecular-weight heparins → see TABLE 16 p. 822 (increased serum potassium), TABLE 3 p. 818 (anticoagulant effects)

dalteparin - enoxaparin - tinzaparin
  ▶ Ranibizumab increases the risk of bleeding events when given with low molecular-weight heparins. (Severe) Theoretical
Loxapine → see TABLE 8 p. 819 (hypotension), TABLE 11 p. 820 (CNS depressant effects), TABLE 10 p. 820 (anomuscarinics)
  ▶ Combined hormonal contraceptives are predicted to increase the exposure to loxapine. Avoid. (Unknown) Theoretical
  ▶ Loxapine is predicted to decrease the effects of dopamine receptor agonists. (Moderate) Theoretical → Also see TABLE 8 p. 819 → Also see TABLE 10 p. 820
  ▶ Loxapine is predicted to decrease the clearance of levodopa. (Severe) Theoretical → Also see TABLE 8 p. 819
  ▶ Quinolones (ciprofloxacin) are predicted to increase the exposure to loxapine. Avoid. (Unknown) Theoretical
  ▶ SSRIs (fluvoxamine) are predicted to increase the exposure to loxapine. Avoid. (Unknown) Theoretical
Lumacaftor
  ▶ Lumacaftor is predicted to affect the exposure to aliskiren. (Moderate) Theoretical
  ▶ Lumacaftor is predicted to decrease the exposure to antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone). Avoid. (Severe) Theoretical
  ▶ Lumacaftor is predicted to decrease the exposure to antifungals, azoles (fluconazole). Adjust dose. (Mild) Theoretical
  ▶ Lumacaftor is predicted to decrease the exposure to antifungals, azoles (itraconazole, ketoconazole, voriconazole). (Moderate) Theoretical
  ▶ Lumacaftor is predicted to decrease the exposure to antifungals, azoles (posaconazole). Avoid. (Moderate) Theoretical
  ▶ Lumacaftor is predicted to affect the exposure to antihistamines, non-sedating (fexofenadine). Monitor and adjust dose. (Moderate) Theoretical
  ▶ Lumacaftor is predicted to decrease the exposure to bupropion. Adjust dose. (Moderate) Theoretical
  ▶ Lumacaftor is predicted to decrease the exposure to ciclosporin. Avoid. (Severe) Theoretical
  ▶ Lumacaftor is predicted to affect the exposure to colchicine. (Moderate) Theoretical
  ▶ Lumacaftor is predicted to decrease the efficacy of combined hormonal contraceptives. Use additional contraceptive precautions. (Severe) Theoretical
  ▶ Lumacaftor is predicted to decrease the exposure to corticosteroids (methylprednisolone, prednisone). Adjust dose. (Severe) Theoretical
  ▶ Lumacaftor is predicted to affect the exposure to coumarins (warfarin). (Severe) Theoretical
  ▶ Lumacaftor is predicted to affect the exposure to dabigatran. Monitor and adjust dose. (Moderate) Theoretical
  ▶ Lumacaftor is predicted to affect the exposure to digoxin. Monitor and adjust dose. (Moderate) Theoretical
  ▶ Lumacaftor is predicted to affect the exposure to edoxaban. (Moderate) Theoretical
  ▶ Lumacaftor is predicted to decrease the exposure to everolimus. Avoid. (Severe) Theoretical
  ▶ Lumacaftor is predicted to affect the exposure to H<sub>2</sub> receptor antagonists (ranitidine). Monitor and adjust dose. (Moderate) Theoretical
  ▶ Lumacaftor is predicted to affect the exposure to loperamide. (Moderate) Theoretical
  ▶ Lumacaftor is predicted to decrease the exposure to macrolides (clarithromycin, erythromycin). (Moderate) Theoretical
  ▶ Lumacaftor is predicted to decrease the exposure to midazolam. Avoid. (Severe) Theoretical
  ▶ Lumacaftor is predicted to decrease the exposure to montelukast. (Moderate) Theoretical
  ▶ Lumacaftor is predicted to decrease the exposure to NSAIDs (ibuprofen). Adjust dose. (Moderate) Theoretical
  ▶ Lumacaftor is predicted to decrease the exposure to proton pump inhibitors (esomeprazole, lansoprazole, omeprazole). Adjust dose. (Moderate) Theoretical
  ▶ Lumacaftor is predicted to decrease the exposure to repaglinide. Adjust dose. (Moderate) Theoretical
  ▶ Lumacaftor is predicted to decrease the exposure to rifabutin. Adjust dose. (Moderate) Theoretical
  ▶ Lumacaftor is predicted to decrease the exposure to sirolimus. Avoid. (Severe) Theoretical
  ▶ Lumacaftor is predicted to decrease the exposure to SSRI (citalopram, escitalopram, sertraline). Adjust dose. (Moderate) Theoretical
  ▶ Lumacaftor is predicted to affect the exposure to taxanes (paclitaxel). (Moderate) Theoretical
  ▶ Lumacaftor is predicted to decrease the exposure to temsirolimus. (Severe) Theoretical
  ▶ Lumacaftor is predicted to affect the exposure to topotecan. (Moderate) Theoretical
Lumefantrine → see antimalarials
Lurasidone → see TABLE 8 p. 819 (hypotension), TABLE 11 p. 820 (CNS depressant effects)
  ▶ Antiarrhythmics (dronedarone) are predicted to increase the exposure to lurasidone. (Moderate) Study
  ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to lurasidone. Avoid. (Moderate) Study → Also see TABLE 11 p. 820
  ▶ Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to lurasidone. (Moderate) Study
  ▶ Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to lurasidone. Avoid. (Severe) Study
  ▶ Aprepitant is predicted to increase the exposure to lurasidone. (Moderate) Study
  ▶ Bosentan is predicted to decrease the exposure to lurasidone. Monitor and adjust dose. (Moderate) Theoretical
  ▶ Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to lurasidone. (Moderate) Study → Also see TABLE 8 p. 819
  ▶ Cobicistat is predicted to increase the exposure to lurasidone. Avoid. (Severe) Study
  ▶ Crizotinib is predicted to increase the exposure to lurasidone. (Moderate) Study
  ▶ Efavirenz is predicted to decrease the exposure to lurasidone. Monitor and adjust dose. (Moderate) Theoretical
  ▶ Enzalutamide is predicted to decrease the exposure to lurasidone. Avoid. (Moderate) Study
  ▶ Grapefruit juice is predicted to increase the exposure to lurasidone. Avoid. (Severe) Theoretical
  ▶ HIV-protase inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to lurasidone. Avoid. (Severe) Study
  ▶ HIV-protase inhibitors (indinavir) are predicted to increase the exposure to lurasidone. (Moderate) Study
  ▶ Idelalisib is predicted to increase the exposure to lurasidone. Avoid. (Severe) Study
  ▶ Imatinib is predicted to increase the exposure to lurasidone. (Moderate) Study
  ▶ Lurasidone is predicted to decrease the effects of levodopa. (Severe) Theoretical → Also see TABLE 8 p. 819
  ▶ Macrolides (clarithromycin) are predicted to increase the exposure to lurasidone. Avoid. (Severe) Study
  ▶ Macrolides (erythromycin) are predicted to increase the exposure to lurasidone. (Moderate) Study
  ▶ Nevirapine is predicted to increase the exposure to lurasidone. Monitor and adjust dose. (Moderate) Theoretical
  ▶ Nilotinib is predicted to increase the exposure to lurasidone. (Moderate) Study
**Lurasidone**

- **Rifampicin** is predicted to decrease the exposure to lurasidone. Avoid. [Moderate] Study
- **St John’s Wort** is predicted to decrease the exposure to lurasidone. Monitor and adjust dose. [Moderate] Theoretical

**Lyme disease**

- see tetracyclines

**Macitentan**

- Antipeptidase (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to macitentan. Avoid. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to decrease the exposure to macitentan. [Moderate] Study
- **Cobicistat** is predicted to increase the exposure to macitentan. [Moderate] Study
- **Enalaprilat** is predicted to decrease the exposure to macitentan. Avoid. [Severe] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to macitentan. [Moderate] Study
- **St John’s Wort** is predicted to decrease the exposure to macitentan. Avoid. [Severe] Study
- **Macrolides** (clarithromycin) are predicted to increase the exposure to macitentan. [Moderate] Study
- **Macrolides** (erythromycin) are predicted to increase the exposure to macitentan. [Moderate] Study
- **St John’s Wort** is predicted to decrease the exposure to macitentan. Avoid. [Severe] Study

**TABLE 9 p. 820** (QT-interval prolongation)

**ROUTE-SPECIFIC INFORMATION**

Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

- **Clarithromycin** is predicted to increase the exposure to abiraterone. [Severe] Theoretical
- **Macrolides** (clarithromycin, erythromycin) are predicted to increase the exposure to abiraterone. Separate administration by 12 hours. [Moderate] Study
- **Clarithromycin** is predicted to markedly increase the exposure to aldosterone antagonists (eplerenone). Avoid. [Severe] Study
- **Erythromycin** is predicted to increase the exposure to aldosterone antagonists (eplerenone). Adjust eplerenone dose. [Severe] Study
- **Aclidomycin** is predicted to increase the exposure to aliskiren. [Moderate] Theoretical
- **Macrolides** (clarithromycin, erythromycin) are predicted to increase the exposure to aliskiren. [Moderate] Study
- **Clarithromycin** increases the exposure to almotriptan. [Mild] Study
- **Clarithromycin** is predicted to moderately increase the exposure to alpha blockers (alfuzosin, tamsulosin). Use with caution or avoid. [Moderate] Study
- **Clarithromycin** is predicted to increase the exposure to alpha blockers (doxazosin). [Moderate] Study
- **Erythromycin** is predicted to increase the exposure to alpha blockers (tamsulosin). [Moderate] Theoretical
- **Clarithromycin** moderately increases the exposure to alprazolam. Avoid. [Moderate] Study
- **Erythromycin** is predicted to increase the exposure to alprazolam. [Severe] Study
- **Azithromycin** is predicted to increase the exposure to aminophylline. [Moderate] Theoretical
- **Clarithromycin** is predicted to increase the exposure to aminophylline. Adjust aminophylline dose, p. 161. [Moderate] Theoretical
- **Aminophylline** is predicted to decrease the exposure to erythromycin. Adjust dose. [Severe] Study
- **Clarithromycin** very markedly increases the exposure to antiarrhythmics (dronedarone). Avoid. [Severe] Study
- **Erythromycin** is predicted to moderately increase the exposure to antiarrhythmics (dronedarone). Avoid. [Severe] Theoretical
- **Macrolides** (clarithromycin, erythromycin) are predicted to increase the exposure to antiarrhythmics (lidocaine). [Moderate] Theoretical

- **Clarithromycin** is predicted to increase the exposure to antiarrhythmics (propafenone). Monitor and adjust dose. [Severe] Study
- **Erythromycin** is predicted to increase the exposure to antiarrhythmics (propafenone). Monitor and adjust dose. [Moderate] Study
- **Clarithromycin** is predicted to increase the exposure to anticholinesterases, centrally acting (galantamine). Monitor and adjust dose. [Moderate] Study
- **Clarithromycin** slightly increases the concentration of antipeptidase (carbamazepine). Monitor carbamazepine concentration and adjust dose. [Severe] Study
- **Erythromycin** markedly increases the concentration of antipeptidase (carbamazepine). Monitor carbamazepine concentration and adjust dose. [Severe] Study
- **Clarithromycin** is predicted to slightly increase the exposure to antipeptidase (perampanel). [Mild] Study
- **Clarithromycin** is predicted to increase the exposure to antifungals, azoles (isavuconazole). Avoid or monitor side effects. [Severe] Study
- **Erythromycin** is predicted to increase the exposure to antifungals, azoles (isavuconazole). [Moderate] Theoretical
- **Clarithromycin** is predicted to increase the exposure to antihistamines, non-sedating (mizolastine). Avoid. [Severe] Study
- **Erythromycin** is predicted to increase the exposure to antihistamines, non-sedating (mizolastine). [Severe] Theoretical
- **Clarithromycin** is predicted to increase the exposure to antimalarials (artemether) with lumefantrine. [Moderate] Study

- **Macrolides** (clarithromycin, erythromycin) are predicted to increase the concentration of antimalarials (piperaquine). [Severe] Theoretical
- **Clarithromycin** is predicted to increase the exposure to apixaban. Avoid. [Severe] Theoretical
- **Erythromycin** is predicted to increase the exposure to apixaban. [Moderate] Theoretical
- **Clarithromycin** is predicted to markedly increase the exposure to aprepitant. [Moderate] Study
- **Clarithromycin** is predicted to slightly increase the exposure to arripiprazole. Adjust arripiprazole dose. p. 240. [Moderate] Study
- **Clarithromycin** is predicted to increase the exposure to azithromycin. Avoid or adjust dose. [Moderate] Study
- **Erythromycin** is predicted to increase the exposure to azithromycin. [Moderate] Theoretical
- **Clarithromycin** is predicted to increase the exposure to bedaquiline. Avoid prolongued use. [Mild] Study
- **Erythromycin** is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical
- **Macrolides** are predicted to increase the exposure to beta blockers, non-selective (nadolol). [Moderate] Study
- **Clarithromycin** is predicted to increase the exposure to beta blockers (amiodarone). Monitor and adjust dose. [Moderate] Study
- **Clarithromycin** slightly increases the exposure to bortezomib. [Moderate] Study
- **Clarithromycin** is predicted to increase the exposure to bosentan. [Moderate] Theoretical
- **Clarithromycin** is predicted to markedly increase the exposure to bosutinib. Avoid or adjust bosutinib dose. [Severe] Study
- **Erythromycin** is predicted to increase the exposure to bosutinib. Avoid or adjust bosutinib dose. [Severe] Theoretical
- **Clarithromycin** is predicted to increase the exposure to buspirone. Adjust buspirone dose. [Severe] Study
- **Erythromycin** is predicted to increase the exposure to buspirone. Use with caution and adjust dose. [Moderate] Study
- **Clarithromycin** slightly increases the exposure to cabozantinib. [Moderate] Study
- **Clarithromycin** is predicted to increase the exposure to cabozantinib. [Moderate] Theoretical
- **Macrolides** (clarithromycin, erythromycin) are predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study
Macrolides – Macrolides 917

- **Erythromycin** is predicted to increase the exposure to calcium channel blockers (diltiazem). **Severe** Theoretical
- **Clarithromycin** is predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). **Severe** Study
- **Clarithromycin** is predicted to markedly increase the exposure to calcium channel blockers (lercanidipine). Avoid. **Severe** Study
- **Erythromycin** is predicted to increase the exposure to calcium channel blockers (verapamil). **Severe** Study
- **Clarithromycin** is predicted to increase the exposure to cannabis extract. Use with caution and adjust dose. **Moderate** Theoretical
- **Clarithromycin** is predicted to increase the exposure to ceritinib. Avoid or adjust ceritinib dose. **Severe** Study → Also see TABLE 9 p. 820
- **Macrolides (azithromycin, erythromycin)** are predicted to increase the exposure to ceritinib. **Moderate** Theoretical
- **Macrolides (clarithromycin, erythromycin)** increase the concentration of ciclosporin. **Severe** Study
- **Clarithromycin** is predicted to moderately increase the exposure to cilostazol. Adjust cilostazol dose. **Moderate** Study
- **Erythromycin** slightly increases the exposure to cilostazol. Adjust cilostazol dose. **Moderate** Study
- **Clarithromycin** is predicted to moderately increase the exposure to cinacalcet. Adjust dose. **Moderate** Study
- **Clarithromycin** is predicted to markedly increase the exposure to clarithromycin. Avoid or monitor for toxicity. **Severe** Study
- **Erythromycin** is predicted to increase the exposure to clarithromycin. **Severe** Theoretical
- **Azithromycin** is predicted to increase the exposure to colchicine. Avoid or adjust colchicine dose. **Severe** Theoretical
- **Clarithromycin** is predicted to increase the exposure to colchicine. Avoid or adjust colchicine dose. **Severe** Study
- **Erythromycin** is predicted to increase the exposure to corticosteroids (budesonide). **Severe** Study
- **Clarithromycin** is predicted to increase the exposure to corticosteroids (ciclesonide). Avoid. **Moderate** Theoretical
- **Clarithromycin** is predicted to increase the exposure to corticosteroids (dexamethasone, methylprednisolone). Monitor and adjust dose. **Moderate** Study
- **Clarithromycin** is predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. **Moderate** Study
- **Clarithromycin** is predicted to increase the exposure to corticosteroids (mometasone). **Moderate** Theoretical
- **Clarithromycin** is predicted to increase the risk of side-effects when given with corticosteroids (triamcinolone). **Severe** Theoretical
- **Macrolides (clarithromycin, erythromycin)** increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. **Severe** Anecdotal
- **Clarithromycin** is predicted to moderately increase the exposure to crizotinib. Avoid. **Moderate** Study → Also see TABLE 9 p. 820
- **Erythromycin** is predicted to increase the exposure to crizotinib. **Moderate** Theoretical
- **Macrolides (azithromycin, clarithromycin, erythromycin)** are predicted to increase the exposure to dabigatran. **Moderate** Theoretical
- **Clarithromycin** is predicted to increase the exposure to dabrafenib. Use with caution or avoid. **Moderate** Study
- **Clarithromycin** is predicted to moderately increase the exposure to daclatasvir. Adjust daclatasvir dose. **Moderate** Study
- **Clarithromycin** is predicted to markedly increase the exposure to darbepoetin. **Severe** Study
- **Clarithromycin** is predicted to markedly increase the exposure to dasatinib. Avoid. **Severe** Study → Also see TABLE 9 p. 820
- **Erythromycin** is predicted to increase the exposure to dasatinib. **Severe** Study
- **Clarithromycin** very slightly increases the exposure to delamanid. **Severe** Study → Also see TABLE 9 p. 820
- **Macrolides** increase the concentration of digitoxin. **Severe** Anecdotal
- **Macrolides (clarithromycin, erythromycin)** increase the risk of QT-prolongation when given with domperidone. Avoid. **Severe** Study
- **Clarithromycin** increases the exposure to dopamine receptor agonists (bromocriptine, cabergoline). **Severe** Study
- **Erythromycin** is predicted to increase the exposure to dopamine receptor agonists (bromocriptine, cabergoline). **Severe** Theoretical
- **Clarithromycin** is predicted to increase the exposure to dutasteride. **Moderate** Study
- **Erythromycin** is predicted to moderately increase the exposure to dutasteride. **MiD** Study
- **Erythromycin** slightly increases the exposure to edoxaban. Adjust edoxaban dose. **Severe** Study
- **Macrolides (azithromycin, clarithromycin)** are predicted to slightly increase the exposure to edoxaban. **Severe** Theoretical Study
- **Efavirenz** decreases the exposure to clarithromycin. **Moderate** Study
- **Clarithromycin** slightly to moderately increases the exposure to elbavir. Avoid. **Moderate** Study
- **Clarithromycin** is predicted to markedly increase the exposure to eltetrapan. Avoid. **Severe** Study
- **Erythromycin** moderately increases the exposure to eltetrapan. Avoid. **Moderate** Study
- **Clarithromycin** is predicted to increase the risk of ergotism when given with ergometrine. Avoid. **Severe** Theoretical
- **Erythromycin** is predicted to increase the risk of ergotism when given with ergometrine. **Severe** Theoretical
- **Clarithromycin** is predicted to increase the risk of ergotism when given with ergotamine. Avoid. **Severe** Theoretical
- **Erythromycin** is predicted to increase the risk of ergotism when given with ergotamine. **Severe** Theoretical
- **Clarithromycin** is predicted to slightly increase the exposure to erlotinib. Use with caution and adjust dose. **Moderate** Study
- **Macrolides (azithromycin, erythromycin)** are predicted to increase the exposure to erlotinib. **Moderate** Theoretical
- **Etravirine** decreases the exposure to clarithromycin. **Severe** Study
- **Clarithromycin** is predicted to increase the concentration of everolimus. Avoid. **Severe** Study
- **Erythromycin** is predicted to increase the concentration of everolimus. Avoid or adjust dose. **Moderate** Study
- **Clarithromycin** is predicted to moderately increase the exposure to fosoterodine. Adjust fosoterodine dose; avoid in hepatic and renal impairment. **Severe** Study
- **Erythromycin** is predicted to increase the exposure to fosoterodine. Adjust fosoterodine dose in hepatic and renal impairment. **MiD** Study
- **Macrolides are predicted to increase the exposure to fidaxomicin. Avoid. **Moderate** Study
- **Clarithromycin** is predicted to increase the exposure to fosaprepitant. **Moderate** Theoretical
- **Clarithromycin** is predicted to increase the exposure to gefitinib. **Moderate** Study
- **Erythromycin** is predicted to increase the exposure to gefitinib. **Moderate** Study
- **Clarithromycin** is predicted to moderately increase the exposure to gefitinib. **Moderate** Theoretical
- **Clarithromycin** is predicted to moderate to markedly increase the exposure to grazoprevir. Avoid. **Severe** Study
- **Clarithromycin** is predicted to increase the exposure to guanfacine. Adjust guanfacine dose, p. 222. **Moderate** Study
- **Erythromycin** is predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 222. **Moderate** Theoretical
- **H2 receptor antagonists (cimetidine) slightly increase the exposure to erythromycin. **Moderate** Study
- **HIV-1 protease inhibitors (atazanavir, darunavir, fosamprenavir, indinavir, lopinavir, ritonavir) slightly to moderately increase the exposure to clarithromycin. Adjust dose in renal impairment. **Severe** Study
Macrolides (continued)

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, indinavir, lopinavir, ritonavir, tipranavir) are predicted to increase the exposure to erythromycin. [Severe] Theoretical
- Clarithromycin increases the exposure to HIV-protease inhibitors (saquinavir) and HIV-protease inhibitors (saquinavir) increase the exposure to clarithromycin. [Severe] Study
- Clarithromycin is predicted to markedly increase the exposure to birtunib. Avoid or adjust birtunib dose. [Severe] Study
- Erythromycin is predicted to increase the exposure to HIV-protease inhibitors (saquinavir). Avoid. [Severe] Study
- Clarithromycin is predicted to very markedly increase the exposure to imatinib. [Moderate] Study
- Erythromycin is predicted to increase the exposure to imatinib. [Moderate] Theoretical
- Clarithromycin is predicted to markedly increase the exposure to lomacaptop. Separate administration by 12 hours. [Moderate] Theoretical
- Clarithromycin is predicted to markedly increase the exposure to lomacaptop. Avoid. [Moderate] Study
- Erythromycin is predicted to increase the exposure to lomacaptop. Avoid. [Moderate] Study
- Lumacaftor is predicted to decrease the exposure to macrolides (clarithromycin, erythromycin). [Moderate] Theoretical
- Clarithromycin is predicted to markedly increase the exposure to lurasdone. [Moderate] Study
- Erythromycin is predicted to increase the exposure to lurasdone. [Moderate] Study
- Clarithromycin is predicted to markedly increase the exposure to macitentan. [Moderate] Study
- Clarithromycin is predicted to markedly increase the exposure to maraviroc. Adjust dose. [Severe] Study
- Clarithromycin is predicted to markedly increase the exposure to midazolam. Adjust midazolam dose. [Severe] Study
- Erythromycin is predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. [Severe] Study
- Clarithromycin is predicted to increase the exposure to mirabegron. Adjust mirabegron dose in hepatic and renal impairment. [Moderate] Study
- Clarithromycin is predicted to increase the exposure to modafinil. [Mild] Theoretical
- Clarithromycin increases the risk of neutropenia when given with monoclonal antibodies (brentuximab vedotin). Monitor and adjust dose. [Severe] Theoretical
- Clarithromycin is predicted to increase the exposure to monoclonal antibodies (trastuzumab emtansine). Avoid. [Severe] Theoretical
- Clarithromycin is predicted to markedly increase the exposure to naloxegol. Avoid. [Severe] Study
- Erythromycin is predicted to increase the exposure to naloxegol. Adjust naloxegol dose and monitor side effects. [Moderate] Study
- Clarithromycin is predicted to increase the exposure to netupitant. [Mild] Study
- Nevirapine decreases the exposure to clarithromycin. [Moderate] Study
- Clarithromycin is predicted to moderately increase the exposure to nilotinib. Avoid. [Severe] Study
- Also see TABLE 9 p. 820
- Erythromycin is predicted to increase the exposure to nilotinib. [Moderate] Theoretical
- Macrolides are predicted to increase the exposure to nintedanib. [Moderate] Study
- Clarithromycin is predicted to increase the exposure to nitritesone. Adjust nitritesone dose. [Moderate] Theoretical
- Clarithromycin is predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose. [Moderate] Study
- Erythromycin is predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose. [Moderate] Theoretical
- Erythromycin is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. [Moderate] Study
- Clarithromycin is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone, sufentanil). Monitor and adjust dose. [Severe] Study
- Clarithromycin is predicted to increase the exposure to opioids (methadone, sufentanil). [Moderate] Theoretical
- Clarithromycin is predicted to increase the exposure to oxybutynin. [Mild] Study
- Erythromycin is predicted to increase the exposure to oxybutynin. [Mild] Theoretical
- Clarithromycin is predicted to increase the exposure to palbociclib. Avoid or adjust palbociclib dose. [Severe] Study
- Clarithromycin is predicted to increase the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid. [Moderate] Study
- Clarithromycin is predicted to increase the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. [Severe] Theoretical
- Clarithromycin is predicted to increase the exposure to pazopanib. Avoid or adjust pazopanib dose. [Moderate] Study
- Clarithromycin is predicted to increase the exposure to pazopanib. [Moderate] Theoretical
- Erythromycin is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil). Adjust avanafil dose. [Mild] Theoretical
- Clarithromycin is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil). Adjust avanafil dose. [Severe] Study
- Clarithromycin is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Avoid or adjust sildenafil dose, p. 117. [Severe] Study
- Clarithromycin is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Monitor and adjust sildenafil dose, p. 117. [Moderate] Study
- Clarithromycin is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). Use with caution or avoid. [Severe] Study
- Erythromycin is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). [Severe] Theoretical
- Erythromycin is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). Adjust dose. [Severe] Theoretical
- Clarithromycin is predicted to increase the exposure to pimozide. Avoid. [Severe] Study
- Erythromycin is predicted to increase the exposure to pimozide. Avoid. [Severe] Theoretical
- Clarithromycin is predicted to slightly increase the exposure to ponatinib. Monitor and adjust ponatinib dose. [Moderate] Study
- Clarithromycin is predicted to moderately increase the exposure to praziquantel. [Mild] Study
- Clarithromycin is predicted to increase the exposure to quetiapine. Avoid. [Severe] Study
Rifabutin

- Rifampicin potentially decreases the clearance of and ticagrelor. Avoid. [Moderate] Study

- Erythromycin is predicted to increase the exposure to rifabutin. [Severe] Study

- Clarithromycin is predicted to increase the exposure to reboxetine. Avoid. [Moderate] Study

- Clarithromycin is predicted to increase the exposure to regorafenib. Avoid. [Moderate] Study

- Clarithromycin is predicted to increase the exposure to repaglinide. [Moderate] Study

- Clarithromycin is predicted to increase the exposure to retinoids (allitretinoin). Adjust allitretinoin dose. [Moderate] Theoretical

- Azithromycin increases the risk of neutropenia when given with rifabutin. [Severe] Study

- Clarithromycin increases the risk of uveitis when given with rifabutin. Adjust dose. [Severe] Study

- Rifampicin decreases the concentration of clarithromycin. [Severe] Study

- Clarithromycin is predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study → Also see TABLE 9 p. 820

- Clarithromycin is predicted to increase the exposure to ruoxitinib. Adjust dose and monitor side effects. [Moderate] Study

- Erythromycin is predicted to increase the exposure to ruoxitinib. [Moderate] Theoretical

- Clarithromycin is predicted to increase the exposure to saxagliptin. [Moderate] Study

- Erythromycin is predicted to increase the exposure to saxagliptin. [Moderate] Theoretical

- Clarithromycin is predicted to increase the exposure to simeprevir. Avoid. [Severe] Study

- Clarithromycin is predicted to increase the concentration of sirolimus. Avoid. [Severe] Study

- Erythromycin increases the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study

- Clarithromycin is predicted to increase the exposure to solifenacin. Adjust solifenacin or tamsulosin with solifenacin dose; avoid in hepatic and renal impairment. [Severe] Study

- Clarithromycin is predicted to moderately increase the exposure to SSRIs (dapoxetine). Avoid or adjust dapoxetine dose. [Severe] Study

- Erythromycin is predicted to increase the exposure to SSRIs (dapoxetine). Adjust dapoxetine dose. [Moderate] Theoretical

- Clarithromycin is predicted to increase the exposure to statins (atorvastatin). Avoid or adjust dose and monitor rhabdomyolysis. [Severe] Study

- Erythromycin is predicted to increase the exposure to statins (atorvastatin). Monitor and adjust dose. [Severe] Theoretical

- Clarithromycin moderately increases the exposure to statins (pravastatin). [Severe] Study

- Erythromycin is predicted to increase the exposure to statins (pravastatin). [Severe] Study

- Clarithromycin is predicted to increase the exposure to statins (simvastatin). Avoid. [Severe] Study

- Erythromycin is predicted to increase the exposure to statins (simvastatin). Use with caution and adjust simvastatin dose, p. 130. [Severe] Study

- Clarithromycin is predicted to slightly increase the exposure to sulfonlureas. [Moderate] Theoretical

- Clarithromycin is predicted to slightly increase the exposure to sunitinib. Avoid or adjust sunitinib dose. [Moderate] Study → Also see TABLE 9 p. 820

- Erythromycin is predicted to increase the exposure to sunitinib. [Moderate] Theoretical

- Clarithromycin is predicted to increase the concentration of tacrolimus. Avoid or adjust dose. [Severe] Study

- Erythromycin is predicted to increase the concentration of tacrolimus. [Severe] Study

- Clarithromycin is predicted to increase the exposure to taxanes (cabazitaxel). Avoid. [Severe] Study

- Erythromycin is predicted to increase the exposure to taxanes (cabazitaxel). [Moderate] Theoretical

- Clarithromycin is predicted to markedly increase the exposure to taxanes (docetaxel). Avoid or adjust dose. [Severe] Study

- Clarithromycin is predicted to increase the exposure to taxanes (paclitaxel). [Severe] Theoretical

- Clarithromycin is predicted to increase the concentration of temsirolimus. Avoid. [Severe] Theoretical

- Erythromycin is predicted to increase the concentration of temsirolimus. [Moderate] Theoretical

- Erythromycin decreases the clearance of theophylline and theophylline potentially decreases the clearance of erythromycin. Adjust dose. [Severe] Study

- Macrolides (azithromycin, clarithromycin) are predicted to increase the exposure to theophylline. Adjust dose. [Moderate] Theoretical

- Clarithromycin is predicted to increase the exposure to ticagrelor. Use with caution or avoid. [Severe] Study

- Clarithromycin is predicted to markedly increase the exposure to ticagrelor. Avoid. [Severe] Study

- Clarithromycin is predicted to increase the exposure to toferolidine. Avoid. [Severe] Study → Also see TABLE 9 p. 820

- Clarithromycin is predicted to increase the exposure to trabectedin. Avoid or adjust dose. [Severe] Theoretical

- Macrolides are predicted to increase the exposure to trametinib. [Moderate] Theoretical

- Clarithromycin is predicted to moderately increase the exposure to trametinib. Avoid or adjust dose. [Moderate] Study

- Erythromycin is predicted to increase the exposure to trametinib. [Moderate] Theoretical

- Clarithromycin is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Severe] Study

- Erythromycin is predicted to increase the exposure to ulipristal. [Moderate] Theoretical

- Clarithromycin is predicted to increase the exposure to vemurafenib. [Severe] Theoretical → Also see TABLE 9 p. 820

- Azithromycin is predicted to increase the exposure to venetoclax. Avoid or monitor for toxicity. [Severe] Theoretical

- Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to venetoclax. Avoid or adjust venetoclax dose. [Severe] Study

- Clarithromycin is predicted to increase the exposure to venlafaxine. [Moderate] Study → Also see TABLE 9 p. 820

- Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to vinca alkaloids. [Severe] Theoretical → Also see TABLE 9 p. 820

- Clarithromycin is predicted to increase the exposure to vitamin D substances (paricalcitol). [Moderate] Study

- Clarithromycin decreases the absorption of zidovudine. Separate administration by at least 2 hours. [Moderate] Study

- Clarithromycin is predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Theoretical

- Erythromycin is predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Study

### Magnesium

- Oral magnesium decreases the absorption of bisphosphonates (alendronic acid). Alendronic acid should be taken at least 30 minutes before magnesium. [Moderate] Study

- Oral magnesium is predicted to decrease the absorption of oral bisphosphonates (ibandronic acid). Avoid magnesium for at least 6 hours before or 1 hour after ibandronic acid. [Moderate] Theoretical
Magnesium

- **Oral magnesium** decreases the absorption of bisphosphonates (risendronate). Separate administration by at least 2 hours. [Moderate, Study]
- **Oral magnesium** decreases the absorption of bisphosphonates (sodium clodronate). Avoid magnesium for 2 hours before or 1 hour after sodium clodronate. [Moderate, Study]
- **Intravenous magnesium** potentially increases the risk of hypotension when given with calcium channel blockers (amlodipine, clevidipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine, verapamil) in pregnant women. [Severe, Anecdotal]
- **Intravenous magnesium** increases the effects of neuromuscular blocking drugs, non-depolarising. [Moderate, Study]
- **Intravenous magnesium** is predicted to increase the effects of saxemethonium. [Moderate, Study]

**Magnesium carbonate** → see antacids

**Magnesium trisilicate** → see antacids

**Maraviroc**

- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to maraviroc. Adjust dose. [Severe, Study]
- **Antifungals** (azoles) are predicted to markedly increase the exposure to maraviroc. [Severe, Study]
- **Intravenous magnesium** potentially increases the risk of haematological toxicity when given with maraviroc. Adjust dose. [Severe, Study]
- **Bosentan** is predicted to decrease the exposure to maraviroc. [Moderate, Theoretical]
- **Memantine** markedly increases the exposure to maraviroc. Refer to specialist literature. [Severe, Study]
- **Efavirenz** decreases the exposure to maraviroc. Refer to specialist literature. [Severe, Theoretical]
- **Enalaprilat** is predicted to decrease the exposure to maraviroc. Adjust dose. [Severe, Study]
- **Etravirine** (with a boosted protease inhibitor) increases the exposure to maraviroc. Avoid or adjust dose. [Moderate, Study]
- **HIV-protease inhibitors** (atazanavir, darunavir, lopinavir, ritonavir, saquinavir) increase the exposure to maraviroc. Refer to specialist literature. [Severe, Study]
- **Maraviroc** potentially decreases the exposure to HIV-protease inhibitors (fosamprenavir) and HIV-protease inhibitors (fosamprenavir) potentially decrease the exposure to maraviroc. Avoid. [Moderate, Study]
- **Maraviroc** is predicted to decrease the exposure to maraviroc. Adjust dose. [Severe, Theoretical]
- **Macrolides** (clarithromycin) are predicted to markedly increase the exposure to maraviroc. Adjust dose. [Severe, Study]
- **Rifampicin** is predicted to decrease the exposure to maraviroc. Adjust dose. [Severe, Study]
- **St John’s Wort** is predicted to decrease the exposure to maraviroc. Avoid. [Severe, Theoretical]

**Measles, mumps and rubella vaccine, live** → see live vaccines

**Mebendazole**

- **H₂ receptor antagonists** (cimetidine) increase the concentration of mebendazole. [Moderate, Study]

**Medroxyprogesterone**

- **Sugammadex** is predicted to decrease the exposure to medroxyprogesterone. Use additional contraceptive precautions. [Severe, Theoretical]

**Mefenamic acid** → see NSAIDs

**Mefloquine** → see antimalarials

**Melatonin** → see TABLE 11 p. 820 (CNS depressant effects)

- **Combined hormonal contraceptives** are predicted to increase the exposure to melatonin. [Moderate, Theoretical]
- **Quinolones** (ciprofloxacin) are predicted to increase the exposure to melatonin. [Moderate, Theoretical]
- **SSRIs** (fluvoxamine) very markedly increase the exposure to melatonin. Avoid. [Severe, Study]

**Meloxicam** → see NSAIDs

**Melphalan** → see alkylating agents

**Mepantidine**

- **Dopamine receptor agonists** (amantadine) increase the risk of CNS toxicity when given with mepantidine. Use with caution or avoid. [Severe, Theoretical]
- **Mepantidine** is predicted to increase the effects of dopamine receptor agonists (apomorphine, bromocriptine, cabergoline, pergolide, pramipexole, quinagolide, ropinirole, rotigotine). [Moderate, Theoretical]
- **Mepantidine** is predicted to increase the risk of CNS side-effects when given with ketamine. Avoid. [Severe, Theoretical]
- **Mepantidine** is predicted to increase the effects of levodopa. [Moderate, Theoretical]

**Mepactine**

- **Mepacrine** is predicted to increase the concentration of antimalarials (primaparine). Avoid. [Moderate, Theoretical]

**Mepipavacaine** → see anaesthetics, local

**Mepolizumab** → see monoclonal antibodies

**Meprobamate** → see TABLE 11 p. 820 (CNS depressant effects)

**Meptazinol** → see opioids

**Mercaptopurine** → see TABLE 1 p. 818 (hepatotoxicity), TABLE 15 p. 821 (myelosuppression)

- **Allopurinol** potentially increases the risk of haematological toxicity when given with mercaptopurine. Adjust mercaptopurine dose, p. 516. [Severe, Study]
- **Mercaptopurine** decreases the anticoagulant effect of coumarins. [Moderate, Anecdotal]
- **Febuxostat** is predicted to increase the exposure to mercaptopurine. Avoid. [Severe, Theoretical]
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with mercaptopurine. Public Health England advises avoid. [Severe, Theoretical]

**Meropenem** → see carbapenems

**Mesalazine**

**ROUTE-SPECIFIC INFORMATION**

The manufacturers of some mesalazine gastro-resistant and modified-release medicines (Asacol MR tablets, Ipocol, Salofalk granules) suggest that preparations that lower stool pH (e.g. lactulose) might prevent the release of mesalazine.

**Metaraminol** → see sympathomimetics, vasoconstrictor

**Metformin** → see TABLE 14 p. 821 (antidiabetic drugs)

**FOD AND LIFESTYLE**

Excessive alcohol consumption might increase the risk of lactic acidosis with metformin.

- **Dolutegravir** slightly to moderately increases the exposure to metformin. Use with caution and adjust dose. [Severe, Study]
- **H₂ receptor antagonists** (cimetidine) slightly increase the exposure to metformin. Monitor and adjust dose. [Moderate, Study]
- **Pitolisant** is predicted to increase the exposure to metformin. [Unknown, Theoretical]
- **Vandetanib** slightly increases the exposure to metformin. Monitor and adjust dose. [Moderate, Study]

**Methadone** → see opioids

**Methenamine**

- **Acetazolamide** is predicted to decrease the efficacy of methenamine. Avoid. [Moderate, Theoretical]
- **Potassium citrate** is predicted to decrease the efficacy of methenamine. Avoid. [Moderate, Theoretical]
- **Sodium bicarbonate** is predicted to decrease the efficacy of methenamine. Avoid. [Moderate, Theoretical]
- **Sodium citrate** is predicted to decrease the efficacy of methenamine. Avoid. [Moderate, Theoretical]

**Methocarbamol** → see TABLE 11 p. 820 (CNS depressant effects)

**Methotrexate** → see TABLE 1 p. 818 (hepatotoxicity), TABLE 15 p. 821 (myelosuppression), TABLE 2 p. 818 (nephrotoxicity), TABLE 5 p. 818 (thromboembolism)

- **Acetazolamide** increases the urinary excretion of methotrexate. [Moderate, Study]
- **Methotrexate** is predicted to decrease the clearance of aminophylline. [Moderate, Theoretical]
- **Antiepileptics** (levetiracetam) decrease the clearance of methotrexate. [Severe, Anecdotal]
- **Antimalarials** (pyrimethamine) are predicted to increase the risk of side-effects when given with methotrexate. [Severe, Theoretical]
- **Asparaginase** affects the efficacy of methotrexate. [Severe, Anecdotal]
- **Asparaginase** is predicted to increase the risk of toxicity when given with methotrexate. [Severe, Theoretical]
Crisantaspase affects the efficacy of methotrexate. (Severe) Anecdotal → Also see TABLE 1 p. 818 → Also see TABLE 15 p. 821

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with methotrexate. Public Health England advises avoid. (Severe) Theoretical

NSAID: are predicted to increase the risk of toxicity when given with methotrexate. Monitor and adjust dose. (Severe) Study → Also see TABLE 2 p. 818

Pegaspargase affects the efficacy of methotrexate. (Severe) Anecdotal → Also see TABLE 1 p. 818 → Also see TABLE 15 p. 821

Penicillins are predicted to increase the risk of toxicity when given with methotrexate. (Severe) Theoretical

Proton pump inhibitors decrease the clearance of methotrexate. Use with caution or avoid. (Severe) Study → Also see TABLE 15 p. 821

Quinolones (ciprofloxacin) potentially increase the risk of toxicity when given with methotrexate. Avoid. (Severe) Anecdotal

Regorafenib is predicted to increase the exposure to methotrexate. (Severe) Theoretical → Also see TABLE 15 p. 821

Retinoids (acitretin) are predicted to increase the concentration of methotrexate. Avoid. (Moderate) Anecdotal

Methotrexate is predicted to decrease the efficacy of sapropterin. (Moderate) Theoretical

Sulfonamides are predicted to increase the exposure to methotrexate. Use with caution or avoid. (Severe) Theoretical

Methotrexate is predicted to increase the risk of toxicity when given with methotrexate. Avoid. (Severe) Theoretical

Methotrexate decreases the clearance of theophylline. (Moderate) Study

Trimethoprim is predicted to increase the risk of side-effects when given with methotrexate. Avoid. (Severe) Theoretical → Also see TABLE 2 p. 818

Methylodopa → see TABLE 8 p. 819 (hypotension)

Entacapone is predicted to increase the exposure to methylodopa. (Moderate) Theoretical

Iron (oral) decreases the effects of methylodopa. (Moderate) Study

Methylodopa increases the risk of neurotoxicity when given with lithium. (Severe) Anecdotal

Monoamine-oxidase A and B inhibitors, irreversible are predicted to alter the antihypertensive effects of methylodopa. Avoid. (Severe) Theoretical → Also see TABLE 8 p. 819

Methylphenidate is predicted to decrease the effects of apraclonidine. Avoid. (Severe) Theoretical

Methylphenidate is predicted to increase the risk of elevated blood pressure when given with linezolid. Avoid. (Severe) Theoretical

Methylphenidate is predicted to increase the risk of a hypertensive crisis when given with moclobemide. (Severe) Theoretical

Methylphenidate is predicted to increase the risk of a hypertensive crisis when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid and for 14 days after stopping the MAOI. (Severe) Theoretical

Monoamine-oxidase B inhibitors (rasagiline, selegiline) are predicted to increase the risk of a hypertensive crisis when given with methylphenidate. Avoid. (Severe) Theoretical

Methylthioninium chloride → see TABLE 13 p. 821 (serotonin syndrome)

Methylthioninium chloride is predicted to increase the risk of severe hypertension when given with bupropion. Avoid. (Severe) Theoretical → Also see TABLE 13 p. 821

Metoclopramide is predicted to increase the risk of methaemoglobinemia when given with topical anaesthetics, local (prilocaine). Avoid. (Severe) Theoretical

Metoclopramide decreases the concentration of antimalarials (atovaquone). Avoid. (Moderate) Study

Metoclopramide is predicted to decrease the effects of dopamine receptor agonists (apomorphine, bromocriptine, cabergoline, pergolide, pramipexole, quinagolide, ropinirole, rotigotine). Avoid. (Moderate) Study

Metoclopramide decreases the effects of levodopa. Avoid. (Moderate) Study

Metoclopramide is predicted to increase the effects of neuromuscular blocking drugs, non-depolarising. (Moderate) Theoretical

Metoclopramide increases the effects of suxamethonium. (Moderate) Study

Metolazone → see thiazide diuretics

Metoprolol → see beta blockers, selective

Metronidazole → see TABLE 12 p. 821 (peripheral neuropathy)

Metronidazole increases the risk of toxicity when given with methotrexate. (Severe) Study → Also see TABLE 12 p. 821

Metronidazole increases the risk of acute psychoses when given with methotrexate. (Severe) Study

Metronidazole increases the risk of toxicity when given with fluorouracil. (Severe) Study

Metyrapone

Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to metronidazole. (Moderate) Study

Metronidazole is predicted to increase the risk of capetabine toxicity when given with capetabine. (Severe) Theoretical

Metronidazole increases the anticoagulant effects of coumarins. Monitor INR and adjust dose. (Severe) Study

Disulfiram increases the risk of acute psychoses when given with metronidazole. (Severe) Study → Also see TABLE 12 p. 821

Metronidazole increases the risk of toxicity when given with fluorouracil. (Severe) Study

Meperidine

Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone) decrease the effects of metypapone. Avoid. (Moderate) Study

Antihistamines, sedating (cyproheptadine) decrease the effects of metypapone. Avoid. (Moderate) Study

Carbamazepine decreases the effects of metypapone. Avoid. (Moderate) Theoretical

Propylthiouracil is predicted to decrease the effects of metypapone. Avoid. (Moderate) Theoretical

Tricyclic antidepressants (amitriptyline) decrease the effects of metypapone. Avoid. (Moderate) Theoretical

Mianserin → see TABLE 13 p. 821 (serotonin syndrome), TABLE 11 p. 820 (CNS depressant effects)

Antiepileptics (carbamazepine) markedly decrease the exposure to mianserin. Adjust dose. (Moderate) Study

Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to mianserin. (Moderate) Study → Also see TABLE 11 p. 820

Mianserin is predicted to increase the risk of toxicity when given with moclobemide. Avoid and for 1 week after stopping mianserin. (Severe) Theoretical → Also see TABLE 13 p. 821

Mianserin is predicted to increase the risk of toxicity when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid and for 14 days after stopping the MAOI. (Severe) Theoretical → Also see TABLE 13 p. 821

Mianserin is predicted to decrease the efficacy of piritazol. (Unknown) Theoretical

Mianserin decreases the effects of sympathomimetics, vasoconstrictor (ephedrine). (Severe) Anecdotal

Micafungin → see TABLE 1 p. 818 (hepatotoxicity)

Micafungin slightly increases the exposure to amphotericin. Avoid or monitor toxicity. (Moderate) Study

Miconazole → see antifungals,azole

Mizidalol → see TABLE 11 p. 820 (CNS depressant effects)

Antihypertensives (droxedaran) are predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. (Severe) Study
Midazolam (continued)

- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to midazolam. Monitor and adjust dose. (Moderate) Study 
  → Also see TABLE 11 p. 820.
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to markedly to very markedly increase the exposure to midazolam. Monitor side effects and adjust dose. (Severe) Study
- Antifungals, azoles (miconazole) are predicted to increase the exposure to midazolam. Avoid or adjust midazolam dose. (Severe) Study
- Nevirapine decreases the concentration of midazolam. Monitor and adjust dose. (Moderate) Study
- **Crizotinib** (high-dose) are predicted to decrease the efficacy of midazolam. Avoid. (Severe) Theoretical
- **NSAIDs** (high-dose) are predicted to decrease the efficacy of midazolam. Avoid. (Severe) Theoretical
- **Pimecrolimus** is predicted to decrease the efficacy of midazolam. Avoid. (Severe) Theoretical
- **Sirolimus** is predicted to decrease the efficacy of midazolam. Avoid. (Severe) Theoretical
- **Tacrolimus** is predicted to affect the efficacy of midazolam. Avoid. (Severe) Theoretical
- **Aprepitant** is predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. (Severe) Study
- **Boseantan** is predicted to decrease the concentration of midazolam. Monitor and adjust dose. (Moderate) Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. (Severe) Study
- **Cobicistat** is predicted to markedly to very markedly increase the exposure to midazolam. Avoid or adjust midazolam dose. (Severe) Study
- **Crizotinib** is predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. (Severe) Study
- **Dabrafenib** decreases the exposure to midazolam. Monitor and adjust dose. (Moderate) Study
- **Efavirenz** is predicted to alter the effects of midazolam. Avoid. (Moderate) Theoretical
- **Enzalutamide** is predicted to decrease the exposure to midazolam. Monitor and adjust dose. (Moderate) Study
- **Fosaprepitant** slightly increases the exposure to midazolam. (Moderate) Study
- HIV- protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to markedly to very markedly increase the exposure to midazolam. Avoid or adjust midazolam dose. (Severe) Study
- HIV-protease inhibitors (indinavir) are predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. (Severe) Study
- **Idelalisib** is predicted to markedly to very markedly increase the exposure to midazolam. Avoid or adjust midazolam dose. (Severe) Study
- **Imatinib** is predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. (Severe) Study
- **Lumacaftor** is predicted to decrease the exposure to midazolam. Avoid. (Severe) Theoretical
- Macrolides (clarithromycin) are predicted to markedly to very markedly increase the exposure to midazolam. Avoid or adjust midazolam dose. (Severe) Study
- Macrolides (erythromycin) are predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. (Severe) Study
- **Mifamurtide** is predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. (Severe) Study
- **Netupitant** increases the exposure to midazolam. (Moderate) Study
- Rifampicin is predicted to decrease the exposure to midazolam. Monitor and adjust dose. (Moderate) Study
- St John’s Wort moderately decreases the exposure to midazolam. Monitor and adjust dose. (Moderate) Study

Midodrine → see sympathomimetics, vasoconstrictor

Mifamurtide

- **Cyclosporin** is predicted to decrease the efficacy of mifamurtide. Avoid. (Severe) Theoretical
- **Corticosteroids** are predicted to decrease the efficacy of mifamurtide. Avoid. (Severe) Theoretical

Mifepristone

- Mifepristone is predicted to decrease the efficacy of corticosteroids. Use with caution and adjust dose. (Moderate) Theoretical

Minocycline → see tetracyclines

Minoxidil → see TABLE 8 p. 819 (hypotension)

Mirabegron

- **Mirabegron** is predicted to increase the exposure to aliskiren. (Mild) Theoretical
- **Mirabegron** is predicted to increase the exposure to antihistamines, non-sedating (fexofenadine). (Mild) Theoretical
- **Mirabegron** is predicted to increase the exposure to beta blockers, non-selective (carvedilol, timolol). (Moderate) Theoretical
- Mirabegron is predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). (Moderate) Study
- **Cobicistat** is predicted to increase the exposure to mirabegron. Adjust mirabegron dose in hepatic and renal impairment. (Moderate) Study
- **Mirabegron** is predicted to increase the exposure to colchicine. (Mild) Theoretical
- **Mirabegron** is predicted to increase the exposure to dabigatran. (Severe) Theoretical
- **Mirabegron** is predicted to increase the exposure to digoxin. Monitor digoxin concentration and adjust dose, p. 79. (Severe) Study
- **Mirabegron** is predicted to increase the exposure to edoxaban. (Mild) Theoretical
- **Mirabegron** is predicted to increase the exposure to everolimus. (Mild) Theoretical
- **Mirabegron** is predicted to increase the exposure to mifepristone. (Mild) Theoretical
- **Mirabegron** is predicted to increase the exposure to mirtazapine. (Mild) Theoretical
- **Mirabegron** is predicted to increase the exposure to piritramide. Use with caution and adjust dose. (Moderate) Study
- **Mirabegron** is predicted to increase the exposure to sirolimus. (Mild) Theoretical
- **Mirabegron** is predicted to increase the exposure to taxanes (paclitaxel). (Mild) Theoretical
- **Mirabegron** is predicted to increase the exposure to topotecan. (Mild) Theoretical
- **Mirabegron** is predicted to increase the exposure to tramadol. (Moderate) Study
- **Mirabegron** is predicted to increase the exposure to trilostane. (Mild) Theoretical

Mirtazapine → see TABLE 13 p. 821 (serotonin syndrome), TABLE 11 p. 820 (CNS depressant effects)

- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to mirtazapine. Adjust dose. (Moderate) Study → Also see TABLE 11 p. 820
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to mirtazapine. (Moderate) Study
- **Cobicistat** is predicted to increase the exposure to mirtazapine. (Moderate) Study

TABLE 11
Enzalutamide is predicted to decrease the exposure to mirtazapine. Adjust dose. [Moderate] Study
H₂ receptor antagonists (cimetidine) slightly increase the exposure to mirtazapine. Use with caution and adjust dose. [Moderate] Theoretical
HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to mirtazapine. [Moderate] Study
Idelalisib is predicted to increase the exposure to mirtazapine. [Moderate] Study
Macrolides (clarithromycin) are predicted to increase the exposure to mirtazapine. [Moderate] Study
Mirtazapine is predicted to decrease the efficacy of pitolisant. [Unknown] Theoretical
Rifampicin is predicted to decrease the exposure to mirtazapine. Adjust dose. [Moderate] Study
Mitomycin → see TABLE 15 p. 821 (myelosuppression), TABLE 5 p. 818 (thromboembolism)
Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with mitomycin. Public Health England advises avoid. [Severe] Theoretical
Mitotane → see TABLE 15 p. 821 (myelosuppression)
Alcohol and monoamine oxidase inhibitors (trimipramine) are predicted to decrease the effects of mitotane. Avoid. [Severe] Anecdotal
Mitoxantrone → see antineoplastic agents
Mivacurium → see neuromuscular blocking drugs, non-depolarising
Mizolastine → see antihistamines, non-sedating
Moclobemide → see TABLE 13 p. 821 (serotonin syndrome)

**FOOD AND LIFESTYLE** Moclobemide is claimed to cause less potentiation of the pressor effect of tyramine than the traditional (irreversible) MAOIs, but patients should avoid consuming large amounts of tyramine–rich foods (such as mature cheese, salami, pickled herring, Bovril®, Oxo®, Marmite® or any similar meat or yeast extract or fermented soya bean extract, and some beers, lagers or wines).

Moclobemide is predicted to increase the risk of a hypertensive crisis when given with amfetamines (dexamfetamine). Avoid. [Severe] Theoretical → Also see TABLE 13 p. 821
Moclobemide is predicted to increase the risk of a hypertensive crisis when given with lisdexamfetamine. Avoid. [Severe] Theoretical → Also see TABLE 13 p. 821
Moclobemide is predicted to increase the risk of a hypertensive crisis when given with mitomycin. Public Health England advises avoid. [Severe] Theoretical
Moclobemide is predicted to increase the exposure to mirtazapine. [Moderate] Study
Moclobemide is predicted to decrease the ef
Moclobemide is predicted to increase the effects of mirtazapine. Avoid. [Severe] Theoretical → Also see TABLE 13 p. 821
Moclobemide is predicted to increase the risk of a hypertensive crisis when given with sympathomimetics, vasoconstrictor (ephedrine, isomethepene, phylephrine, pseudoephedrine). Avoid. [Severe] Study
Moclobemide is predicted to increase the risk of side-effects when given with tedizolid. [Severe] Theoretical → Also see TABLE 13 p. 821
Tricyclic antidepressants are predicted to increase the effects of mirtazapine. Avoid. [Severe] Theoretical → Also see TABLE 13 p. 821
Moclobemide slightly increases the exposure to zolmitriptan. Adjust zolmitriptan dose, p. 280. [Moderate] Study → Also see TABLE 13 p. 821
Modafinil

| Antiepileptics (carbamazepine, phenobarbital, primidone) are predicted to decrease the exposure to modafinil. [Mild] Theoretical |
| Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to modafinil and modafinil is predicted to increase the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Moderate] Theoretical |
| Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to modafinil. [Mild] Theoretical |
| Modafinil is predicted to decrease the exposure to bosutinib. Avoid. [Severe] Theoretical |
| Modafinil is predicted to increase the exposure to ciclosporin. [Moderate] Theoretical |
| Modafinil is predicted to decrease the exposure to ciclosporin. [Moderate] Theoretical |
| Modafinil is predicted to decrease the exposure to bosutinib. Avoid. [Unknown] Theoretical |
| Modafinil is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Study |
| Modafinil is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical |
| Modafinil is predicted to decrease the exposure to elbasvir. Avoid. [Unknown] Theoretical |
| Modafinil is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical |
| Modafinil is predicted to decrease the exposure to grazoprevir. Avoid. [Unknown] Theoretical |
| HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to modafinil. [Mild] Theoretical |
| Modafinil is predicted to decrease the effects of hormone replacement therapy. [Moderate] Anecdotal |
| Idelalisib is predicted to increase the exposure to modafinil. [Mild] Theoretical |
| Modafinil is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical |
| Macrolides (clarithromycin) are predicted to increase the exposure to modafinil. [Mild] Theoretical |
| Modafinil is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Anecdotal |
| Rifampicin is predicted to decrease the exposure to modafinil. [Moderate] Theoretical |
| Modafinil decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Anecdotal |
| Moexipril → see ACE inhibitors |
| Mometasone → see corticosteroids |
| Mirtazapine – Monoamine-oxidase A and B inhibitors, irreversible → see TABLE 8 p. 821 (serotonin syndrome) |

**FOOD AND LIFESTYLE** Potentially life-threatening hypertensive crisis can develop in those taking MAOIs who eat tyramine-

TABLE 8

p. 821

Monoamine-oxidase A and B inhibitors, irreversible

Avoid.

TABLE 8

p. 819 (hypotension)

Also see

TABLE 8

p. 821

Monoamine-oxidase B inhibitors (safinamide) are predicted to increase the risk of side-effects when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid and for 1 week after stopping safinamide. [Severe] Theoretical  
Also see TABLE 13 p. 821

Monoamine-oxidase A and B inhibitors, irreversible

Avoid.

TABLE 8

p. 819

Also see

TABLE 8

p. 821

Monoamine-oxidase B inhibitors (rasagiline, selegiline) are predicted to increase the risk of severe hypertension when given with amfetamines. [Severe] Theoretical  
Also see TABLE 13 p. 821

Monoamine-oxidase A and B inhibitors, irreversible

Avoid.

TABLE 8

p. 819

Also see

TABLE 8

p. 821

Monoamine-oxidase B inhibitors (rasagiline, selegiline) are predicted to increase the risk of side-effects when given with monoamine-oxidase A and B inhibitors, irreversible.

Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical  
Also see TABLE 8 p. 819 (hypotension)  
Also see TABLE 13 p. 821

Monoamine-oxidase B inhibitors (safinamide) are predicted to increase the risk of side-effects when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid and for 1 week after stopping safinamide. [Severe] Theoretical  
Also see TABLE 13 p. 821

Nefopam is predicted to increase the risk of serious elevations in blood pressure when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid. [Severe] Theoretical

Opicapone is predicted to increase the risk of elevated blood pressure when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid. [Severe] Theoretical

Opioids are predicted to increase the risk of CNS excitation or depression when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid. [Severe] Study  
Also see TABLE 13 p. 821

Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the risk of neuroleptic malignant syndrome when given with phenothiazines. [Severe] Theoretical  
Also see TABLE 8 p. 819

Phlocodine is predicted to increase the risk of CNS excitation or depression when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical

Reboxetine is predicted to increase the risk of a hypertensive crisis when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid. [Severe] Theoretical

Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the exposure to rizatRIPTAN. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical  
Also see TABLE 13 p. 821

Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the exposure to sumatriptan. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical  
Also see TABLE 13 p. 821

Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the risk of a hypertensive crisis when given with sympathomimetics, inotropic. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical

Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the risk of a hypertensive crisis when given with sympathomimetics, vasoconstrictor. Avoid and for 14 days after stopping the MAOI. [Severe] Study

Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the risk of side-effects when given with tedzolid. [Severe] Theoretical  
Also see TABLE 13 p. 821

Tetrahydrozine is predicted to increase the risk of CNS toxicity when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical

Tolcapone is predicted to increase the effects of monoamine-oxidase A and B inhibitors, irreversible. Avoid. [Severe] Theoretical

Tricyclic antidepressants are predicted to increase the effects of monoamine-oxidase A and B inhibitors, irreversible. Avoid. [Severe] Theoretical

rasagiline - safinamide - selegiline

FOOD AND LIFESTYLE

Hypertension is predicted to occur when high-dose selegiline is taken with tyramine-rich foods (such as mature cheese, salami, pickled herring, Bovril®, Oxo®, Marmite® or any similar meat or yeast extract or fermented soya bean extract, and some beers, lagers or wines).

Monoamine-oxidase B inhibitors (rasagiline, selegiline) are predicted to increase the risk of severe hypertension when given with amfetamines. Avoid. [Severe] Theoretical

Also see TABLE 13 p. 821
Monoamine-oxidase B inhibitors — Monoclonal antibodies

Monoamine-oxidase B inhibitors (rasagiline, selegiline) are predicted to increase the risk of a hypertensive crisis when given with (clarithromycin) α-adrenergic agonists. Avoid. (Severe) Theoretical

Monoamine-oxidase B inhibitors (rasagiline, selegiline) are predicted to increase the risk of a hypertensive crisis when given with (pethidine) opioids. Avoid. (Severe) Theoretical

Safinamide is predicted to increase the risk of a hypertensive crisis when given with (dronedarone) β-adrenergic blockers. Avoid. (Severe) Theoretical

Safinamide is predicted to increase the risk of a hypertensive crisis when given with (divalproex) antiepileptics. Avoid. (Severe) Theoretical

Safinamide is predicted to increase the risk of a hypertensive crisis when given with (diltiazem) calcium channel blockers. Avoid. (Severe) Theoretical

Safinamide is predicted to increase the risk of a hypertensive crisis when given with (indomethacin) NSAIDs. Avoid. (Severe) Theoretical

Safinamide is predicted to increase the risk of a hypertensive crisis when given with (dexmedetomidine) α- and β-adrenergic agonists. Avoid. (Severe) Theoretical

Safinamide is predicted to increase the risk of a hypertensive crisis when given with (bupropion) dopaminergic agonists. Avoid. (Severe) Theoretical

Safinamide is predicted to increase the risk of a hypertensive crisis when given with (sildenafil) phosphodiesterase-5 inhibitors. Avoid. (Severe) Theoretical

Safinamide is predicted to increase the risk of a hypertensive crisis when given with (dipyridamole) platelet aggregation inhibitors. Avoid. (Severe) Theoretical

Safinamide is predicted to increase the risk of a hypertensive crisis when given with (tacrolimus) immunosuppressants. Avoid. (Severe) Theoretical

Safinamide is predicted to increase the risk of a hypertensive crisis when given with (dexamethasone) glucocorticoids. Avoid. (Severe) Theoretical

Safinamide is predicted to increase the risk of a hypertensive crisis when given with (midazolam) benzodiazepines. Avoid. (Severe) Theoretical

Safinamide is predicted to increase the risk of a hypertensive crisis when given with (chlorpromazine) phenothiazines. Avoid. (Severe) Theoretical

Safinamide is predicted to increase the risk of a hypertensive crisis when given with (chlorpromazine) phenothiazines. Avoid. (Severe) Theoretical
Monoclonal antibodies (continued)

- Blinatumomab is predicted to transiently increase the exposure to theophylline. Monitor and adjust dose. [Moderate] Theoretical

Montelukast

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to montelukast. [Mild] Study
- Enzalutamide is predicted to decrease the exposure to montelukast. [Mild] Study
- Fibrates (gemfibrozil) are predicted to moderately increase the exposure to montelukast. [Mild] Study
- Lumacaftor is predicted to decrease the exposure to montelukast. [Moderate] Theoretical
- Rifampicin is predicted to decrease the exposure to montelukast. [Mild] Study

Morphine → see opioids

Moxifloxacin → see quinolones

Moxisylyte → see TABLE 8 p. 819 (hypotension)

Moxonidine → see TABLE 8 p. 819 (hypotension), TABLE 11 p. 820 (CNS depressant effects)

- Tricyclic antidepressants are predicted to decrease the effects of moxonidine. Avoid. [Moderate] Theoretical
- Phenothiazines moderately decrease the exposure to moxني. Adjust naltrexone dose. [Moderate] Study

Mycephonolate → see TABLE 15 p. 821 (myelosuppression)

- Mycophenolate is predicted to increase the risk of haematological toxicity when given with acidocin. [Moderate] Theoretical
- Antacids decrease the exposure to mycophenolate. [Moderate] Study
- Mycophenolate is predicted to increase the risk of haematological toxicity when given with ganciclovir. [Moderate] Theoretical
- Montelukast is predicted to decrease the risk of generalised infection (possibly life-threatening) when given with mycophenolate. Public Health England advises avoid. [Severe] Theoretical
- Rifampicin decreases the concentration of mycophenolate. Monitor and adjust dose. [Severe] Study

Nabumetone → see NSAIDs

Nadolol → see beta blockers, non-selective

Nalidixic acid → see quinolones

Naltrexone

GENERAL INFORMATION Avoid concurrent use of opioids.

Nandrolone

- Nandrolone is predicted to increase the anticoagulant effect of coumarins. Monitor and adjust dose. [Severe] Theoretical
- Nandrolone is predicted to increase the anticoagulant effect of phenindione. Monitor and adjust dose. [Severe] Theoretical

Naproxen → see NSAIDs

Naratriptan → see TABLE 13 p. 821 (serotonin syndrome)

- Naratriptan is predicted to increase the risk of vasoconstriction when given with ergotamine. Separate administration by 24 hours. [Severe] Theoretical

Natalizumab → see monoclonal antibodies

Neteglinide → see TABLE 14 p. 821 (antidiabetic drugs)

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to slightly decrease the exposure to neteglinide. [Mild] Study
- Enzalutamide is predicted to slightly decrease the exposure to neteglinide. [Mild] Study
- Rifampicin is predicted to slightly decrease the exposure to neteglinide. [Mild] Study
- Sulfinpyrazone slightly increases the exposure to neteglinide. [Mild] Study

Nebivolol → see beta blockers, selective

Necitumumab → see monoclonal antibodies

Nefopam → see TABLE 10 p. 820 (antimuscarinics)

- Nefopam is predicted to increase the risk of serious elevations in blood pressure when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid. [Severe] Theoretical

Nelarabine → see TABLE 15 p. 821 (myelosuppression)

Neomyccin → see TABLE 2 p. 818 (nephrotoxicity), TABLE 19 p. 822 (ototoxicity), TABLE 20 p. 822 (neuromuscular blocking effects)

- Neomyccin decreases the absorption of digoxin. [Moderate] Study
- Neomyccin moderately decreases the exposure to sorafinib. [Moderate] Study

Neostigmine → see TABLE 6 p. 819 (bradycardia), TABLE 20 p. 822 (neuromuscular blocking effects)

- Aminoglycosides are predicted to decrease the effects of neostigmine. [Moderate] Theoretical

Nepafenac → see NSAIDs
### Interactions

#### Netupitant – Netupitant

**Netupitant**

- **Netupitant is predicted to increase the exposure to aldoosterone antagonists** (epilone). Adjust epilone dose. **Severe** Study
- **Netupitant is predicted to increase the exposure to alpha blockers** (tamsulosin). **Moderate** Theoretical
- **Netupitant is predicted to increase the exposure to alprazolam.** **Severe** Study
- **Netupitant is predicted to increase the exposure to antiarrhythmics** (propafenone). Monitor and adjust dose. **Moderate** Study
- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to netupitant. **Avoid.** **Moderate** Study
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to decrease the exposure to netupitant. **Mild** Study
- **Netupitant is predicted to increase the exposure to Dutasteride.** **Moderate** Study
- **Netupitant is predicted to increase the concentration of ciclosporin.** **Severe** Study
- **Cobicistat** is predicted to increase the exposure to netupitant. **Mild** Study
- **Netupitant is predicted to increase the exposure to darifenacin.** **Severe** Theoretical
- **Netupitant is predicted to increase the exposure to dasatinib.** **Severe** Study
- **Netupitant increases the risk of QT-prolongation when given with domperidone.** **Avoid.** **Severe** Study
- **Netupitant is predicted to increase the exposure to dopamine receptor agonists** (bromocriptine, cabergoline). **Severe** Theoretical
- **Netupitant is predicted to moderately increase the exposure to dutasteride.** **Mild** Study
- **Enzalutamide is predicted to decrease the exposure to netupitant.** **Avoid.** **Moderate** Study
- **Netupitant is predicted to increase the risk of ergotism when given with ergometrine.** **Severe** Theoretical
- **Netupitant is predicted to increase the exposure to everolimus.** **Avoid or adjust dose.** **Moderate** Study
- **Netupitant is predicted to increase the exposure to fesoterodine.** Adjust fesoterodine dose in hepatic and renal impairment. **Mild** Study
- **Netupitant is predicted to increase the exposure to gefitinib.** **Moderate** Theoretical
- **Netupitant is predicted to increase the concentration of guanfacine.** Adjust guanfacine dose, p. 222. **Moderate** Theoretical
- **Netupitant is predicted to increase the exposure to HIV-protease inhibitors** (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to netupitant. **Mild** Study
- **Netupitant is predicted to increase the exposure to ibrutinib.** Avoid or adjust ibrutinib dose. **Severe** Theoretical
- **Idelalisib** is predicted to increase the exposure to netupitant. **Mild** Study
- **Netupitant is predicted to increase the exposure to imatinib.** **Moderate** Theoretical
- **Netupitant is predicted to increase the exposure to ivabradine.** Adjust ivabradine dose. **Severe** Theoretical
- **Netupitant is predicted to increase the exposure to ivacaftor.** Adjust ivacaftor dose, p. 179. **Severe** Study
- **Netupitant is predicted to increase the exposure to lapatinib.** **Moderate** Study
- **Netupitant is predicted to increase the exposure to lirinotide.** **Avoid.** **Moderate** Theoretical
- **Netupitant is predicted to increase the exposure to lurasidone.** **Moderate** Study
- **Netupitant is predicted to increase the exposure to lumacaftor.** **Moderate** Study
- **Netupitant is predicted to increase the exposure to olaparib.** Avoid or adjust olaparib dose. **Moderate** Theoretical
- **Netupitant is predicted to increase the exposure to opioids** (alfenatil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. **Moderate** Study
- **Netupitant is predicted to increase the exposure to opioids** (methadone, sufentanil). **Moderate** Theoretical
- **Netupitant is predicted to increase the exposure to oxybutynin.** **Mild** Theoretical
- **Netupitant is predicted to increase the exposure to pazopanib.** **Moderate** Theoretical
- **Netupitant is predicted to increase the exposure to phosphodiesterase type-5 inhibitors** (avanafil). Adjust avanafil dose. **Moderate** Theoretical
- **Netupitant is predicted to increase the exposure to phosphodiesterase type-5 inhibitors** (sildenafil). Monitor and adjust sildenafil dose, p. 117. **Moderate** Study
- **Netupitant is predicted to increase the exposure to phosphodiesterase type-5 inhibitors** (tadalafil). **Severe** Theoretical
- **Netupitant is predicted to increase the exposure to phosphodiesterase type-5 inhibitors** (vardenafil). Adjust dose. **Severe** Theoretical
- **Netupitant is predicted to increase the exposure to pimozide.** **Avoid.** **Severe** Theoretical
- **Netupitant is predicted to increase the exposure to quetiapine.** **Avoid.** **Severe** Study
- **Netupitant is predicted to increase the exposure to ranolazine.** **Severe** Study
- **Refamipicin is predicted to decrease the exposure to netupitant.** **Avoid.** **Moderate** Study
- **Netupitant is predicted to increase the exposure to ranolazine.** **Severe** Study
- **Netupitant is predicted to increase the exposure to saxagliptin.** **Mild** Study
- **Netupitant is predicted to increase the exposure to sirolimus.** Monitor and adjust dose. **Moderate** Study
- **Netupitant increases the concentration of sirolimus.** Monitor and adjust dose. **Moderate** Study
- **Netupitant is predicted to increase the exposure to SSRIs** (dopoxetine). Adjust dopoxetine dose. **Moderate** Theoretical
- **Netupitant is predicted to increase the exposure to statins** (atorvastatin). Monitor and adjust dose. **Severe** Theoretical
- **Netupitant is predicted to increase the exposure to statins** (simvastatin). Use with caution and adjust simvastatin dose, p. 130. **Severe** Study
Netupitant—Nevirapine

Netupitant (continued)

- **Netupitant** is predicted to increase the exposure to **sunitinib**.  
  - [Moderate] Theoretical

- **Netupitant** is predicted to increase the concentration of **tacrolimus**.  
  - [Severe] Study

- **Netupitant** is predicted to increase the exposure to **taxanes** (*cabazitaxel*).  
  - [Moderate] Theoretical

- **Netupitant** is predicted to increase the concentration of **temsirolimus**.  
  - [Mild] Theoretical

- **Netupitant** is predicted to increase the exposure to **tolterodine**.  
  - [Moderate] Theoretical

- **Netupitant** is predicted to increase the exposure to **tolvaptan**.  
  - Adjust dose. [Moderate] Theoretical

- **Netupitant** is predicted to increase the exposure to **trazodone**.  
  - Adjust dose. [Moderate] Study

- **Netupitant** is predicted to increase the exposure to **ulipristal**.  
  - Avoid if used for uterine fibroids. [Moderate] Study

- **Netupitant** is predicted to increase the exposure to **venoctalax**.  
  - Avoid or adjust venoctalax dose. [Severe] Study

- **Netupitant** is predicted to increase the exposure to **vinca alkaloids**.  
  - [Severe] Theoretical

- **Netupitant** is predicted to increase the exposure to **zopiclone**.  
  - Adjust dose. [Moderate] Study

### Neuromuscular blocking drugs, non-depolarising

- See TABLE 6 p. 819 (Bradycardia). TABLE 20 p. 822 (Neuromuscular blocking effects)

- **Aminoglycosides** are predicted to increase the risk of prolonged neuromuscular blockade when given with neuromuscular blocking drugs, non-depolarising.  
  - [Severe] Theoretical

- **Anticholinesterases, centrally acting** are predicted to decrease the effects of neuromuscular blocking drugs, non-depolarising.  
  - [Moderate] Theoretical

- **Antiepileptics (carbamazepine)** are predicted to decrease the effects of (but acute use increases the effects of) neuromuscular blocking drugs, non-depolarising.  
  - Monitor and adjust dose. [Moderate] Study

- **Antiepileptics (fosphenytoin, phenytoin)** increase the effects of (but acute use increases the effects of) neuromuscular blocking drugs, non-depolarising (atracurium, cisatracurium, pancuronium, rocuronium, vecuronium).  
  - [Severe] Theoretical

- **Clindamycin** increases the effects of neuromuscular blocking drugs, non-depolarising.  
  - [Severe] Anecdotal

- **Colistimethate** increases the effects of neuromuscular blocking drugs, non-depolarising.  
  - Monitor and adjust dose. [Moderate] Study

- **Corticosteroids** are predicted to decrease the effects of neuromuscular blocking drugs, non-depolarising.  
  - [Severe] Anecdotal

- **Pancuronium** is predicted to increase the risk of cardiovascular side-effects when given with **digoxin**.  
  - [Severe] Anecdotal

- **Irinotecan** is predicted to decrease the effects of neuromuscular blocking drugs, non-depolarising.  
  - [Moderate] Theoretical

- **Intravenous magnesium** increases the effects of neuromuscular blocking drugs, non-depolarising.  
  - [Moderate] Study

- **Metoclopramide** is predicted to increase the effects of neuromuscular blocking drugs, non-depolarising.  
  - [Moderate] Theoretical

- **Penicillins (piperacillin)** increase the effects of neuromuscular blocking drugs, non-depolarising.  
  - [Moderate] Study

- **SSRIs** potentially increase the risk of prolonged neuromuscular blockade when given with **mivacurium**.  
  - [Unknown] Theoretical

### Nevirapine

- **Nevirapine** is predicted to decrease the exposure to **antiarrhythmics (dronedarone)**.  
  - [Severe] Theoretical

- **Nevirapine** is predicted to decrease the concentration of antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) and antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of nevirapine.  
  - [Severe] Study

- **Antifungals, azoles (fluconazole)** slightly to moderately increase the exposure to nevirapine.  
  - [Moderate] Study

- **Nevirapine** is predicted to decrease the exposure to **antifungals, azoles (itraconazole)**.  
  - Avoid. [Severe] Theoretical

- **Nevirapine** moderately decreases the exposure to antifungals, azoles (itraconazole). Avoid nevirapine for 14 days before and during treatment with itraconazole.  
  - [Moderate] Study

- **Nevirapine** moderately decreases the exposure to antifungals, azoles (ketoconazole).  
  - Avoid. [Severe] Study

- **Nevirapine** is predicted to decrease the exposure to antifungals, azoles (voriconazole) and antifungals, azoles (voriconazole) increase the exposure to nevirapine. Monitor and adjust dose.  
  - Avoid. [Severe] Theoretical

- **Nevirapine** is predicted to decrease the exposure to **bosutinib**.  
  - Avoid. [Severe] Study

- **Nevirapine** is predicted to decrease the exposure to **cabazitabine**.  
  - Avoid. [Severe] Theoretical

- **Nevirapine** is predicted to decrease the exposure to **calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine)**. Monitor and adjust dose.  
  - Avoid. [Severe] Theoretical

- **Nevirapine** is predicted to decrease the exposure to **calcium channel blockers** (diltiazem, verapamil).  
  - [Moderate] Theoretical

- **Nevirapine** is predicted to decrease the concentration of **clonazepam**.  
  - Avoid. [Severe] Theoretical

- **Nevirapine** is predicted to decrease the concentration of **ciclosporin**.  
  - Avoid. [Severe] Study

- **Nevirapine** is predicted to decrease the exposure to **cobimetinib**.  
  - Avoid. [Severe] Theoretical

- **Nevirapine** is predicted to decrease the exposure to **cobimetinib**.  
  - Avoid. [Severe] Theoretical

- **Nevirapine** is predicted to decrease the exposure to **dofetilide**.  
  - For FSFR guidance, see Contraceptives, interactions p. 474.  
  - [Severe] Study

- **Nevirapine** potentially alters the anticoagulant effect of **coumarins**.  
  - Avoid. [Severe] Theoretical

- **Nevirapine** is predicted to decrease the exposure to **crizotinib**.  
  - Avoid. [Severe] Theoretical

- **Nevirapine** is predicted to decrease the exposure to **daclatasvir**.  
  - Avoid. [Severe] Theoretical

- **Nevirapine** is predicted to decrease the exposure to **dasatinib**.  
  - Avoid. [Severe] Study

- **Nevirapine** is predicted to decrease the efficacy of **desogestrel**.  
  - For FSFR guidance, see Contraceptives, interactions p. 474.  
  - [Severe] Theoretical

- **Nevirapine** decreases the exposure to **dolutegravir**.  
  - Adjust dose. [Severe] Study

- **Nevirapine** decreases the concentration of **efavirenz**.  
  - Avoid. [Severe] Study

- **Nevirapine** is predicted to moderately decrease the exposure to **elbasvir**.  
  - Avoid. [Severe] Study

- **Nevirapine** is predicted to decrease the concentration of **elvitegravir**.  
  - Avoid. [Severe] Theoretical

- **Nevirapine** is predicted to decrease the effects of **ergotamine**.  
  - [Moderate] Theoretical

- **Nevirapine** is predicted to decrease the exposure to **erlotinib**.  
  - [Severe] Theoretical

- **Nevirapine** is predicted to decrease the efficacy of **etolongestral**.  
  - For FSFR guidance, see Contraceptives, interactions p. 474.  
  - [Severe] Theoretical

- **Nevirapine** is predicted to decrease the exposure to **etolongestral**.  
  - [Severe] Theoretical

- **Nevirapine** is predicted to decrease the exposure to **etolongestral**.  
  - [Severe] Theoretical

- **Nevirapine** is predicted to decrease the exposure to **etolongestral**.  
  - [Severe] Theoretical

- **Nevirapine** is predicted to decrease the exposure to **etolongestral**.  
  - [Severe] Theoretical

- **Nevirapine** is predicted to decrease the exposure to **etolongestral**.  
  - [Severe] Theoretical

- **Nevirapine** is predicted to decrease the exposure to **etolongestral**.  
  - [Severe] Theoretical

- **Nevirapine** is predicted to decrease the concentration of **everolimus**.  
  - Avoid or adjust dose. [Severe] Study

- **Nevirapine** is predicted to decrease the exposure to **gefitinib**.  
  - Avoid. [Severe] Theoretical

- **Nevirapine** is predicted to markedly decrease the exposure to **grazoprevir**.  
  - Avoid. [Severe] Study

- **Nevirapine** is predicted to decrease the concentration of **guanfacine**.  
  - Adjust dose. [Moderate] Theoretical
Nevirapine decreases the exposure to HIV-protease inhibitors. Refer to specialist literature. (Moderate) Study
Nevirapine is predicted to decrease the effects of Hormone replacement therapy. (Moderate) Anecdotal
Nevirapine is predicted to decrease the exposure to imatinib. (Moderate) Study
Nevirapine is predicted to decrease the exposure to lapatinib. Avoid. (Severe) Study
Nevirapine is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 474. (Severe) Theoretical
Nevirapine is predicted to decrease the exposure to lurasidone. Monitor and adjust dose. (Moderate) Theoretical
Nevirapine decreases the exposure to macrolides (clarithromycin). (Moderate) Study
Nevirapine decreases the concentration of midazolam. Monitor and adjust dose. (Moderate) Study
Nevirapine is predicted to decrease the exposure to nilotinib. Avoid. (Severe) Theoretical
Nevirapine is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 474. (Severe) Anecdotal
Nevirapine is predicted to decrease the exposure to olaparib. Avoid. (Moderate) Theoretical
Nevirapine decreases the exposure to opioids (methadone). Monitor and adjust dose. (Severe) Study
Nevirapine is predicted to decrease the exposure to osimertinib. (Severe) Theoretical
Nevirapine is predicted to decrease the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. (Severe) Study
Nevirapine is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors. (Moderate) Theoretical
Rifampicin increases the concentration of nevirapine. Avoid. (Severe) Study
Nevirapine is predicted to decrease the exposure to rilpivirine. Avoid. (Severe) Theoretical
Nevirapine is predicted to decrease the exposure to ruxolitinib. Monitor and adjust dose. (Moderate) Theoretical
Nevirapine is predicted to decrease the exposure to simprevir. Avoid. (Severe) Study
Nevirapine is predicted to decrease the concentration of sirolimus. Monitor and adjust dose. (Moderate) Theoretical
St John's Wort is predicted to decrease the concentration of nevirapine. Avoid. (Severe) Theoretical
Nevirapine slightly decreases the exposure to statins (atorvastatin). (Mild) Study
Nevirapine moderately decreases the exposure to statins (simvastatin). (Moderate) Study
Nevirapine is predicted to decrease the concentration of tacrolimus. Monitor and adjust dose. (Moderate) Theoretical
Nevirapine is predicted to decrease the exposure to taxanes (cabazitaxel). Avoid. (Severe) Study
Nevirapine is predicted to decrease the concentration of temsirolimus. Avoid. (Severe) Theoretical
Nevirapine is predicted to decrease the exposure to ticagrelor. (Moderate) Theoretical
Nevirapine is predicted to decrease the exposure to tolvaptan. (Moderate) Theoretical
Nevirapine decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 474. (Severe) Anecdotal
Nevirapine is predicted to decrease the exposure to velpatasvir. Avoid. (Moderate) Theoretical
Nevirapine is predicted to decrease the concentration of zidovudine. Refer to specialist literature. (Severe) Theoretical
Nicardipine → see calcium channel blockers
Nicorandil → see TABLE 8 p. 819 (hypotension)
Aspirin is predicted to increase the risk of gastrointestinal perforation when given with nicorandil. (Severe) Anecdotal
Corticosteroids increase the risk of gastrointestinal perforation when given with nicorandil. (Severe) Anecdotal
Nicorandil is predicted to increase the risk of gastrointestinal perforation when given with NSAIDs. (Severe) Theoretical
Nicorandil is predicted to increase the risk of hypotension when given with phosphodiesterase type-5 inhibitors. Avoid. (Severe) Theoretical → Also see TABLE 8 p. 819
Nicotinic acid → see TABLE 3 p. 818 (anticoagulant effects)
Nicotinic acid is predicted to increase the risk of rhabdomyolysis when given with statins. (Severe) Theoretical
Nifedipine → see calcium channel blockers
Nilotinib → see TABLE 15 p. 821 (myelosuppression), TABLE 9 p. 820 (QT-interval prolongation)
Nilotinib is predicted to increase the exposure to aldosterone antagonists (eplerenone). Adjust eplerenone dose. (Severe) Study
Nilotinib is predicted to increase the exposure to alpha blockers (tamsulosin). (Moderate) Theoretical
Nilotinib is predicted to increase the exposure to alprazolam. (Severe) Study
Antacids are predicted to decrease the absorption of nilotinib. Separate administration by at least 2 hours. (Moderate) Theoretical
Antiarrhythmics (dronedarone) are predicted to increase the exposure to nilotinib. (Moderate) Theoretical → Also see TABLE 9 p. 820
Nilotinib is predicted to increase the exposure to antiarrhythmics (propafenone). Monitor and adjust dose. (Moderate) Study
Nilotinib is predicted to increase the exposure to antifungals, azoles (fluconazole, posaconazole) are predicted to increase the exposure to nilotinib. (Moderate) Theoretical
Nilotinib is predicted to increase the exposure to antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to nilotinib. Avoid. (Severe) Study
Nilotinib is predicted to increase the exposure to antimalarials (piperaquine). (Severe) Theoretical
Aprépitant is predicted to increase the exposure to nilotinib. (Moderate) Theoretical
Nilotinib is predicted to increase the exposure to axitinib. (Moderate) Theoretical → Also see TABLE 15 p. 821
Nilotinib is predicted to increase the exposure to bedaquiline. Avoid prolonged use. (Mild) Theoretical → Also see TABLE 9 p. 820
Bosantan is predicted to decrease the exposure to nilotinib. Avoid. (Severe) Theoretical
Nilotinib is predicted to increase the exposure to bosutinib. Avoid or adjust bosutinib dose. (Severe) Theoretical → Also see TABLE 15 p. 821 → Also see TABLE 9 p. 820
Nilotinib is predicted to increase the exposure to buspirone. Use with caution and adjust dose. (Moderate) Study
Nilotinib is predicted to increase the exposure to cabozantinib. (Moderate) Theoretical → Also see TABLE 15 p. 821 → Also see TABLE 9 p. 820
Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to nilotinib. (Moderate) Theoretical
Nilotinib is predicted to increase the exposure to calcium channel blockers (amiodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. (Moderate) Study
Nilotinib is predicted to increase the exposure to ceritinib. (Moderate) Theoretical → Also see TABLE 15 p. 821 → Also see TABLE 9 p. 820
Calcium channel blockers are predicted to increase the exposure to nilotinib. (Moderate) Theoretical
Nilotinib is predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. (Moderate) Study
Nilotinib is predicted to increase the risk of bleeding events when given with coumarins. (Severe) Theoretical
Nilotinib (continued)

- Nilotinib is predicted to slightly increase the exposure to
  darifenacin. [Moderate] Study
- Nilotinib is predicted to increase the exposure to dasatinib.
  [Severe] Study → Also see TABLE 15 p. 821 Also see TABLE 9 p. 820
- Nilotinib increases the risk of QT-prolongation when given
  with domperidone. Avoid. [Severe] Study
- Nilotinib is predicted to increase the exposure to dopamine
  receptor agonists (bromocriptine, cabergoline). [Severe] Theoretical
- Nilotinib is predicted to moderately increase the exposure
to dutasteride. [Mild] Study
- Efavirenz is predicted to decrease the exposure to nilotinib.
  Avoid. [Severe] Theoretical
- Enzalutamide is predicted to moderately decrease the exposure
to nilotinib. Avoid. [Severe] Study
- Nilotinib is predicted to increase the risk of ergotism when
  given with ergometrine. [Severe] Theoretical
- Nilotinib is predicted to increase the risk of ergotism when
  given with ergotamine. [Severe] Theoretical
- Nilotinib is predicted to increase the exposure to erlotinib.
  [Mild] Theoretical
- Nilotinib is predicted to slightly increase the concentration of
  everolimus. Avoid or adjust dose. [Moderate] Study → Also see
  TABLE 15 p. 821
- Nilotinib is predicted to increase the exposure to fesoterodine.
  Adjust fesoterodine dose in hepatic and renal impairment.
  [Mild] Study
- Nilotinib is predicted to increase the exposure to gefitinib.
  [Theoretical] → Also see TABLE 15 p. 821
- Grapefruit juice is predicted to increase the exposure to
  nilotinib. Avoid. [Severe] Theoretical
- Nilotinib is predicted to increase the concentration of
- H₂ receptor antagonists are predicted to decrease the
  absorption of nilotinib. H₂ receptor antagonists should be taken
  10 hours before or 2 hours after nilotinib. [Mild] Theoretical
- HIV-protective inhibitors (atazanavir, darunavir, fosamprenavir,
  lopinavir, ritonavir, saquinavir, tipranavir) are predicted to
  moderately increase the exposure to nilotinib. Avoid. [Severe]
  Study → Also see TABLE 9 p. 820
- Nilotinib is predicted to increase the exposure to ibrutinib.
  Avoid or adjust ibrutinib dose. [Severe] Theoretical → Also see
  TABLE 15 p. 821
- Idelalisib is predicted to moderately increase the exposure
to nilotinib. Avoid. [Severe] Study → Also see TABLE 15 p. 821
- Nilotinib is predicted to increase the exposure to ivabradine.
  Adjust ivabradine dose. [Severe] Theoretical
- Nilotinib is predicted to increase the exposure to ivacaftor.
  Adjust ivacaftor dose. p. 179. [Severe] Study
- Nilotinib is predicted to increase the exposure to laptatinib.
  [Moderate] Study → Also see TABLE 9 p. 820
- Nilotinib is predicted to increase the exposure to lonitamide.
  Avoid. [Moderate] Theoretical
- Nilotinib is predicted to increase the exposure to lurasidone.
  [Moderate] Study
- Macrolides (clarithromycin) are predicted to moderately
  increase the exposure to nilotinib. Avoid. [Severe] Study → Also
  see TABLE 9 p. 820
- Macrolides (erythromycin) are predicted to increase the
  exposure to nilotinib. [Moderate] Theoretical
- Nilotinib is predicted to increase the exposure to midazolam.
  Monitor side effects and adjust dose. [Severe] Study
- Nilotinib is predicted to increase the exposure to naloxedol.
  Adjust naloxedol dose and monitor side effects. [Moderate] Study
- Netupitant is predicted to increase the exposure to nilotinib.
  [Moderate] Theoretical
- Nevirapine is predicted to decrease the exposure to nilotinib.
  Avoid. [Severe] Theoretical
- Nilotinib is predicted to increase the exposure to olaparib.
  Avoid or adj. olaparib dose. [Moderate] Theoretical → Also see
  TABLE 15 p. 821
- Nilotinib is predicted to increase the exposure to opioids
  (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and
  adjust dose. [Moderate] Study
- Nilotinib is predicted to increase the exposure to opioids
  (methadone, sufentanil). [Moderate] Theoretical → Also see TABLE 9
  p. 820
- Nilotinib is predicted to increase the exposure to oxybutynin.
  [Mild] Theoretical
- Nilotinib is predicted to increase the exposure to pazopanib.
  [Moderate] Theoretical → Also see TABLE 15 p. 821 Also see TABLE 9
  p. 820
- Nilotinib is predicted to increase the risk of bleeding events
  when given with phenindione. [Severe] Theoretical
- Nilotinib is predicted to increase the exposure to
  phosphodiesterase type-5 inhibitors (avansafin). Adjust avansafin
dose. [Moderate] Theoretical
- Nilotinib is predicted to increase the exposure to
  phosphodiesterase type-5 inhibitors (sildenafil). Monitor and
  adjust sildenafil dose, p. 117. [Moderate] Study → Also see TABLE 9
  p. 820
- Nilotinib is predicted to increase the exposure to
  phosphodiesterase type-5 inhibitors (vardenafin). Adjust dose.
  [Severe] Theoretical → Also see TABLE 9 p. 820
- Nilotinib is predicted to increase the exposure to pimozone.
  Avoid. [Severe] Theoretical → Also see TABLE 9 p. 820
- Nilotinib is predicted to increase the exposure to
  phosphodiesterase type-5 inhibitors (tadalafil). Avoid. [Moderate]
  Study
- Nilotinib is predicted to increase the exposure to
  ranolazine. [Severe] Study → Also see TABLE 9 p. 820
- Rifampicin is predicted to moderately decrease the exposure
  to nilotinib. Avoid. [Severe] Study
- Nilotinib is predicted to increase the exposure to
  ruxolitinib. [Moderate] Theoretical → Also see TABLE 15 p. 821
- Nilotinib is predicted to increase the exposure to
  saxagliptin. [Mild] Study
- Nilotinib is predicted to increase the exposure to
  simprevir. Avoid. [Severe] Study
- Nilotinib increases the concentration of sirolimus. Monitor and
  adjust dose. [Moderate] Study
- Nilotinib is predicted to increase the exposure to SSRIs
- St John’s Wort is predicted to decrease the exposure to
  nilotinib. Avoid. [Severe] Theoretical
- Nilotinib is predicted to increase the exposure to statins
  (atorvastatin). Monitor and adjust dose. [Severe] Theoretical
- Nilotinib is predicted to increase the exposure to statins
  (simvastatin). Use with caution and adjust simvastatin
dose, p. 130. [Severe] Study
- Nilotinib is predicted to increase the exposure to
  sunitinib. [Moderate] Theoretical → Also see TABLE 15 p. 821 Also see
  TABLE 9 p. 820
- Nilotinib is predicted to increase the concentration of
  tacrolimus. [Severe] Study
- Nilotinib is predicted to increase the exposure to
taxanes (cabazitaxel). [Moderate] Theoretical → Also see TABLE 15 p. 821
- Nilotinib is predicted to increase the concentration of
temsirolimus. [Moderate] Theoretical → Also see TABLE 15 p. 821
- Nilotinib is predicted to increase the exposure to
  tolfurat. Adjust dose. [Moderate] Theoretical
- Nilotinib is predicted to increase the exposure to
trazodone. [Moderate] Theoretical
- Nilotinib is predicted to increase the exposure to
tolrestat. Avoid. [Severe] Study
- Nilotinib is predicted to increase the exposure to
tolvaptan. Avoid. [Severe] Study
- Nilotinib is predicted to increase the exposure to
  ulipristal. Avoid if used for uterine fibroids. [Moderate] Study
- Nilotinib is predicted to increase the exposure to
  venlafaxine. Avoid or adj. venlafaxine dose. [Severe] Study
- Nilotinib is predicted to increase the exposure to
  verapamil. Avoid. [Mild] Study
- Nilotinib is predicted to increase the exposure to
  vinpocetine. Avoid or adj. vinpocetine dose. [Severe] Study
- Nilotinib is predicted to increase the exposure to
  vincristine. Avoid or adj. vincristine dose. [Severe] Study
- Nilotinib is predicted to increase the concentration of
  vinca alkaloids. [Severe] Theoretical → Also see TABLE 9 p. 820 Also see
  TABLE 15 p. 821
- Nilotinib is predicted to increase the exposure to
  zopiclone. Adjust dose. [Mild] Study

Nintedanib

- Antiarhythmics (amiodarone, dronedarone) are predicted to
  increase the exposure to nintedanib. [Moderate] Study
Antiiepileptics (carbamazepine) are predicted to decrease the exposure to nintedanib. [Moderate] Study

Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the exposure to nintedanib. [Moderate] Study

Calcium channel blockers (verapamil) are predicted to increase the exposure to nintedanib. [Moderate] Study

Ciclosporin is predicted to increase the exposure to nintedanib. [Moderate] Study

HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the exposure to nintedanib. [Moderate] Study

Lapatinib is predicted to increase the exposure to nintedanib. [Moderate] Study

Macrolides are predicted to increase the exposure to nintedanib. [Moderate] Study

Ranolazine is predicted to increase the exposure to nintedanib. [Moderate] Study

Rifampicin is predicted to decrease the exposure to nintedanib. [Moderate] Study

St John’s Wort is predicted to decrease the exposure to nintedanib. [Moderate] Study

Vemurafenib slightly increases the exposure to nintedanib. [Moderate] Study

Nitisinone

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to nitisinone. Adjust nitisinone dose. [Moderate] Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to nitisinone. Adjust nitisinone dose. [Moderate] Theoretical

Cobicistat is predicted to increase the exposure to nitisinone. Adjust nitisinone dose. [Moderate] Theoretical

Enzalutamide is predicted to decrease the exposure to nitisinone. Adjust nitisinone dose. [Moderate] Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to nitisinone. Adjust nitisinone dose. [Moderate] Theoretical

Idelalisib is predicted to increase the exposure to nitisinone. Adjust nitisinone dose. [Moderate] Theoretical

Macrolides (clarithromycin) are predicted to increase the exposure to nitisinone. Adjust nitisinone dose. [Moderate] Theoretical

Rifampicin is predicted to decrease the exposure to nitisinone. Adjust nitisinone dose. [Moderate] Theoretical

Nitrates → see TABLE 7 p. 819 (first-dose hypotension), TABLE 8 p. 819 (hypotension)

Pharmacology Drugs with antimuscarinic effects can cause dry mouth, which can reduce the effectiveness of sublingual glyceryl trinitrate tablets.

Nitrates are predicted to increase the risk of methaemoglobinemia when given with topical anaesthetics, local (prilocaine). Avoid. [Severe] Theoretical

Nitrates are predicted to increase the risk of methaemoglobinemia when given with dapsone. [Severe] Theoretical

Nitrates potentially increase the risk of hypotension when given with phosphodiesterase type-5 inhibitors. Avoid. [Severe] Study → Also see TABLE 8 p. 819

Nizatidine increases the clearance of nitrazepam. [Moderate] Study

Nifuroxatantin

Nifuroxatantin is predicted to increase the risk of methaemoglobinemia when given with topical anaesthetics, local (prilocaine). Use with caution or avoid. [Severe] Theoretical

Antacids (magnesium trisilicate) decrease the absorption of nifuroxatantin. [Moderate] Study

Nifuroxatantin is predicted to increase the risk of methaemoglobinemia when given with dapsone. [Severe] Theoretical

Nitrous oxide → see TABLE 8 p. 819 (hypotension), TABLE 11 p. 820 (CNS depressant effects)

Nivolumab → see monoclonal antibodies

Nizatidine → see H2 receptor antagonists

Noradrenaline/norepinephrine → see sympathomimetics, vasoconstrictor

Norethisterone

Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rifampidine, topiramate) are predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Anecdotal

Aprepitant is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Anecdotal

Bosentan is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Anecdotal

Efavirenz is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Anecdotal

Fosaprepitant is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Anecdotal

Griseofulvin potentially decreases the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Anecdotal

HIV-protease inhibitors (ritonavir) are predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Anecdotal

Modafinil is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Anecdotal

Nevirapine is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Anecdotal

Rifaximin is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Anecdotal

Rifampicin is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Anecdotal

St John’s Wort is predicted to decrease the efficacy of norethisterone. Avoid. [Severe] Theoretical

Ulipristal is predicted to decrease the efficacy of norethisterone. Avoid. [Severe] Theoretical

Nortriptyline → see tricyclic antidepressants

NSAIDs → see TABLE 18 p. 822 (hypoaesthesia), TABLE 2 p. 818 (nephrotoxicity), TABLE 16 p. 822 (increased serum potassium), TABLE 4 p. 818 (antiplatelet effects)

route-specific information Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

Celecoxib is predicted to increase the exposure to antiarrhythmics (flecainide, propafenone). Monitor and adjust dose. [Moderate] Theoretical

Antifungals, azoles (fluconazole) moderately increase the exposure to celecoxib. Adjust celecoxib dose. [Moderate] Study

Antifungals, azoles (fluconazole) increase the exposure to parecoxib. Monitor and adjust dose. [Moderate] Study

Antifungals, azoles (voriconazole) slightly increase the exposure to diclofenac. Monitor and adjust dose. [Moderate] Study

Antifungals, azoles (voriconazole) moderately increase the exposure to ibuprofen. Adjust dose. [Moderate] Study

NSAIDs (continued)
- NSAIDs are predicted to increase the risk of gastrointestinal irritation when given with bisphosphonates (alendronic acid, ibandronic acid). (Moderate) Study
- NSAIDs are predicted to increase the risk of renal impairment when given with bisphosphonates (sodium clodronate). (Severe) Theoretical
- Ceritinib is predicted to increase the exposure to NSAIDs (celecoxib, diclofenac). Adjust dose. (Moderate) Theoretical
- Ciclosporin increases the concentration of diclofenac. (Severe) Study → Also see TABLE 2 p. 818 → Also see TABLE 16 p. 822
- Etoricoxib slightly increases the exposure to combined hormonal contraceptives. (Moderate) Study
- NSAIDs increase the risk of gastrointestinal bleeding when given with corticosteroids. (Severe) Theoretical
- NSAIDs increase the risk of renal impairment when given with daptomycin. (Moderate) Theoretical
- Indomethacin increases the concentration of digoxin. (Severe) Study
- Topical dimethyl sulfoxide potentially increases the risk of peripheral neuropathy when given with sulindac. Avoid. (Severe) Anecdotal
- Erlotinib is predicted to increase the risk of gastrointestinal perforation when given with NSAIDs. (Severe) Theoretical
- Etoricoxib slightly increases the exposure to Hormone replacement therapy. (Moderate) Study
- NSAIDs are predicted to increase the risk of gastrointestinal bleeding when given with iron chelators (deferasirox). (Severe) Theoretical
- NSAIDs increase the concentration of lithium. Monitor and adjust lithium (lithium carbonate, lithium citrate) dose. (Severe) Study
- Lurasidone is predicted to decrease the exposure to ibuprofen. Adjust dose. (Moderate) Theoretical
- NSAIDs are predicted to increase the risk of toxicity when given with methotrexate. Monitor and adjust dose. (Severe) Study → Also see TABLE 2 p. 818
- NSAIDs (high-dose) are predicted to decrease the efficacy of mifamurtide. Avoid. (Severe) Theoretical
- Nicorandil is predicted to increase the risk of gastrointestinal perforation when given with NSAIDs. (Severe) Theoretical
- NSAIDs are predicted to increase the exposure to pemetrexed. Use with caution or avoid. (Severe) Theoretical → Also see TABLE 2 p. 818
- NSAIDs potentially increase the risk of seizures when given with quinolones. (Severe) Theoretical
- Regorafenib is predicted to increase the exposure to mefenamic acid. Avoid. (Moderate) Theoretical → Also see TABLE 4 p. 818
- Rifampicin moderately decreases the exposure to NSAIDs (celecoxib, diclofenac, etoricoxib). (Moderate) Study
- NSAIDs increase the risk of acute renal failure when given with thiazide diuretics. (Severe) Theoretical → Also see TABLE 18 p. 822
- Zidovudine increases the risk of haematological toxicity when given with NSAIDs. (Severe) Study → Also see TABLE 2 p. 818

Obinutuzumab → see monoclonal antibodies

Octreotide
- Octreotide decreases the absorption of oral ciclosporin. Adjust ciclosporin dose, p. 496. (Severe) Anecdotal
- Ofatumumab → see monoclonal antibodies
- Ofloxacin → see quinolones
- Olanzapine → see TABLE 8 p. 819 (hypotension), TABLE 15 p. 821 (myelosuppression), TABLE 11 p. 820 (CNS depressant effects)

FOOD AND LIFESTYLE Dose adjustment might be necessary if smoking started or stopped during treatment.

Antiepileptics (carbamazepine) potentially decrease the exposure to olanzapine. Monitor and adjust dose. (Moderate) Study
- Olanzapine is predicted to decrease the effects of dopamine receptor agonists. Avoid. (Moderate) Theoretical → Also see TABLE 8 p. 819
- Olanzapine is predicted to decrease the effects of histamine. Avoid. (Severe) Theoretical → Also see TABLE 8 p. 819
- HIV-protease inhibitors (ritonavir) moderately decrease the exposure to olanzapine. (Moderate) Study
- Olanzapine decreases the effects of levodopa. Avoid or monitor worsening parkinsonian symptoms. (Severe) Anecdotal → Also see TABLE 8 p. 819
- SSRI (fluvoxamine) moderately increase the exposure to olanzapine. Adjust dose. (Severe) Anecdotal
- Olaparib → see TABLE 15 p. 821 (myelosuppression)

FOOD AND LIFESTYLE Bitter (Seville) orange is predicted to increase the exposure to olaparib.

- Antiarrhythmics (dronedarone) are predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose. (Moderate) Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to olaparib. Avoid. (Moderate) Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose. (Moderate) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose. (Moderate) Theoretical
- Aprepitant is predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose. (Moderate) Theoretical
- Bosentan is predicted to decrease the exposure to olaparib. Avoid. (Moderate) Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose. (Moderate) Theoretical
- Cobicistat is predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose. (Moderate) Study
- Crizotinib is predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose. (Moderate) Theoretical
- Deferasirox is predicted to decrease the exposure to olaparib. Avoid or adjust olaparib dose. (Moderate) Study
- Enzalutamide is predicted to decrease the exposure to olaparib. Avoid. (Moderate) Theoretical
- Grapefruit juice is predicted to increase the exposure to olaparib. Avoid. (Moderate) Theoretical
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose. (Moderate) Study
- HIV-protease inhibitors (indinavir) are predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose. (Moderate) Theoretical
- Idenalisib is predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose. (Moderate) Study → Also see TABLE 15 p. 821
- Imatinib is predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose. (Moderate) Theoretical → Also see TABLE 15 p. 821
- Macrolides (clarithromycin) are predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose. (Moderate) Study
- Macrolides (erythromycin) are predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose. (Moderate) Theoretical
- Netupitant is predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose. (Moderate) Theoretical
- Nevirapine is predicted to decrease the exposure to olaparib. Avoid. (Moderate) Theoretical
- Nilotinib is predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose. (Moderate) Theoretical → Also see TABLE 15 p. 821
- Rifampicin is predicted to decrease the exposure to olaparib. Avoid. (Moderate) Theoretical
- St John’s Wort is predicted to decrease the exposure to olaparib. Avoid. (Moderate) Theoretical
- Olmesartan → see angiotensin-II receptor antagonists
- Olsalazine → see TABLE 15 p. 821 (myelosuppression)
- Omalizumab → see monoclonal antibodies
- Ombitasvir
- Antiepileptics (carbamazepine) are predicted to decrease the exposure to ombitasvir. Avoid. (Severe) Theoretical
**Rifampicin** is predicted to decrease the exposure to ombitasvir. Avoid. [Severe] Theoretical

**St John’s Wort** is predicted to decrease the exposure to ombitasvir. Avoid. [Severe] Theoretical

Omega-3 acid ethyl esters → see TABLE 3 p. 818 (anticoagulant effects)

Omeprazole → see proton pump inhibitors

Ondansetron → see TABLE 13 p. 821 (serotonin syndrome), TABLE 9 p. 820 (QT-interval prolongation)

**Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to ondansetron. [Moderate] Study

Dopamine receptor agonists (apomorphine) increase the risk of severe hypotension when given with ondansetron. Avoid. [Severe] Study → Also see TABLE 9 p. 820

Enzalutamide is predicted to decrease the exposure to ondansetron. [Moderate] Study

Rifampicin is predicted to decrease the exposure to ondansetron. [Moderate] Study

Opicapone

Opicapone increases the exposure to levodopa. Adjust levodopa dose. [Moderate] Study

Opicapone is predicted to increase the risk of elevated blood pressure when given with mocllobemide. Avoid. [Severe] Theoretical

Opicapone is predicted to increase the risk of elevated blood pressure when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid. [Severe] Theoretical

Opicapone is predicted to increase the risk of elevated blood pressure when given with monoamine-oxidase B inhibitors (rasagiline, selegiline). [Severe] Theoretical

Opicapone is predicted to increase the risk of cardiovascular side-effects when given with sympathomimetics, inotropic (dobutamine, dopamine). [Severe] Theoretical

Opicapone is predicted to increase the risk of cardiovascular side-effects when given with sympathomimetics, vasoconstrictor (adenaline/epinephrine, noradrenaline/norepinephrine). [Severe] Theoretical

**Opoids** → see TABLE 6 p. 819 (bradycardia), TABLE 13 p. 821 (serotonin syndrome), TABLE 9 p. 820 (QT-interval prolongation), TABLE 11 p. 820 (CNS depressant effects)

**FOOD AND LIFESTYLE** Alcohol has been associated with rapid release of hydromorphone and morphine from extended-release preparations. Avoid alcohol consumption with extended-release preparations.

**Abrisatone** is predicted to decrease the efficacy of tramadol. [Moderate] Study

**Antiarrhythmics (amiodarone)** are predicted to increase the concentration of fentanyl. [Moderate] Theoretical → Also see TABLE 6 p. 819

**Antiarrhythmics (propafenone)** are predicted to decrease the efficacy of tramadol. [Moderate] Study

**Antiarrhythmics (dronedarone)** are predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. [Moderate] Study

**Antiarrhythmics (dronedarone)** are predicted to increase the exposure to opioids (methadone, sufentanil). [Moderate] Theoretical → Also see TABLE 9 p. 820

**Antiarrhythmics (carbamazepine)** decrease the concentration of tramadol. Adjust dose. [Severe] Study

**Antiarrhythmics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to buprenorphine. Monitor and adjust dose. [Moderate] Study

**Antiarrhythmics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to oxycodone. Monitor and adjust dose. [Moderate] Study → Also see TABLE 11 p. 820

**Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to opioids (alfentanil, fentanyl). [Moderate] Study → Also see TABLE 11 p. 820

**Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to methadone. [Moderate] Theoretical → Also see TABLE 9 p. 820

**Antifungals, azoles (miconazole)** are predicted to increase the exposure to enfatani. Use with caution and adjust dose. [Moderate] Study

**Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone, sufentanil). Monitor and adjust dose. [Severe] Study

**Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone, sufentanil). Monitor and adjust dose. [Moderate] Study

**Aprepitant** is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. [Moderate] Study

**Aprepitant** is predicted to increase the exposure to opioids (methadone, sufentanil). [Moderate] Theoretical

**Bosentan** decreases the exposure to methadone. Monitor and adjust dose. [Severe] Study

**Bupropion** is predicted to decrease the efficacy of codeine. [Moderate] Theoretical

**Bupropion** is predicted to decrease the efficacy of tramadol. [Moderate] Theoretical → Also see TABLE 13 p. 821

**Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. [Moderate] Study → Also see TABLE 6 p. 819

**Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to opioids (methadone, sufentanil). [Moderate] Theoretical → Also see TABLE 6 p. 819

**Ceritinib** is predicted to increase the exposure to opioids (alfentanil, fentanyl). Avoid. [Severe] Theoretical

**Cinacalcet** is predicted to decrease the efficacy of codeine. [Moderate] Theoretical

**Cinacalcet** is predicted to decrease the efficacy of tramadol. [Severe] Study

**Cobicistat** is predicted to increase the exposure to methadone. [Moderate] Theoretical

**Cobicistat** is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone, sufentanil). Monitor and adjust dose. [Moderate] Study → Also see TABLE 6 p. 819

**Crizotinib** is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. [Moderate] Study

**Crizotinib** is predicted to increase the exposure to opioids (methadone, sufentanil). [Moderate] Theoretical → Also see TABLE 6 p. 819 → Also see TABLE 9 p. 820

**Duloxetine** is predicted to decrease the efficacy of tramadol. [Moderate] Study → Also see TABLE 13 p. 821

**Efavirenz** decreases the exposure to methadone. Monitor and adjust dose. [Severe] Study

**Enzalutamide** is predicted to decrease the exposure to buprenorphine. Monitor and adjust dose. [Moderate] Theoretical

**Enzalutamide** decreases the exposure to methadone. Monitor and adjust dose. [Severe] Study

**Enzalutamide** is predicted to decrease the exposure to opioids (alfentanil, fentanyl). [Moderate] Study

H₂ receptor antagonists (cimetidine) increase the concentration of alfentanil. Use with caution and adjust dose. [Severe] Study

H₂ receptor antagonists (cimetidine) increase the exposure to fentanyl. [Moderate] Study
Interactions

### Opioids – Oxybuprocaine

**Opioids** (continued)
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to methadone. 
  - **Moderate** Theoretical
  - Also see TABLE 9 p. 820
- HIV-protease inhibitors (ritonavir) are predicted to decrease the concentration of morphine. 
  - **Moderate** Theoretical
- HIV-protease inhibitors (ritonavir) increase the risk of CNS toxicity when given with pethidine. 
  - Avoid. 
  - **Severe** Study
- HIV-protease inhibitors (ritonavir) are predicted to decrease the efficacy of tramadol. 
  - **Moderate** Study
- HIV-protease inhibitors (indinavir) are predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone, sufentanil). 
  - Monitor and adjust dose. 
  - **Severe** Study
- HIV-protease inhibitors (indinavir) are predicted to increase the exposure to opioids (methadone, sufentanil). 
  - **Moderate** Theoretical
- **Irielisib** is predicted to increase the exposure to methadone. 
  - **Moderate** Theoretical
- **Irielisib** is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone, sufentanil).
  - Monitor and adjust dose. 
  - **Severe** Study
- **Imatinib** is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone, sufentanil). 
  - **Moderate** Study
- **Imatinib** is predicted to increase the exposure to opioids (methadone, sufentanil). 
  - **Moderate** Theoretical
- Macrolides (clarithromycin) are predicted to increase the exposure to methadone. 
  - **Moderate** Theoretical
  - Also see TABLE 9 p. 820
- Macrolides (erythromycin) are predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone, sufentanil). 
  - Monitor and adjust dose. 
  - **Moderate** Study
- Macrolides (clarithromycin) are predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone, sufentanil). 
  - Monitor and adjust dose. 
  - **Severe** Study
- Macrolides (erythromycin) are predicted to increase the exposure to opioids (methadone, sufentanil). 
  - **Moderate** Theoretical
- **Mirabeorgen** is predicted to decrease the efficacy of tramadol. 
  - **Moderate** Study
- **Opioids** are predicted to increase the risk of CNS excitation or depression when given with monoamine-oxidase A and B inhibitors, irreversible. 
  - Avoid. 
  - **Severe** Study 
  - Also see TABLE 13 p. 821
- Monoamine-oxidase B inhibitors (rasagiline) are predicted to increase the risk of side-effects when given with pethidine. 
  - Avoid and for 14 days after stopping rasagiline. 
  - **Severe** Theoretical
  - Also see TABLE 13 p. 821
- Monoamine-oxidase B inhibitors (safinamide) are predicted to increase the risk of side-effects when given with pethidine. 
  - Avoid and for 1 week after stopping safinamide. 
  - **Severe** Theoretical
  - Also see TABLE 13 p. 821
- Monoamine-oxidase B inhibitors (selegiline) increase the risk of side-effects when given with pethidine. 
  - Avoid. 
  - **Severe** Anecdotal 
  - Also see TABLE 13 p. 821
- **Nalmefene** is predicted to decrease the efficacy of opioids. 
  - Avoid. 
  - **Severe** Theoretical
- **Netupitant** is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). 
  - Monitor and adjust dose. 
  - **Moderate** Study
- **Netupitant** is predicted to increase the exposure to opioids (methadone, sufentanil). 
  - **Moderate** Theoretical
- **Nevirapine** decreases the exposure to methadone. 
  - Monitor and adjust dose. 
  - **Severe** Study
- **Nilotinib** is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). 
  - Monitor and adjust dose. 
  - **Moderate** Study
- **Nilotinib** is predicted to increase the exposure to opioids (methadone, sufentanil). 
  - **Moderate** Theoretical
  - Also see TABLE 9 p. 820
- **Opioids** (buprenorphine) are predicted to increase the risk of opiate withdrawal when given with opioids (alfentanil). 
  - **Severe** Theoretical
  - Also see TABLE 11 p. 820
- **Opioids** (pentazocine) are predicted to increase the risk of opiate withdrawal when given with opioids (alfentanil, codeine, diamorphine, dihydrocodeine, dipipanone, fentanyl, hydromorphone, meptazinol, methadone, morphine, oxycodone, papaveretum). 
  - **Severe** Theoretical
  - Also see TABLE 13 p. 821 
  - Also see TABLE 11 p. 820
- **Opioids** (buprenorphine, pentazocine) are predicted to increase the risk of opiate withdrawal when given with opioids (pethidine, remifentanil, tapentadol, tramadol). 
  - **Severe** Theoretical
  - Also see TABLE 11 p. 820 
  - Also see TABLE 13 p. 821
- **Opioids** (pentazocine) are predicted to increase the risk of opiate withdrawal when given with opioids (sufentanil). 
  - **Severe** Anecdotal 
  - Also see TABLE 11 p. 820
- **Pallboclib** is predicted to increase the exposure to opioids (alfentanil, fentanyl). 
  - Adjust dose. 
  - **Moderate** Theoretical
- **Pitolisant** is predicted to decrease the exposure to morphine. 
  - **Unknown** Theoretical
- **Rifampicin** is predicted to decrease the exposure to buprenorphine. 
  - Monitor and adjust dose. 
  - **Moderate** Theoretical
- **Rifampicin** decreases the exposure to methadone. 
  - Monitor and adjust dose. 
  - **Severe** Study
- **Rifampicin** is predicted to decrease the exposure to opioids (alfentanil, fentanyl). 
  - **Moderate** Study
- **Rifampicin** decreases the exposure to opioids (codeine, morphine). 
  - **Moderate** Study
- **Rifampicin** is predicted to decrease the exposure to oxycodone. 
  - Monitor and adjust dose. 
  - **Moderate** Study
- **SSRIs** (fluoxetine, paroxetine) are predicted to decrease the efficacy of codeine. 
  - **Moderate** Theoretical
- **SSRIs** (fluoxetine, paroxetine) are predicted to decrease the efficacy of tramadol. 
  - **Severe** Study
  - Also see TABLE 13 p. 821
- **St John’s Wort** decreases the exposure to methadone. 
  - Monitor and adjust dose. 
  - **Severe** Study
  - Also see TABLE 13 p. 821
- **St John’s Wort** moderately decreases the exposure to oxycodone. 
  - Adjust dose. 
  - **Moderate** Study
- **Terbinafine** is predicted to decrease the efficacy of codeine. 
  - **Moderate** Theoretical
- **Terbinafine** is predicted to decrease the efficacy of tramadol. 
  - **Severe** Study

**Orlistat**

**Separation of Administration** Orlistat might affect the absorption of concurrently administered drugs—consider separating administration. Particular care should be taken with antiepileptics, antiretrovirals, and drugs that have a narrow therapeutic index.

**Orphenadrine** 
- Also see TABLE 10 p. 820 (antimuscarinics)

**Osimertinib** 
- Also see TABLE 9 p. 820 (QT-interval prolongation)

**Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to osimertinib. 
- Avoid. 
- **Moderate** Study

**Bosentan** is predicted to decrease the exposure to osimertinib. 
- **Moderate** Theoretical

**Efavirenz** is predicted to decrease the exposure to osimertinib. 
- **Moderate** Theoretical

**Enzalutamide** is predicted to moderately decrease the exposure to osimertinib. 
- **Moderate** Theoretical

**Osimertinib** slightly increases the exposure to statins (rosuvastatin). 
- **Moderate** Study

**Oxalaplatin** 
- Also see platinum compounds

**Oxazepam** 
- Also see TABLE 11 p. 820 (CNS depressant effects)

**Oxcarbazepine** 
- Also see antiepileptics

**Oxprenolol** 
- Also see beta blockers, non-selective

**Oxybuprocaine** 
- Also see anaesthetics, local
Oxybutynin  → see TABLE 10, p. 820 (antimuscarinics)

- Antiarrhythmics (dronedarone) are predicted to increase the exposure to oxybutynin. [Mild] Theoretical
- Oxybutynin potentially increases the risk of overheating and dehydration when given with antiepileptics (zonisamide). Avoid in children. [Severe] Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to oxybutynin. [Mild] Theoretical
- Aprepitant is predicted to increase the exposure to oxybutynin. [Mild] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to oxybutynin. [Mild] Theoretical
- Cobicistat is predicted to increase the exposure to oxybutynin. [Mild] Study
- Crizotinib is predicted to increase the exposure to oxybutynin. [Mild] Theoretical
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to oxybutynin. [Mild] Study
- HIV-protease inhibitors (indinavir) are predicted to increase the exposure to oxybutynin. [Mild] Theoretical
- Idelalisib is predicted to increase the exposure to oxybutynin. [Mild] Study
- Imatinib is predicted to increase the exposure to oxybutynin. [Mild] Theoretical
- Macrolides (clarithromycin) are predicted to increase the exposure to oxybutynin. [Mild] Study
- Macrolides (erythromycin) are predicted to increase the exposure to oxybutynin. [Mild] Theoretical
- Netupitant is predicted to increase the exposure to oxybutynin. [Mild] Study
- Nilotinib is predicted to increase the exposure to oxybutynin. [Mild] Theoretical
- Oxycodeone  → see opioids
- Oxymetholone
  - Oxymetholone increases the anticoagulant effect of coumarins. [Severe] Anecdotal
  - Oxymetholone increases the anticoagulant effect of phenindione. [Severe] Anecdotal
- Oxytetracycline  → see tetracyclines
- Paclitaxel  → see taxanes
- Palbociclib
  - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to palbociclib. Avoid. [Severe] Study
  - Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to palbociclib. Avoid or adjust palbociclib dose. [Severe] Study
  - Palbociclib is predicted to increase the exposure to ciclesonin. Adjust dose. [Moderate] Theoretical
  - Cobicistat is predicted to increase the exposure to palbociclib. Avoid or adjust palbociclib dose. [Severe] Study
  - Enzalutamide is predicted to decrease the exposure to palbociclib. Avoid. [Severe] Study
  - Palbociclib is predicted to increase the exposure to ergotamine. Adjust dose. [Moderate] Theoretical
  - Palbociclib is predicted to increase the exposure to everolimus. In children. [Severe] Theoretical
  - Grapefruit juice is predicted to increase the exposure to palbociclib. Avoid. [Severe] Theoretical
  - HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to palbociclib. Avoid or adjust palbociclib dose. [Severe] Study
  - Idelalisib is predicted to increase the exposure to palbociclib. Avoid or adjust palbociclib dose. [Severe] Study
  - Palbociclib is predicted to increase the exposure to midazolam. [Moderate] Study
  - Palbociclib is predicted to increase the exposure to opioids (alfentanil, fentanyl). Adjust dose. [Moderate] Theoretical
  - Palbociclib is predicted to increase the exposure to pimozide. Adjust dose. [Moderate] Theoretical
  - Rifampicin is predicted to decrease the exposure to palbociclib. Avoid. [Severe] Theoretical
  - Palbociclib is predicted to increase the exposure to sirolimus. Adjust dose. [Moderate] Theoretical
  - St John’s Wort is predicted to decrease the exposure to palbociclib. Avoid. [Severe] Theoretical
  - Palbociclib is predicted to increase the exposure to tacrolimus. Adjust dose. [Moderate] Theoretical
- Paliperidone  → see TABLE 8, p. 819 (hypotension), TABLE 9, p. 820 (QT-interval prolongation), TABLE 11, p. 820 (CNS depressant effects)
- Antiepileptics (carbamazepine) decrease the concentration of paliperidone. Adjust dose. [Moderate] Study
- Paliperidone is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical  → Also see TABLE 8, p. 819  → Also see TABLE 9, p. 820
- Paliperidone is predicted to decrease the effects of levodopa. [Severe] Theoretical  → Also see TABLE 8, p. 819
- Rifampicin is predicted to decrease the exposure to paliperidone. Monitor and adjust paliperidone dose. [Moderate] Theoretical
- Palonosetron  → see TABLE 9, p. 820 (QT-interval prolongation), TABLE 13, p. 821 (serotonin syndrome)
- Dopamine receptor agonists (apomorphine) are predicted to increase the risk of severe hypotension when given with palonosetron. [Severe] Theoretical
- Pamidronate  → see bisphosphonates
- Pancreatin
  - Pancreatin is predicted to decrease the effects of acarbose. Avoid. [Moderate] Theoretical
- Pencuronium  → see neuromuscular blocking drugs, non-depolarising
- Panitumumab  → see monoclonal antibodies
- Panobinostat  → see TABLE 9, p. 820 (QT-interval prolongation), TABLE 15, p. 821 (myelosuppression)

**FOOD AND LIFESTYLE** Avoid pomegranate, pomegranate juice, and star fruit as they are predicted to increase panobinostat exposure.

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to panobinostat. Avoid. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid. [Moderate] Study  → Also see TABLE 9, p. 820
- Panobinostat is predicted to increase the exposure to atomoxetine. Monitor and adjust dose. [Severe] Theoretical
- Panobinostat is predicted to increase the exposure to beta blockers, selective (metoprolol). Monitor and adjust dose. [Moderate] Theoretical
- Cobicistat is predicted to increase the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid. [Moderate] Study  → Also see TABLE 9, p. 820
- Idelalisib is predicted to increase the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid. [Moderate] Study  → Also see TABLE 15, p. 821
- Macrolides (clarithromycin) are predicted to increase the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid. [Moderate] Study  → Also see TABLE 9, p. 820
- Palbociclib is predicted to increase the exposure to pimozide. Avoid. [Severe] Theoretical  → Also see TABLE 9, p. 820
Panobinostat (continued)

- **Rifampicin** is predicted to decrease the exposure to panobinostat. Avoid. [Moderate] Theoretical
- **St John’s Wort** is predicted to decrease the exposure to panobinostat. Avoid. [Moderate] Theoretical
- **Panobinostat** is predicted to increase the exposure to tolterodine. [Moderate] Theoretical → Also see TABLE 9 p. 820

Pantoprazole → see proton pump inhibitors

Papaveretum → see opioids

Paracetamol → see TABLE 1 p. 818 (hepatotoxicity)

**FOOD AND LIFESTYLE** Severe liver damage can occur with chronic alcohol consumption in some alcoholics and persistent heavy drinkers who take only moderate doses of paracetamol.

- **Paracetamol** is predicted to decrease the clearance of alkyllating agents (busulfan). [Moderate] Theoretical
- **Paracetamol** is predicted to increase the risk of methaemoglobinemia when given with topical anaesthetics, local (prilocaine). Use with caution or avoid. [Severe] Theoretical
- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to paracetamol. [Moderate] Study → Also see TABLE 1 p. 818
- **Paracetamol** increases the anticoagulant effect of coumarins. [Severe] Study
- **Paracetamol** is predicted to increase the risk of methaemoglobinemia when given with dapsone. [Severe] Theoretical

**Enzalutamide** is predicted to decrease the exposure to paracetamol. [Moderate] Study

**Imatinib** increases the risk of hepatotoxicity when given with paracetamol. [Severe] Anecdotal

- **Paracetamol** is predicted to increase the anticoagulant effect of phenindione. [Severe] Theoretical
- **Pitolisant** is predicted to decrease the exposure to paracetamol. [Unknown] Theoretical
- **Rifampicin** is predicted to decrease the exposure to paracetamol. [Moderate] Study

**Paraldehyde** → see antiepileptics

**Parecoxib** → see NSAIDs

**Paricalcitol** → see vitamin D substances

**Paritaprevir**

- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. [Severe] Study
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. [Severe] Theoretical
- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to paritaprevir. [Unknown] Theoretical
- **Paritaprevir** is predicted to decrease the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. [Severe] Theoretical
- **Boasentan** is predicted to decrease the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. [Severe] Study
- **Cobicistat** is predicted to increase the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. [Severe] Theoretical
- **Paritaprevir** is predicted to increase the exposure to paritaprevir (with ritonavir and ombitasvir) given with combined hormonal contraceptives. Avoid. [Severe] Study
- **Efavirenz** is predicted to decrease the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. [Severe] Study
- **Enzalutamide** is predicted to decrease the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. [Severe] Study
- **HIV-protease inhibitors** (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. [Severe] Theoretical
- **HIV-protease inhibitors** (indinavir) potentially increase the exposure to paritaprevir. Avoid. [Severe] Theoretical
- **Idelalisib** is predicted to increase the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. [Severe] Theoretical
Pazopanib is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical

Macrolides (clarithromycin) are predicted to increase the exposure to pazopanib. Avoid or adjust pazopanib dose. [Moderate] Study

Macrolides (erythromycin) are predicted to increase the exposure to pazopanib. [Moderate] Theoretical

Netupitant is predicted to increase the exposure to pazopanib. [Moderate] Theoretical

Nilotinib is predicted to increase the exposure to pazopanib. [Moderate] Theoretical

Pegaspargase is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical

Proton pump inhibitors are predicted to decrease the exposure to pazopanib. Avoid or administer concurrently without food. [Moderate] Study

Rifampicin is predicted to decrease the exposure to pazopanib. Avoid. [Severe] Theoretical

Pegasparagase is predicted to increase the risk of hepatotoxicity when given with imatinib. [Severe] Theoretical

Pegasparagase affects the efficacy of methotrexate. [Severe] Anecdotal

Pegasparagase potentially increases the risk of neurotoxicity when given with vincal alkaloids (vincristine). Vincristine should be taken 3 to 24 hours before pegasparagase. [Severe] Anecdotal

Peginterferon alfa → see interferons

Peginterferon beta-1a → see TABLE 15 p. 821 (myelosuppression)

Pembrolizumab → see monoclonal antibodies

Pemetrexed → see TABLE 15 p. 821 (myelosuppression), TABLE 2 p. 818 (nephrotoxicity)

Antimalarials (pyrimethamine) are predicted to increase the risk of side-effects when given with pemetrexed. [Severe] Theoretical

Aspirin (high-dose) potentially increases the exposure to pemetrexed. Use with caution or avoid. [Severe] Theoretical

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with pemetrexed. Public Health England advises avoid. [Severe] Theoretical

NSAIDs are predicted to increase the exposure to pemetrexed. Use with caution or avoid. [Severe] Theoretical

Penicillamine → see TABLE 2 p. 818 (nephrotoxicity)

Antacids decrease the absorption of penicillamine. Separate administration by 2 hours. [Mild] Study

Antimalarials (chloroquine) are predicted to increase the risk of haematological toxicity when given with penicillamine. Avoid. [Severe] Theoretical

Penicillamine potentially decreases the concentration of digoxin. Separate administration by 2 hours. [Severe] Anecdotal

Hydroxychloroquine is predicted to increase the risk of haematological toxicity when given with penicillamine. Avoid. [Severe] Theoretical

Iron (oral) is predicted to decrease the absorption of penicillamine. Separate administration by at least 2 hours. [Mild] Study

Sodium aurothiomalate potentially increases the risk of side-effects when given with penicillamine (in those who have had previous adverse reactions to gold). Avoid. [Severe] Study

Zinc is predicted to decrease the absorption of penicillamine. [Mild] Theoretical

Penicillins

amoxicillin • ampicillin • benzylpenicillin • flucloxacillin • phenoxymethylpenicillin • piperacillin • pivmecillinam • temocillin • ticarcillin

Allopurinol increases the risk of skin rash when given with penicillins (amoxicillin, ampicillin). [Moderate] Study

Penicillins potentially alter the anticoagulant effect of coumarins. Monitor INR and adjust dose. [Severe] Anecdotal

Penicillins are predicted to increase the risk of toxicity when given with methotrexate. [Severe] Theoretical

Piperacillin increases the effects of neuromuscular blocking drugs, non-depolarising. [Moderate] Study

Penicillins are predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical

Piperacillin increases the effects of suxamethonium. [Moderate] Study

Pentamidine → see TABLE 2 p. 818 (nephrotoxicity), TABLE 9 p. 820 (QT-interval prolongation), TABLE 15 p. 821 (myelosuppression)

Didanosine is predicted to increase the risk of pancreatitis when given with pentamidine. Avoid. [Severe] Study

Foscarnet increases the risk of hypocalcaemia when given with pentamidine. [Severe] Anecdotal

Pentazocine → see opioids

Pentostatin → see TABLE 15 p. 821 (myelosuppression), TABLE 5 p. 818 (thromboembolism)

Alkylating agents (cyclophosphamide) (high-dose) increase the risk of toxicity when given with pentostatin. Avoid. [Severe] Anecdotal

Fludarabine increases the risk of pulmonary toxicity when given with pentostatin. Avoid. [Severe] Study

Pentoxifylline → see TABLE 15 p. 821

Pentoxifylline is predicted to increase the concentration of aminophylline. Use with caution or avoid. [Severe] Theoretical

Quinolones (ciprofloxacin) very slightly increase the exposure to pentoxifylline. [Moderate] Study

SSRIs (fluvoxamine) are predicted to increase the exposure to pentoxifylline. [Moderate] Theoretical

Pentoxifylline increases the concentration of theophylline. Monitor and adjust dose. [Severe] Study

Peppermint oil → see TABLE 1 p. 818

Peppermint oil is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical

Perampanel → see antiepileptics

Pergolide → see dopamine receptor agonists

Pericyazine → see phenothiazines

Perindopril → see ACE inhibitors

Perphenazine → see phenothiazines

Pertuzumab → see monoclonal antibodies

Pethidine → see opioids

Phenelzine → see monoamine-oxidase A and B inhibitors, irreversible

Phenindione → see TABLE 3 p. 818 (anticoagulant effects)

Foods and Lifestyle. The effects of phenindione can be reduced or abolished by vitamin K, including that found in health foods, food supplements, enteral feeds, or large amounts of some green vegetables or green tea. Major changes in diet (especially involving salads and vegetables) and in alcohol consumption can affect anticoagulant control.

Antiarrhythmics (propafenone) are predicted to increase the anticoagulant effect of phenindione. Monitor and adjust dose. [Moderate] Theoretical

Antifungals, azoles (miconazole) greatly increase the anticoagulant effect of phenindione. [Severe] Theoretical

Axitinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical

Bosutinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical

Caboctinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical

Cephalosporins (ceftriaxone) potentially increase the risk of bleeding events when given with phenindione. [Severe] Anecdotal

Corticosteroids are predicted to increase the effects of phenindione. [Moderate] Anecdotal

Crizotinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical

Dasatinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical

Disulfiram is predicted to increase the anticoagulant effect of phenindione. [Severe] Theoretical

Enteral feeds (vitamin-K containing) potentially decreases the effects of phenindione. [Severe] Theoretical
Phenothiazines (continued)

- **Erlotinib** is predicted to increase the risk of bleeding events when given with phenindione. (Severe) Theoretical
- **Fibrates** are predicted to increase the anticoagulant effect of phenindione. Monitor INR and adjust dose. (Severe) Study
- **Gefitinib** is predicted to increase the risk of bleeding events when given with phenindione. (Severe) Theoretical
- **H₂ receptor antagonists (cimetidine)** increase the exposure to phenindione. (Severe) Anecdotal
- **Imatinib** is predicted to increase the risk of bleeding events when given with phenindione. (Severe) Theoretical
- **Lapatinib** is predicted to increase the risk of bleeding events when given with phenindione. (Severe) Theoretical
- **Nandrolone** is predicted to increase the anticoagulant effect of phenindione. Monitor and adjust dose. (Severe) Theoretical
- **Nilotinib** is predicted to increase the risk of bleeding events when given with phenindione. (Severe) Theoretical
- **Oxymetholone** increases the anticoagulant effect of phenindione. (Severe) Anecdotal
- **Paracetamol** is predicted to increase the anticoagulant effect of phenindione. (Severe) Theoretical
- **Pazopanib** is predicted to increase the risk of bleeding events when given with phenindione. (Severe) Theoretical
- **Penicillins** are predicted to increase the risk of bleeding events when given with phenindione. (Severe) Theoretical
- **Ponatinib** is predicted to increase the risk of bleeding events when given with phenindione. (Severe) Theoretical
- **Ranibizumab** is predicted to increase the risk of bleeding events when given with phenindione. (Severe) Theoretical
- **Regorafenib** is predicted to increase the risk of bleeding events when given with phenindione. (Severe) Theoretical
- **Ruxolitinib** is predicted to increase the risk of bleeding events when given with phenindione. (Severe) Theoretical
- **Statins (rosuvastatin)** are predicted to increase the anticoagulant effect of phenindione. Monitor INR and adjust dose. (Severe) Theoretical
- **Sunitinib** is predicted to increase the risk of bleeding events when given with phenindione. (Severe) Theoretical
- **Vandetanib** is predicted to increase the risk of bleeding events when given with phenindione. (Severe) Theoretical
- **Vardenafil (sildenafil)** is predicted to increase the risk of bleeding events. (Severe) Theoretical
- **Panobinostat** is predicted to increase the risk of CNS excitation when given with phenothiazines. (Severe) Theoretical
- **Phenindione** and levodopa cause significant hypotensive effects when given with **Phosphodiesterase type-5 inhibitors**. Patient should be stabilised on first drug then second drug should be added at the lowest recommended dose. (Severe) Study → Also see **TABLE 8** p. 819
- **Phenothiazines** decrease the effects of levodopa. Avoid or monitor worsening parkinsonian symptoms. (Severe) Study → Also see **TABLE 8** p. 819
- **Phenothiazines** potentially increase the risk of neurotoxicity when given with lithium. (Severe) Anecdotal → Also see **TABLE 9** p. 820
- **Chlorpromazine** decreases the effects of metyrapone. Avoid. (Moderate) Theoretical
- **Moclobemide** increases the risk of side-effects when given with levoemoprazome. (Moderate) Study
- **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the risk of neuroleptic malignant syndrome when given with phenothiazines. (Severe) Theoretical
- **Panobinostat** is predicted to increase the exposure to perphenazine. Monitor and adjust dose. (Severe) Theoretical
- **SSRIs (paroxetine)** markedly increase the exposure to perphenazine. (Severe) Study

### Phenoxymethylpenicillin → see penicillins

**Phenylephrine** → see sympathomimetics, vasconstrictor

**Phenytoin** → see antiepileptics

**Pholcodine**

- **Pholcodine** is predicted to increase the risk of CNS excitation or depression when given with monoamine-oxidase A and B inhibitors, irreversible. (Severe) Avoid and for 14 days after stopping the MAOI. (Severe) Theoretical

### Phosphodiesterase type-5 inhibitors → see **TABLE 8** p. 819

**alpha blockers** cause significant hypotensive effects when given with phosphodiesterase type-5 inhibitors. Patient should be stabilised on first drug then second drug should be added at the lowest recommended dose. (Severe) Study → Also see **TABLE 8** p. 819

- **Antihypertensives (dronedarone)** are predicted to increase the exposure to **avananifl**. Adjust **avanafil** dose. (Moderate) Theoretical
- **Antihypertensives (dronedarone)** are predicted to increase the exposure to **tadalafil**. Adjust **tadalafil** dose, p. 117. (Moderate) Study → Also see **TABLE 9** p. 820
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (avanafili, tadalafil). Avoid. (Severe) Study
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (sildenafil, vardenafil). (Moderate) Theoretical
- **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **avanafili**. Adjust **avanafil** dose. (Moderate) Theoretical
- **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **sildenafil**. Monitor and adjust **sildenafil** dose, p. 117. (Moderate) Study
- **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **tadalafil**. Adjust **tadalafil** dose, p. 117. (Moderate) Study
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **sildenafil**. Avoid or adjust **sildenafil** dose, p. 117. (Severe) Study → Also see **TABLE 9** p. 820
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **tadalafil**. Use with caution or avoid. (Severe) Study
- **Antifungals, azoles (miconazole)** are predicted to increase the exposure to **sildenafil**. Use with caution and adjust dose. (Severe) Theoretical
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to phosphodiesterase type-5 inhibitors.
Phosphodiesterase type-5 inhibitors – Phosphodiesterase type-5 inhibitors

Interactions

Aprepitant is predicted to increase the exposure to avanafil. Adjust avanafil dose. [Moderate] Theoretical

Aprepitant is predicted to increase the exposure to sildenafil. Monitor and adjust sildenafil dose. p. 117. [Moderate] Study

Aprepitant is predicted to increase the exposure to tadalafil. [Severe] Theoretical

Aprepitant is predicted to increase the exposure to vardenafil. Adjust dose. [Severe] Theoretical

Bosentan decreases the exposure to phosphodiesterase type-5 inhibitors. [Moderate] Study

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to avanafil. Adjust avanafil dose. [Moderate] Theoretical

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to sildenafil. Monitor and adjust sildenafil dose. p. 117. [Moderate] Study → Also see TABLE 8 p. 819

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to tadalafil. [Severe] Theoretical → Also see TABLE 8 p. 819

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to vardenafil. Adjust dose. [Severe] Theoretical

Cobicistat is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil, vardenafil). Avoid. [Severe] Study

Cobicistat is predicted to increase the exposure to sildenafil. Adjust dose. [Severe] Study

Cobicistat is predicted to increase the exposure to tadalafil. Use with caution or avoid. [Severe] Study

Cobicistat is predicted to increase the exposure to vardenafil. Adjust dose. [Severe] Study

Efavirenz is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors. [Moderate] Theoretical

Enalapril decreases the exposure to phosphodiesterase type-5 inhibitors (sildenafil, vardenafil). [Moderate] Theoretical

Enalapril moderately decreases the exposure to phosphodiesterase type-5 inhibitors. [Moderate] Study

Grapefruit juice is predicted to increase the exposure to phosphodiesterase type-5 inhibitors. Use with caution or avoid. [Moderate] Study

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil, vardenafil). Avoid. [Severe] Study → Also see TABLE 9 p. 820

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to sildenafil. Avoid or adjust sildenafil dose. p. 117. [Severe] Study → Also see TABLE 9 p. 820

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to tadalafil. Use with caution or avoid. [Severe] Study

HIV-protease inhibitors (indinavir) are predicted to increase the exposure to avanafil. Adjust avanafil dose. [Moderate] Theoretical

HIV-protease inhibitors (indinavir) are predicted to increase the exposure to sildenafil. Monitor and adjust sildenafil dose. p. 117. [Moderate] Study

HIV-protease inhibitors (indinavir) are predicted to increase the exposure to tadalafil. [Moderate] Theoretical

IDELALISIB is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil, vardenafil). Avoid. [Severe] Study

IDELALISIB is predicted to increase the exposure to sildenafil. Avoid or adjust sildenafil dose. p. 117. [Severe] Study

IDELALISIB is predicted to increase the exposure to tadalafil. Use with caution or avoid. [Severe] Study

Imatinib is predicted to increase the exposure to avanafil. Adjust avanafil dose. [Moderate] Theoretical

Imatinib is predicted to increase the exposure to sildenafil. Monitor and adjust sildenafil dose. p. 117. [Moderate] Study

Imatinib is predicted to increase the exposure to tadalafil. [Severe] Theoretical

Imatinib is predicted to increase the exposure to vardenafil. Adjust dose. [Severe] Theoretical

Macrolides (clarithromycin) are predicted to increase the exposure to sildenafil. Avoid or adjust sildenafil dose. p. 117. [Severe] Study → Also see TABLE 9 p. 820

Macrolides (clarithromycin) are predicted to increase the exposure to tadalafil. [Severe] Theoretical

Macrolides (erythromycin) are predicted to increase the exposure to avanafil. Adjust avanafil dose. [Moderate] Theoretical

Macrolides (erythromycin) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil, vardenafil). Avoid. [Severe] Study → Also see TABLE 9 p. 820

Netupitant is predicted to increase the exposure to avanafil. Adjust avanafil dose. [Moderate] Theoretical

Netupitant is predicted to increase the exposure to sildenafil. Monitor and adjust sildenafil dose, p. 117. [Moderate] Study

Netupitant is predicted to increase the exposure to tadalafil. [Severe] Theoretical

Netupitant is predicted to increase the exposure to vardenafil. Adjust dose. [Severe] Theoretical

Nikonidil is predicted to increase the risk of hypotension when given with phosphodiesterase type-5 inhibitors. [Moderate] Theoretical

Nicorandil is predicted to increase the risk of hypotension when given with phosphodiesterase type-5 inhibitors. Avoid. [Severe] Theoretical → Also see TABLE 8 p. 819

Nilotinib is predicted to increase the exposure to avanafil. Adjust avanafil dose. [Moderate] Theoretical

Nilotinib is predicted to increase the exposure to vardenafil. Adjust dose. [Severe] Theoretical

Nitrites potentially increase the risk of hypotension when given with phosphodiesterase type-5 inhibitors. Avoid. [Severe] Study → Also see TABLE 8 p. 819

RIFAMPICIN is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (avanafil, tadalafil). Avoid. [Severe] Study

RIFAMPICIN is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (sildenafil, vardenafil). [Moderate] Theoretical

Riociguat is predicted to increase the risk of hypotension when given with phosphodiesterase type-5 inhibitors. Avoid. [Severe] Theoretical → Also see TABLE 8 p. 819

Riociguat is predicted to increase the risk of hypotension when given with phosphodiesterase type-5 inhibitors. Avoid. [Severe] Theoretical → Also see TABLE 8 p. 819

St John’s Wort is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors. [Moderate] Theoretical
Pilocarpine

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

Pimecrolimus

FOOD AND LIFESTYLE Risk of facial flushing and skin irritation with alcohol consumption.

- **Pimecrolimus** is predicted to decrease the efficacy of **mifamurtide**. Avoid. [Severe] Theoretical
- **Pimoide** → see TABLE 8 p. 819 (hypotension), TABLE 9 p. 820 (QT-interval prolongation), TABLE 11 p. 820 (CNS depressant effects), TABLE 10 p. 820 (antimuscarinics)
- **Antihypertensives (dronedarone)** are predicted to increase the exposure to **pimoide**. Avoid. [Severe] Theoretical
- **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **pimoide**. Avoid. [Severe] Theoretical
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **pimoide**. Avoid. [Severe] Theoretical
- **Aprepitant** is predicted to increase the exposure to **pimoide**. Avoid. [Severe] Theoretical
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **pimoide**. Avoid. [Severe] Theoretical
- **Aripiprazole** is predicted to increase the exposure to **pimoide**. Avoid. [Severe] Theoretical
- **Pimozide** is predicted to increase the exposure to **pimoide**. Avoid. [Severe] Theoretical
- **Grapefruit juice** increases the exposure to **pimoide**. Avoid. [Severe] Theoretical
- **Antihyperglycemics (pioglitazone)** are predicted to increase the exposure to **pimoide**. Avoid. [Severe] Theoretical
- **Antithrombotics (dabigatran)** are predicted to increase the exposure to **pimoide**. Avoid. [Severe] Theoretical
- **Antihistamines, sedating** are predicted to increase the exposure to **pimoide**. Avoid. [Severe] Theoretical
- **Aprepitant** is predicted to increase the exposure to **pimoide**. Avoid. [Severe] Theoretical

Piperaquine

- **Piperacillin** → see penicillins
- **Piperaquine** → see antimalarials

Pirfenidone

FOOD AND LIFESTYLE Smoking increases pirfenidone clearance; patients should be encouraged to stop smoking before and during treatment with pirfenidone.

- **Antiepileptics (fosphenytoin, phenytoin)** are predicted to decrease the exposure to **pirfenidone**. Avoid. [Moderate] Theoretical
- **Combined hormonal contraceptives** are predicted to increase the exposure to **pirfenidone**. Use with caution and adjust dose. [Moderate] Study
- **HIV-protease inhibitors (ritonavir)** are predicted to decrease the exposure to **pirfenidone**. Avoid. [Moderate] Theoretical
- **Quinolones (ciprofloxacin)** are predicted to increase the exposure to **pirfenidone**. Use with caution and adjust dose. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to **pirfenidone**. Avoid. [Moderate] Theoretical
- **SSRIs (fluvoxamine)** are predicted to moderately increase the exposure to **pirfenidone**. Avoid. [Moderate] Study
- **Piroxicam** → see NSAIDs

Pitolisant

- **Abiraterone** is predicted to increase the exposure to **pitolisant**. Use with caution and adjust dose. [Moderate] Study
- **Antihypertensives (propafenone)** are predicted to increase the exposure to **pitolisant**. Use with caution and adjust dose. [Moderate] Study
- **Antithrombotics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to moderately decrease the exposure to **pitolisant**. [Moderate] Study
- **Antihistamines, sedating** are predicted to decrease the efficacy of **pitolisant**. [Unknown] Theoretical
- **Pitolisant** is predicted to decrease the exposure to **bosutinib**. Avoid. [Severe] Theoretical
- **Bupropion** is predicted to moderately increase the exposure to **pitolisant**. Use with caution and adjust dose. [Moderate] Study
- **Pitolisant** is predicted to decrease the exposure to **ciclosporin**. Avoid. [Severe] Theoretical
- **Antithrombotics (indinavir)** are predicted to increase the exposure to **pitolisant**. Avoid. [Severe] Theoretical
- **Idelalisib** is predicted to increase the exposure to **pitolisant**. Avoid. [Severe] Study
- **Imatinib** is predicted to increase the exposure to **pitolisant**. Avoid. [Severe] Theoretical
- **Pimoide** is predicted to decrease the effects of **levodopa**. [Severe] Theoretical
- **Macrolides (clarithromycin)** are predicted to increase the exposure to **pimoide**. Avoid. [Severe] Study → Also see TABLE 9 p. 820
- **Macrolides (erythromycin)** are predicted to increase the exposure to **pimoide**. Avoid. [Severe] Theoretical
- **Netupitant** is predicted to increase the exposure to **pimoide**. Avoid. [Severe] Theoretical
- **Nilotinib** is predicted to increase the exposure to **pimoide**. Avoid. [Severe] Theoretical
- **Panobinostat** is predicted to increase the exposure to **pimoide**. Avoid. [Severe] Theoretical
- **Pitolisant** is predicted to decrease the exposure to **pimoide**. Avoid. [Severe] Theoretical

Pindolol → see beta blockers, non-selective

Pioglitazone → see TABLE 14 p. 821 (antidiabetic drugs)

- **Clonidine** is predicted to increase the exposure to **pioglitazone**. [Severe] Theoretical
- **Fibrates (gemfibrozil)** markedly increase the exposure to **pioglitazone**. Monitor blood glucose and adjust dose. [Severe] Study
- **Rifampicin** moderately decreases the exposure to **pioglitazone**. Monitor and adjust **pioglitazone** dose. [Moderate] Study
- **St John’s Wort** slightly decreases the exposure to **pioglitazone**. [ Mild] Study

Piperacillin → see penicillins

Palbociclib is predicted to decrease the exposure to **everolimus**. Avoid. [Severe] Theoretical

**HIV-protease inhibitors (ritonavir)** are predicted to increase the exposure to **pitolisant**. Use with caution and adjust dose. [Moderate] Study

**Pitolisant** is predicted to decrease the exposure to **irinotecan**. [Unknown] Theoretical

**Pitolisant** is predicted to increase the exposure to **metformin**. [Unknown] Theoretical
- **Mianserin** is predicted to decrease the efficacy of **pitolisant.**
  - Unknown: Theoretical
- **Mirabegron** is predicted to increase the exposure to **pitolisant.**
  - Use with caution and adjust dose. [Moderate Study]
- **Mirtazapine** is predicted to decrease the efficacy of **pitolisant.**
  - Unknown: Theoretical
- **Pitolisant** is predicted to decrease the exposure to **opioids (morphine).**
  - Unknown: Theoretical
- **Pitolisant** is predicted to decrease the exposure to **pimozide.**
  - Avoid. [Severe: Theoretical]
- **Pitolisant** is predicted to decrease the exposure to **repaglinide.**
  - Unknown: Theoretical
- **Rifampicin** is predicted to moderately decrease the exposure to **pitolisant.**
  - [Moderate Study]
- **Pitolisant** is predicted to decrease the exposure to **sirolimus.**
  - Avoid. [Severe: Theoretical]
- **SSRIs (fluoxetine, paroxetine)** are predicted to moderately increase the exposure to **pitolisant.**
  - Use with caution and adjust dose. [Moderate Study]
- **St John’s Wort** is predicted to decrease the exposure to **pitolisant.**
  - Monitor and adjust dose. [Moderate Theoretical]
- **Terbinafine** is predicted to moderately increase the exposure to **pitolisant.**
  - Use with caution and adjust dose. [Moderate Study]
- **Tricyclic antidepressants** are predicted to decrease the efficacy of **pitolisant.**
  - [Rif: Theoretical]
- **Pimecrolimus** is predicted to decrease the absorption of **tacrolimus.**
  - Avoid. [Severe: Theoretical]
- **Pizotifen** → see antihistamines, sedating

### Interactions

- **Polymyxins → see TABLE 2 p. 818 (nephrotoxicity), TABLE 19 p. 822 (ototoxicity), TABLE 12 p. 821 (peripheral neuropathy)**
- **Carboxatin** - *cislipatin* - *oxaliplatin*
- **Cisplatin** increases the risk of pulmonary toxicity when given with **bleomycin.**
  - [Severe: Study] Also see TABLE 15 p. 821
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **platinum compounds.**
  - Public Health England advises avoid. [Severe: Theoretical]

### Polyoxymyxins

- **Antacids** increase the risk of metabolic alkalosis when given with **polystyrene sulfonate.** [Severe: Anecdotal]
- **Polystyrene sulfonate** is predicted to decrease the absorption of **levethroxyine.** Separate administration by at least 4 hours. [Moderate: Theoretical]

### Polyoxymyxins

- **Polysaccharide-iron complex → see iron (oral)**
- **Polystyrene sulfonate**
  - **Antacids** increase the risk of metabolic alkalosis when given with **polystyrene sulfonate.** [Severe: Anecdotal]
  - **Polystyrene sulfonate** is predicted to decrease the absorption of **levethroxyine.** Separate administration by at least 4 hours. [Moderate: Theoretical]

### Polyoxymyxins

- **Pomalidomide → see TABLE 15 p. 821 (myelosuppression), TABLE 5 p. 818 (thromboembolism)**
  - **Combined hormonal contraceptives** are predicted to increase the risk of venous thromboembolism when given with **pomalidomide.**
  - Avoid. [Severe: Theoretical]
- **Hormone replacement therapy** is predicted to increase the risk of venous thromboembolism when given with **pomalidomide.**
  - [Severe: Theoretical]
- **Quinolones (ciprofloxacin)** are predicted to increase the exposure to **pomalidomide.** Adjust **pomalidomide** dose. [Moderate: Theoretical]
- **SSRIs (fluvoxamine)** moderately increase the exposure to **pomalidomide.** Adjust **pomalidomide** dose. [Moderate: Study]

### Pitolisant

- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **pitolisant.**
  - Avoid. [Moderate: Theoretical]
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to slightly increase the exposure to **pitolisant.**
  - Monitor and adjust **pitolisant** dose. [Moderate: Study]
- **Cobicistat** is predicted to slightly increase the exposure to **pitolisant.** Monitor and adjust **pitolisant** dose. [Moderate: Study]
- **Pitolisant** is predicted to increase the risk of bleeding events when given with **coumarins.** [Severe: Theoretical]
- **Enalaprilatide** is predicted to decrease the exposure to **pitolisant.** Avoid. [Moderate: Theoretical]
- **Grapefruit juice** is predicted to increase the exposure to **pitolisant.** [Moderate: Theoretical]
- **HIV- protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to slightly increase the exposure to **pitolisant.**
  - Monitor and adjust **pitolisant** dose. [Moderate: Study]
- **Idelalisib** is predicted to slightly increase the exposure to **pitolisant.** Monitor and adjust **pitolisant** dose. [Moderate: Study]
- **Macrolides (clarithromycin)** are predicted to slightly increase the exposure to **pitolisant.**
  - Monitor and adjust **pitolisant** dose. [Moderate: Study]
- **Rifampicin** is predicted to increase the risk of bleeding events when given with **phenindione.** [Severe: Theoretical]
- **Rifampicin** is predicted to decrease the exposure to **pitolisant.** Avoid. [Moderate: Theoretical]
- **St John’s Wort** is predicted to decrease the exposure to **pitolisant.** Avoid. [Severe: Theoretical]
- **Posaconazole → see antifungals, azoles**
- **Potassium carbenate → see TABLE 16 p. 822 (increased serum potassium)**
- **Potassium citrate**
  - **Potassium citrate** is predicted to decrease the efficacy of **methenamine.** Avoid. [Moderate: Theoretical]
  - **Potassium citrate** increases the risk of side-effects when given with **sucralfate.** Avoid. [Moderate: Theoretical]
- **Potassium-sparing diuretics → see TABLE 18 p. 822 (hyponatraemia), TABLE 16 p. 822 (increased serum potassium)**

### OTHERS

- **Amitriptyline + triamterene** potentially increases the clearance of **lithium.**
  - [Moderate: Study]
- **Pramipexole → see dopamine receptor agonists**
- **Prasugrel → see TABLE 4 p. 818 (antiplatelet effects)**
- **Prazosin → see antihistamines, sedating**
- **Praziquantel**
  - **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to markedly decrease the exposure to **praziquantel.**
  - Avoid. [Moderate: Study]
  - **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to moderately increase the exposure to **praziquantel.**
  - [Mild: Study]
  - **Antimalarials (chloroquine)** moderately decrease the exposure to **praziquantel.**
  - Use with caution and adjust dose. [Moderate: Study]
- **Prazosin** is predicted to moderately increase the exposure to **praziquantel.**
  - [Mild: Study]
- **Corticosteroids (dexamethasone)** decrease the exposure to **praziquantel.**
  - [Moderate: Study]
- **Enalaprilatide** is predicted to markedly decrease the exposure to **praziquantel.**
  - Avoid. [Moderate: Study]
- **Grapefruit juice** is predicted to increase the exposure to **praziquantel.**
  - [Moderate: Study]
- **H2 receptor antagonists (cimetidine)** moderately increase the exposure to **praziquantel.**
  - [Moderate: Study]
- **HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to moderately increase the exposure to **praziquantel.**
  - [Mild: Study]
- **Idelalisib** is predicted to moderately increase the exposure to **praziquantel.**
  - [Mild: Study]
- **Macrolides (clarithromycin)** are predicted to moderately increase the exposure to **praziquantel.**
  - [Mild: Study]
- **Ponatinib** is predicted to markedly decrease the exposure to **praziquantel.**
  - Avoid. [Moderate: Study]
- **Prednisone → see corticosteroids**
- **Prednisolone → see corticosteroids**
- **Pregabalin → see antiepileptics**
- **Prilocaine → see anaesthetics, local**
- **Pristamine → see antimalarials**
**Primodone** → see antiepileptics

**Procarbazine** → see TABLE 15 p. 821 (myelosuppression), TABLE 13 p. 821 (serotonin syndrome)

**FOOD AND LIFESTYLE** Procarbazine is a mild monoamine-oxidase inhibitor and might rarely interact with tyramine-rich foods (such as mature cheese, salami, pickled herring, Bovril®, Oxo®, Marmite® or any similar meat or yeast extract or fermented soybean extract, and some beers, lagers or wines). Alcohol consumption can cause a disulfiram-like reaction.

- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) potentially increase the risk of hypersensitivity reactions when given with procarbazine. [Severe] Anecdotal
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with procarbazine. Public Health England advises avoid. [Severe] Theoretical

**Prochlorperazine** → see phenothiazines

**Procyclinide** → see TABLE 10 p. 820 (antimucasinics)

- SSRI (paroxetine) slightly increase the exposure to procyclinide. Monitor and adjust procyclinide dose. [Moderate] Study

**Proguanil** → see antimalarials

**Promazine** → see phenothiazines

**Promethazine** → see antihistamines, sedating

**Propafenone** → see antiarrhythmics

**Propantheline** → see TABLE 10 p. 820 (antimucasinics)

- Propranolol is predicted to slightly to moderately increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical

**Propofol** → see TABLE 8 p. 819 (hypotension), TABLE 11 p. 820 (CNS depressant effects)

**Propranolol** → see beta blockers, non-selective

**Propylthiouracil** → see antimalarials

**Proton pump inhibitors**

- esomeprazole, lansoprazole, omeprazole, pantoprazole, rabeprazole

  - **Antifungals**, azoles (fluconazole) are predicted to increase the exposure to proton pump inhibitors. [Mild] Study
  - **Antifungals**, azoles (itraconazole) increase the exposure to proton pump inhibitors (esomeprazole, omeprazole). Adjust dose. [Moderate] Study
  - **Proton pump inhibitors** decrease the absorption of antifungals, azoles (itraconazole). Administer itraconazole capsules with an acidic beverage. [Moderate] Study
  - **Proton pump inhibitors** decrease the absorption of antifungals, azoles (ketoconazole). Administer ketoconazole with an acidic beverage. [Moderate] Study
  - **Proton pump inhibitors** decrease the absorption of antifungals, azoles (posaconazole) (oral suspension). Avoid. [Moderate] Study
  - **Proton pump inhibitors** are predicted to decrease the absorption of bosutinib. [Moderate] Study
  - **Proton pump inhibitors** are predicted to decrease the absorption of certitinib. [Moderate] Theoretical
  - **Esomeprazole** is predicted to increase the exposure to cilostazol. [Moderate] Theoretical
  - **Omeprazole** is predicted to increase the exposure to cilostazol. Adjust cilostazol dose. [Moderate] Study
  - **Proton pump inhibitors** (esomeprazole, omeprazole) are predicted to decrease the efficacy of clopidogrel. Avoid. [Moderate] Study
  - **Proton pump inhibitors** are predicted to decrease the exposure to dabrafenib. Avoid. [Severe] Theoretical
  - **Proton pump inhibitors** are predicted to slightly to moderately decrease the exposure to dasatinib. Avoid. [Severe] Study
  - **Proton pump inhibitors** are predicted to decrease the absorption of dipyriramole (immediate release tablets). [Moderate] Theoretical

  - **Enzalutamide** is predicted to moderately decrease the exposure to omeprazole. [Moderate] Study
  - **Proton pump inhibitors** are predicted to slightly decrease the exposure to erlotinib. Avoid. [Moderate] Study
  - **Proton pump inhibitors** are predicted to decrease the exposure to gefitinib. [Severe] Theoretical
  - **Proton pump inhibitors** decrease the exposure to HIV-1 protease inhibitors (atazanavir). Avoid or adjust dose. [Severe] Study
  - **Proton pump inhibitors** increase the exposure to HIV-1 protease inhibitors (saquinavir). Avoid. [Severe] Study
  - **HIV-1 protease inhibitors** (tipranavir) decrease the exposure to proton pump inhibitors. Avoid. [Severe] Study
  - **Proton pump inhibitors** are predicted to decrease the exposure to ledipasvir. Adjust dose, see sofosbuvir with ledipasvir. [Moderate] Theoretical
  - **Lumacaftor** is predicted to decrease the exposure to proton pump inhibitors (esomeprazole, lansoprazole, omeprazole). Adjust dose. [Moderate] Theoretical
  - **Proton pump inhibitors** decrease the clearance of methotrexate. Use with caution or avoid. [Severe] Study
  - **Proton pump inhibitors** are predicted to decrease the exposure to pazopanib. Avoid or administer concurrently without food. [Moderate] Study
  - **Rifampicin** is predicted to moderately decrease the exposure to omeprazole. [Moderate] Study
  - **Proton pump inhibitors** are predicted to decrease the exposure to rilpivirine. Avoid. [Severe] Study
  - **Proton pump inhibitors** potentially decrease the exposure to sofosbuvir. Adjust dose, see sofosbuvir with ledipasvir and sofosbuvir with velpatasvir. [Moderate] Study
  - **SSRs (fluvoxamine)** are predicted to increase the exposure to proton pump inhibitors. [Mild] Study
  - **Esomeprazole** is predicted to slightly to moderately increase the exposure to SSRIs (citalopram, escitalopram). Monitor and adjust dose. [Severe] Theoretical
  - **Omeprazole** slightly to moderately increases the exposure to SSRIs (citalopram, escitalopram). Monitor and adjust dose. [Severe] Study
  - **Proton pump inhibitors** are predicted to decrease the concentration of velpatasvir. Adjust dose, see sofosbuvir with velpatasvir. [Moderate] Study

**Proxymetacaine** → see anaesthetics, local

**Pseudoephedrine** → see sympathomimetics, vasoconstrictor

**Pyrazinamide**

- **Allopurinol** is predicted to increase the risk of hyperuricaemia when given with pyrazinamide. [Moderate] Theoretical
- **Pyrazinamide** is predicted to decrease the effects of sulfinpyrazone. [Moderate] Theoretical

**Pyridostigmine** → see TABLE 6 p. 819 (bradycardia), TABLE 20 p. 822 (neuromuscular blocking effects)

- **Aminoglycosides** are predicted to decrease the effects of pyridostigmine. [Moderate] Theoretical Also see TABLE 20 p. 822

**Pyrimethamine** → see antimalarials

**Quetiapine** → see TABLE 8 p. 819 (hypotension), TABLE 11 p. 820 (CNS depressant effects)

- **Antiarhythmics** (dronedaron) are predicted to increase the exposure to quetiapine. Avoid. [Moderate] Study
- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to quetiapine. [Moderate] Study Also see TABLE 11 p. 820
- **Antifungals**, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to quetiapine. Avoid. [Moderate] Study
- **Antifungals**, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to quetiapine. Avoid. [Severe] Study
- **Aprepitant** is predicted to increase the exposure to quetiapine. Avoid. [Moderate] Study
- **Calcium channel blockers** (diltiazem, verapamil) are predicted to increase the exposure to quetiapine. Avoid. [Moderate] Study Also see TABLE 8 p. 819
- **Cobicistat** is predicted to increase the exposure to quetiapine. Avoid. [Severe] Study
- **Crizotinib** is predicted to increase the exposure to quetiapine. Avoid. [Moderate] Study
Quetiapine is predicted to decrease the effects of dopamine receptor agonists. Avoid, [Moderate] Theoretical → Also see TABLE 8 p. 819

Enzalutamide is predicted to decrease the exposure to quetiapine. [Moderate] Study
Grapefruit juice is predicted to increase the exposure to quetiapine. Avoid, [Severe] Theoretical
Quetiapine is predicted to decrease the effects of histamine. Avoid, [Severe] Theoretical → Also see TABLE 8 p. 819
HIV-protase inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to quetiapine. Avoid, [Severe] Study
HIV-protase inhibitors (indinavir) are predicted to increase the exposure to quetiapine. Avoid, [Moderate] Study
Idelalisib is predicted to increase the exposure to quetiapine. Avoid, [Severe] Study
Imatinib is predicted to increase the exposure to quetiapine. Avoid, [Moderate] Study
Quetiapine decreases the effects of levodopa. [Severe] Anecdotal → Also see TABLE 8 p. 819
Quetiapine potentially increases the risk of neurotoxicity when given with lithium. [Severe] Anecdotal
Macrolides (clarithromycin) are predicted to increase the exposure to quetiapine. Avoid, [Severe] Study
Macrolides (erythromycin) are predicted to increase the exposure to quetiapine. Avoid, [Moderate] Study
Netupitant is predicted to increase the exposure to quetiapine. Avoid, [Moderate] Study
Nilotinib is predicted to increase the exposure to quetiapine. Avoid, [Moderate] Study
Rifampicin is predicted to decrease the exposure to quetiapine. [Moderate] Study
Quinagolide → see dopamine receptor antagonists
Quinapril → see ACE inhibitors
Quinine → see antimalarials
Quinolones → see TABLE 9 p. 820 (QT-interval prolongation)
ciprofloxacin - levofloxacin - moxifloxacin - nalidixic acid - norfloxacin - ofloxacin
ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

Ciprofloxacin is predicted to increase the exposure to agomelatine. [Moderate] Study
Quinolones (ciprofloxacin, norfloxacin) are predicted to increase the exposure to aminophylline. Adjust dose. [Moderate] Theoretical
Ciprofloxacin is predicted to increase the exposure to anagrelide. [Moderate] Theoretical
Antacids decrease the absorption of quinolones. Quinolones should be taken 2 hours before or 4 hours after antacids. [Moderate] Study
Ciprofloxacin slightly increases the exposure to antiarrhythmics (lidocaine). [MI] Study
Ciprofloxacin affects the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Severe] Study
Aspirin (high-dose) potentially increases the risk of seizures when given with quinolones. [Severe] Theoretical
Calcium salts (calcium carbonate) decrease the absorption of norfloxacin. Norfloxacin should be taken 2 hours before or 4 hours after calcium carbonate. [Moderate] Study
Calcium salts (calcium carbonate) decrease the absorption of quinolones (ciprofloxacin, nalidixic acid). Separate administration by 2 hours. [Moderate] Study
Ciprofloxacin increases the concentration of clozapine. Monitor side effects and adjust dose. [Severe] Study
Quinolones increase the anticoagulant effect of coumarins. [Severe] Anecdotal
Didanosine (buffered) is predicted to greatly decrease the exposure to oral quinolones. Didanosine should be taken 2 hours after quinolones. [Moderate] Study
Ciprofloxacin is predicted to increase the exposure to dopamine receptor agonists (ropinirole). Adjust dose. [Moderate] Study
Ciprofloxacin is predicted to increase the exposure to duloxetine. Avoid, [Moderate] Theoretical
Enteral feeds decreases the exposure to ciprofloxacin. [Moderate] Study
Ciprofloxacin slightly increases the exposure to erlotinib. Monitor side effects and adjust dose. [Moderate] Study
Ciprofloxacin is predicted to increase the exposure to ibrutinib. Avoid or adjust ibrutinib dose. [Severe] Theoretical
Iron (oral) decreases the exposure to quinolones. Separate administration by at least 2 hours. [Moderate] Study
Lanthanum moderately decreases the exposure to quinolones. Quinolones should be taken 2 hours before or 4 hours after lanthanum. [Moderate] Study
Ciprofloxacin is predicted to increase the exposure to toloxapine. Avoid, [Unknown] Theoretical
Ciprofloxacin is predicted to increase the exposure to melatonin. [Moderate] Theoretical
Ciprofloxacin potentially increases the risk of toxicity when given with methotrexate. Avoid. [Severe] Anecdotal
Ciprofloxacin slightly increases the exposure to monoamine-oxidase B inhibitors (rasagiline). [Moderate] Study
NSAIDs potentially increase the risk of seizures when given with quinolones. [Severe] Theoretical
Ciprofloxacin very slightly increases the exposure to pentoxifylline. [Moderate] Study
Ciprofloxacin is predicted to increase the exposure to pirfenidone. Use with caution and adjust dose. [Moderate] Study
Ciprofloxacin is predicted to increase the exposure to pomalidomide. Adjust pomalidomide dose. [Moderate] Theoretical
Ciprofloxacin is predicted to increase the exposure to roflumilast. [Moderate] Theoretical
Strontium ranelate is predicted to decrease the absorption of quinolones. Avoid, [Moderate] Theoretical
Sucralfate decreases the exposure to quinolones. Separate administration by 2 hours. [Moderate] Study
Ciprofloxacin is predicted to increase the exposure to theophylline. Monitor and adjust dose. [Moderate] Theoretical
Norfloxacin is predicted to increase the exposure to theophylline. Adjust dose. [Moderate] Anecdotal
Ciprofloxacin increases the exposure to tizanidine. Avoid. [Moderate] Study
Zinc is predicted to decrease the exposure to quinolones. Separate administration by 2 hours. [Moderate] Study
Ciprofloxacin is predicted to increase the exposure to zolmitriptan. Adjust zolmitriptan dose, p. 280. [Moderate] Theoretical
Rabeprazole → see proton pump inhibitors
Rabies vaccine
Antimalarials (chloroquine) decrease the efficacy of rabies vaccine. Avoid. [Moderate] Study
Hydroxychloroquine is predicted to decrease efficacy rabies vaccine. [Moderate] Theoretical
Raloxifene → see TABLE 5 p. 818 (thromboembolism)
Raltegravir
Antacids slightly decrease the exposure to raltegravir. Avoid. [Moderate] Study
HIV-protase inhibitors (darunavir) increase the risk of rash when given with raltegravir. [Moderate] Study
HIV-protase inhibitors (fosamprenavir) boosted with ritonavir decrease the exposure to raltegravir and raltegravir decreases the exposure to HIV-protase inhibitors (fosamprenavir) boosted with ritonavir. Avoid. [Severe] Study
Rifampicin slightly decreases the exposure to raltegravir. Avoid or adjust dose. [Moderate] Study
Raltitrexed → see TABLE 15 p. 821 (myelosuppression)
Folates (folic acid) are predicted to alter the effects of raltitrexed. Avoid. [Moderate] Theoretical
Folates (folic acid) alter the effects of raltitrexed. Avoid. [Moderate] Study
Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with raltitrexed. Public Health England advises avoid. [Severe] Theoretical
Ramipril → see ACE inhibitors
Ramucirumab → see monoclonal antibodies

Quetiapine – Ramucirumab 943
Ranibizumab

- Ranibizumab is predicted to increase the risk of bleeding events when given with argatroban. [Severe] Theoretical
- Ranibizumab is predicted to increase the risk of bleeding events when given with bivalirudin. [Moderate] Theoretical
- Ranibizumab increases the risk of bleeding events when given with coumarins. [Severe] Theoretical
- Ranibizumab is predicted to increase the risk of bleeding events when given with danaparoid. [Severe] Theoretical
- Ranibizumab increases the risk of bleeding events when given with heparin (unfractionated). [Severe] Theoretical
- Ranibizumab increases the risk of bleeding events when given with low molecular-weight heparins. [Severe] Theoretical
- Ranibizumab is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
- Ranitidine is predicted to increase the exposure to vitamin K antagonists. Separate administration by 12 hours. [Moderate] Study
- Ranolazine is predicted to increase the exposure to afatinib. Separate administration by 12 hours. [Moderate] Study
- Ranolazine is predicted to increase the exposure to alliskiren. [Moderate] Theoretical
- Antiarrhythmics (dronedarone) are predicted to increase the exposure to ranolazine. [Severe] Study Also see TABLE 9 p. 820
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ranolazine. Avoid. [Severe] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ranolazine. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ranolazine. Avoid. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ranolazine. Avoid. [Severe] Study
- Ciclosporin is predicted to increase the concentration of ciclosporin and ranolazine is predicted to increase the concentration of ciclosporin. [Moderate] Theoretical
- Cobimetinib is predicted to increase the exposure to ranolazine. Avoid. [Severe] Study
- Ranolazine is predicted to increase the exposure to colchicine. Avoid or adjust colchicine dose. [Severe] Theoretical
- Crizotinib is predicted to increase the exposure to ranolazine. [Severe] Study Also see TABLE 9 p. 820
- Ranolazine is predicted to increase the exposure to dabigatran. [Severe] Theoretical
- Ranolazine increases the concentration of digoxin. [Moderate] Study
- Ranolazine is predicted to slightly increase the exposure to edoxaban. [Severe] Theoretical
- Enzalutamide is predicted to slightly decrease the exposure to ranolazine. Avoid. [Severe] Study
- Ranolazine is predicted to increase the exposure to erlotinib. [Moderate] Theoretical
- Ranolazine is predicted to increase the exposure to fیدaxomycin. Avoid. [Moderate] Study
- Grapefruit juice is predicted to increase the concentration of ranolazine. Avoid. [Severe] Theoretical
- HIV- protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to ranolazine. Avoid. [Severe] Study Also see TABLE 9 p. 820
- HIV- protease inhibitors (indinavir) are predicted to increase the exposure to ranolazine. [Severe] Study
- Idelalisib is predicted to increase the exposure to ranolazine. Avoid. [Severe] Study
- Imitinib is predicted to increase the exposure to ranolazine. [Severe] Study
- Ranolazine is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical
- Macrolides (clarithromycin) are predicted to increase the exposure to ranolazine. Avoid. [Severe] Study Also see TABLE 9 p. 820
- Macrolides (erythromycin) are predicted to increase the exposure to ranolazine. [Severe] Study
- Netupitant is predicted to increase the exposure to ranolazine. [Severe] Study
- Nilotinib is predicted to increase the exposure to ranolazine. [Severe] Study Also see TABLE 9 p. 820
- Ranolazine is predicted to increase the exposure to nintedanib. [Moderate] Study
- Rifampicin is predicted to decrease the exposure to ranolazine. Avoid. [Severe] Study
- St John’s Wort is predicted to increase the exposure to ranolazine. Avoid. [Severe] Study
- Ranolazine is predicted to increase the exposure to statins (atorvastatin). [Moderate] Theoretical
- Ranolazine is predicted to increase the exposure to statins (simvastatin). Adjust simvastatin dose, p. 130. [Moderate] Study
- Ranolazine increases the concentration of tacrolimus. Adjust dose. [Severe] Aneanotal
- Ranolazine is predicted to increase the risk of bleeding events when given with ticagrelor. Use with caution or avoid. [Severe] Study
- Ranolazine is predicted to increase the exposure to toptecan. [Severe] Study
- Ranolazine is predicted to increase the concentration of trametinib. [Moderate] Theoretical
- Ranolazine is predicted to increase the exposure to venetoclax. Avoid or monitor for toxicity. [Severe] Theoretical
- Rasagiline is predicted to increase the exposure to monoamine-oxidase B inhibitors
- Reboxetine
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to reboxetine. [Moderate] Aneanotol
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to reboxetine. Avoid. [Moderate] Study
- Anti- monoamine-oxidase A and B inhibitors, moclobemide
- HIV- protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to reboxetine. Avoid. [Moderate] Study
- Reboxetine is predicted to increase the risk of hypokalaemia when given with loop diuretics. [Moderate] Theoretical
- Macrolides (clarithromycin) are predicted to increase the exposure to reboxetine. Avoid. [Moderate] Study
- Reboxetine is predicted to increase the risk of a hypertensive crisis when given with linezolid. Avoid. [Severe] Theoretical
- Reboxetine is predicted to increase the risk of hypokalaemia when given with loop diuretics. [Moderate] Theoretical
- Regorafenib is predicted to increase the risk of a hypertensive crisis when given with moclubemide. Avoid. [Severe] Theoretical
- Reboxetine is predicted to increase the risk of a hypertensive crisis when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid. [Severe] Theoretical
- Reboxetine is predicted to increase the risk of a hypertensive crisis when given with monoamine-oxidase B inhibitors (rasagiline, selegiline). Avoid. [Severe] Theoretical
- Rifampicin is predicted to decrease the exposure to reboxetine. [Moderate] Aneanotol
- Reboxetine is predicted to increase the risk of hypokalaemia when given with thiazide diuretics. [Moderate] Aneanotol
- Reboxetine is predicted to increase the risk of hypokalaemia when given with thiazide diuretics. [Moderate] Aneanotol
- Regorafenib is predicted to increase the risk of a hypertensive crisis when given with moclubemide. Avoid. [Severe] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to regorafenib. Avoid. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to regorafenib. Avoid. [Moderate] Study
Cobicistat is predicted to increase the exposure to regorafenib. Avoid. [Moderate] Study

Regorafenib is predicted to increase the risk of bleeding events when given with coumarins. [Severe] Study

Enzalutamide is predicted to decrease the exposure to regorafenib. Avoid. [Moderate] Study

Grapefruit juice is predicted to increase the exposure to regorafenib. Avoid. [Moderate] Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to regorafenib. Avoid. [Moderate] Study

Idelalisib is predicted to increase the exposure to regorafenib. Avoid. [Moderate] Study

Macrolides (clarithromycin) are predicted to increase the exposure to methotrexate. [Severe] Theoretical → Also see TABLE 15 p. 821

Regorafenib is predicted to increase the exposure to tetracyclines. ([mefenamic acid]). Avoid. [Moderate] Theoretical → Also see TABLE 4 p. 818

Regorafenib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical

Rifampicin is predicted to decrease the exposure to regorafenib. Avoid. [Moderate] Study

Regorafenib is predicted to increase the exposure to statins (atorvastatin, fluvastatin, rosuvastatin). [Severe] Theoretical

Remifentanil → see opioids

Repaglinide → see TABLE 14 p. 821 (antidiabetic drugs)

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to repaglinide. Monitor blood glucose and adjust dose. [Moderate] Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to repaglinide. [Moderate] Study

Ciclosporin moderately increases the exposure to repaglinide. [Moderate] Study

Clopidogrel increases the exposure to repaglinide. [Severe] Study

Cobicistat is predicted to increase the exposure to repaglinide. [Moderate] Study

Enzalutamide is predicted to decrease the exposure to repaglinide. Monitor blood glucose and adjust dose. [Moderate] Study

Fibrates (gemfibrozil) markedly increase the exposure to repaglinide. Avoid. [Severe] Study

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to repaglinide. [Moderate] Study

Idelalisib is predicted to increase the exposure to repaglinide. [Moderate] Study

Iron chelators (deferasirox) moderately increase the exposure to repaglinide. Avoid. [Moderate] Study

Lumacaftor is predicted to decrease the exposure to repaglinide. Adjust dose. [Moderate] Theoretical

Macrolides (clarithromycin) are predicted to increase the exposure to repaglinide. [Moderate] Study

Pitolisant is predicted to decrease the exposure to repaglinide. [Unknown] Theoretical

Rifampicin is predicted to decrease the exposure to repaglinide. [Unknown] Theoretical

Teriflunomide is predicted to decrease the exposure to repaglinide. [Moderate] Study

Trimethoprim slightly increases the exposure to repaglinide. Avoid or monitor blood glucose. [Moderate] Study

Resilizumab → see monoclonal antibodies

Retetase → see TABLE 3 p. 818 (anticoagulant effects)

Retigabine → see antiepileptics

Retinoids → see TABLE 5 p. 818 (thromboembolism)

Acitretin, adapalene, altretinoin, bexarotene, isotretinoin, tazarotene, tretinoin

Consumption of alcohol might increase the serum concentration of etretinate in patients taking acitretin.

Avoid concomitant use of keratolytics in patients taking acitretin and isotretinoin.

Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

Antiarhythmic (amiodarone) are predicted to increase the exposure to altretinoin. Adjust altretinoin dose. [Moderate] Theoretical

Antifungals, azoles (fluconazole, itraconazole, ketoconazole, miconazole, voriconazole) are predicted to increase the exposure to altretinoin. Adjust altretinoin dose. [Moderate] Theoretical

Antifungals, azoles (fluconazole, ketoconazole, voriconazole) are predicted to increase the risk of tretinoin toxicity when given with tretinoin. [Moderate] Study

Cobicistat is predicted to increase the exposure to altretinoin. Adjust altretinoin dose. [Moderate] Theoretical

Fibrates (gemfibrozil) are predicted to increase the exposure to altretinoin. Adjust altretinoin dose. [Moderate] Theoretical

Fibrates (gemfibrozil) increase the concentration of bexarotene. Avoid. [Severe] Study

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to altretinoin. Adjust altretinoin dose. [Moderate] Theoretical

Rifampicin increases the risk of toxicity when given with vitamin A. Adjust dose. [Moderate] Theoretical

Retinoids (acitretin, altretinoin, isotretinoin, tretinoin) increase the risk of benign intracranial hypertension when given with tetracyclines. Avoid. [Severe] Anecdotal

Bexarotene is predicted to increase the risk of toxicity when given with vitamin A. Adjust dose. [Moderate] Theoretical

Retinoids (acitretin, altretinoin, isotretinoin) are predicted to increase the risk of vitamin A toxicity when given with vitamin A. Avoid. [Severe] Theoretical

Tretinoin is predicted to increase the risk of vitamin A toxicity when given with vitamin A. Avoid. [Severe] Study

Ribavirin

Ribavirin is predicted to increase the exposure to didanosine. Avoid. [Severe] Study

Ribavirin increases the risk of toxicity when given with stavudine. Avoid. [Severe] Study

Ribavirin increases the risk of anaemia and/or leucopenia when given with zidovudine. Avoid. [Severe] Study

Rifabutin

GENERAL INFORMATION Although some manufacturers class rifabutin as a potent inducer of CYP3A4, clinical data suggests it is potentially a weak inducer, and therefore the BNF does not extrapolate the interactions of potent CYP3A4 inducers to rifabutin. For those who wish to err on the side of caution, see the interactions of rifampicin but bear in mind other mechanisms might be involved.

Antifungals, azoles (fluconazole) increase the risk of uveitis when given with rifabutin. Adjust dose. [Severe] Study

Antifungals, azoles (itraconazole, posaconazole) increase the concentration of rifabutin and rifabutin decreases the concentration of antifungals, azoles (itraconazole, posaconazole). Avoid. [Severe] Study

Antifungals, azoles (ketoconazole) are predicted to increase the concentration of rifabutin and rifabutin is predicted to decrease the concentration of antifungals, azoles (ketoconazole). Avoid. [Severe] Theoretical

Antifungals, azoles (miconazole) are predicted to increase the concentration of rifabutin. Use with caution and adjust dose. [Moderate] Theoretical

Rifabutin is predicted to decrease the exposure to antifungals, azoles (isavuconazole). Avoid. [Severe] Theoretical
Rifabutin (continued)

- Rifabutin decreases the concentration of antifungals, azoles (voriconazole) and antifungals, azoles (voriconazole) increase the concentration of rifabutin. Avoid or adjust voriconazole dose. p. 361, (Severe) Study

- Rifabutin slightly decreases the exposure to antimalarials (atovaquone). Avoid. (Moderate) Study

- Rifabutin decreases the concentration of cobicistat and cobicistat increases the exposure to rifabutin. Avoid or adjust dose. (Severe) Study

- Rifabutin is predicted to decrease the efficacy of combined hormonal contraceptives. For FSHR guidance, see Contraceptives, interactions p. 474. (Severe) Study

- Rifabutin increases the clearance of dapson. (Moderate) Study

- Rifabutin is predicted to decrease the efficacy of desogestrel. For FSHR guidance, see Contraceptives, interactions p. 474. (Severe) Study

- Efavirenz slightly decreases the exposure to rifabutin. Adjust dose. (Severe) Study

- Rifabutin is predicted to decrease the efficacy of etonogestrel. For FSHR guidance, see Contraceptives, interactions p. 474. (Severe) Study

- Rifabutin decreases the exposure to etravirine. (Moderate) Study

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, saquinavir, tipranavir) increase the exposure to rifabutin. Monitor and adjust dose. (Severe) Study

- HIV-protease inhibitors (indinavir) increase the exposure to rifabutin and rifabutin decreases the exposure to HIV-protease inhibitors (indinavir). Avoid. (Severe) Study

- HIV-protease inhibitors (ritonavir) markedly increase the exposure to rifabutin. Avoid or adjust dose. (Severe) Study

- Rifabutin is predicted to decrease the effects of Hormone replacement therapy. (Moderate) Anecdotal

- Rifabutin is predicted to decrease the efficacy of levonorgestrel. For FSHR guidance, see Contraceptives, interactions p. 474. (Severe) Study

- Lumacaftor is predicted to decrease the exposure to rifabutin. Adjust dose. (Moderate) Theoretical

- Macrolides (azithromycin) increase the risk of neutropenia when given with rifabutin. (Severe) Study

- Macrolides (clarithromycin) increase the risk of uveitis when given with rifabutin. Adjust dose. (Severe) Study

- Rifabutin is predicted to decrease the efficacy of norethisterone. For FSHR guidance, see Contraceptives, interactions p. 474. (Severe) Study

- Rifabutin slightly decreases the exposure to ripivirine. Adjust dose. (Severe) Study

- Rifabutin is predicted to decrease the exposure to simprevir. Avoid. (Moderate) Theoretical

- Rifabutin decreases the efficacy of ulipristal. For FSHR guidance, see Contraceptives, interactions p. 474. (Severe) Study

Rifampicin

- Rifampicin is predicted to decrease the exposure to abacavir. (Moderate) Theoretical

- Rifampicin is predicted to decrease the exposure to abiraterone. Avoid. (Severe) Study

- Rifampicin is predicted to decrease the exposure to afatinib. (Moderate) Study

- Rifampicin is predicted to decrease the exposure to agomelatine. (Moderate) Theoretical

- Rifampicin is predicted to decrease the exposure to aldosterone antagonists (spironolactone). Avoid. (Moderate) Theoretical

- Rifampicin decreases the exposure to aliskiren. (Moderate) Study

- Rifampicin is predicted to decrease the exposure to alprazolam. Adjust alprazolam dose. (Moderate) Theoretical

- Rifampicin transiently increases the exposure to ambrisantan. (Moderate) Study

- Rifampicin decreases the exposure to aminophylline. Adjust dose. (Moderate) Study

- Antacids decrease the absorption of rifampicin. Rifampicin should be taken 1 hour before antacids. (Moderate) Study

- Rifampicin is predicted to decrease the exposure to antiarhythmics (disopyramide, droneradone). Avoid. (Severe) Study

- Rifampicin is predicted to decrease the efficacy of antiarhythmics (propafenone). (Moderate) Study

- Rifampicin is predicted to decrease the exposure to anticholinesterases, centrally acting (donepezil). (Moderate) Study

- Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to antiepileptics (phenobarbital, primidone). Use with caution and adjust dose. (Moderate) Study

- Rifampicin slightly decreases the exposure to antiepileptics (brivaracetam). Adjust dose. (Moderate) Study

- Rifampicin decreases the concentration of antiepileptics (fosphenytoin, phenytoin). Use with caution and adjust dose. (Moderate) Study

- Rifampicin markedly increases the clearance of antiepileptics (lamotrigine). Adjust lamotrigine dose, p. 194, (Moderate) Study

- Rifampicin is predicted to decrease the exposure to antiepileptics (perampanel). Monitor and adjust dose. (Moderate) Study

- Rifampicin slightly decreases the exposure to antifungals, azoles (fluconazole). Adjust dose. (Moderate) Study

- Rifampicin is predicted to decrease the exposure to antifungals, azoles (itraconazole). Avoid. (Severe) Study

- Rifampicin markedly decreases the exposure to antifungals, azoles (itraconazole). Avoid rifampicin for 14 days before and during treatment with itraconazole. (Moderate) Study

- Rifampicin markedly decreases the exposure to antifungals, azoles (ketoconazole) and antifungals, azoles (ketoconazole) potentially decrease the exposure to rifampicin. Avoid. (Moderate) Study

- Rifampicin is predicted to decrease the exposure to antimalarials (artemether) with lumefantrine. Avoid. (Severe) Study

- Rifampicin moderately decreases the exposure to antimalarials (atovaquone) and antimalarials (atovaquone) slightly increase the exposure to rifampicin. Avoid. (Moderate) Study

- Rifampicin moderately decreases the exposure to antimalarials (mefloquine). (Severe) Study

- Rifampicin is predicted to decrease the concentration of antimalarials (piperazine). Avoid. (Moderate) Theoretical

- Rifampicin decreases the exposure to antimalarials (quinine). (Severe) Study

- Rifampicin is predicted to moderately decrease the exposure to apixaban. Use with caution or avoid. (Severe) Study

- Rifampicin moderately decreases the exposure to apreplin. Avoid. (Severe) Study

- Rifampicin is predicted to markedly decrease the exposure to aprepitant. Avoid. (Moderate) Study

- Rifampicin is predicted to moderately decrease the exposure to aripiprazole. Adjust aripiprazole dose, p. 240. (Moderate) Study

- Rifampicin decreases the exposure to ataluren. (Moderate) Study

- Rifampicin is predicted to decrease the exposure to axtinin. Avoid or adjust dose. (Moderate) Study

- Rifampicin is predicted to decrease the exposure to bazedoxifene. (Moderate) Theoretical

- Rifampicin decreases the exposure to bedaquiline. Avoid. (Severe) Study

- Rifampicin moderately decreases the exposure to beta blockers, non-selective (carvedilol). (Moderate) Study

- Rifampicin decreases the exposure to beta blockers, non-selective (propranolol). Monitor and adjust propranolol dose. (Moderate) Study

- Rifampicin slightly decreases the exposure to beta blockers, selective (bisoprolol, metoprolol). Avoid. (Moderate) Study

- Rifampicin moderately decreases the exposure to beta blockers, selective (ciloperol). Avoid. (Moderate) Study

- Rifampicin slightly decreases the exposure to bortezomib. Avoid. (Severe) Study
- Rifampicin affects the exposure to bosentan. Avoid. [Severe Study]
- Rifampicin is predicted to very markedly decrease the exposure to bosutinib. Avoid. [Severe Study]
- Rifampicin is predicted to markedly decrease the exposure to buPROPion. [Severe Study]
- Rifampicin is predicted to decrease the exposure to buspirone. Use with caution and adjust dose. [Severe Study]
- Rifampicin moderately decreases the exposure to cabozantinib. Avoid. [Moderate Study]
- Rifampicin is predicted to moderately increase the clearance of caffeine citrate. Monitor and adjust dose. [Moderate Study]
- Rifampicin is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nimodipine). Monitor and adjust dose. [Moderate Study]
- Rifampicin decreases the exposure to calcium channel blockers (diltiazem). [Severe Study]
- Rifampicin decreases the exposure to calcium channel blockers (isradipine). Avoid. [Moderate Study]
- Rifampicin moderately decreases the exposure to calcium channel blockers (nifedipine). Avoid. [Severe Study]
- Rifampicin is predicted to decrease the exposure to calcium channel blockers (verapamil). [Severe Study]
- Rifampicin moderately decreases the exposure to canagliflozin. Adjust canagliflozin dose. [Moderate Study]
- Rifampicin is predicted to decrease the exposure to cannabis extract. Avoid. [Severe] Theoretical
- Rifampicin decreases the concentration of caspofungin. Adjust caspofungin dose, p. 356. [Moderate Study]
- Rifampicin is predicted to decrease the exposure to certitinib. Avoid. [Severe Study]
- Rifampicin decreases the concentration of chloramphenicol. [Moderate Study]
- Rifampicin is predicted to decrease the exposure to chloridiazepoxide. [Moderate] Theoretical
- Rifampicin decreases the concentration of ciclosporin. [Severe Study]
- Rifampicin is predicted to alter the effects of cilostazol. [Moderate] Theoretical
- Rifampicin decreases the exposure to clomethiazole. Monitor and adjust dose. [Moderate] Study
- Rifampicin decreases the exposure to clozapine. [Severe] Anecdotal
- Rifampicin is predicted to decrease the exposure to cobicistat. Avoid. [Severe] Theoretical
- Rifampicin is predicted to decrease the exposure to cobimetinib. Avoid. [Severe] Theoretical
- Rifampicin is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Study
- Rifampicin is predicted to decrease the exposure to corticosteroids (budesonide, dexamethasone, methylprednisolone, prednisolone). Monitor and adjust dose. [Moderate] Study
- Rifampicin is predicted to decrease the exposure to corticosteroids (fluticasone). [Unknown] Theoretical
- Rifampicin is predicted to decrease the exposure to corticosteroids (prednisone). [Mild] Study
- Rifampicin decreases the anticoagulant effect of coumarins. [Severe Study]
- Rifampicin is predicted to markedly decrease the exposure to crizotinib. Avoid. [Severe Study]
- Rifampicin is predicted to decrease the exposure to dabigatran. Avoid. [Severe Study]
- Rifampicin is predicted to decrease the exposure to dabrafenib. Avoid. [Moderate] Theoretical
- Rifampicin is predicted to moderately decrease the exposure to daclatasvir. Avoid. [Severe Study]
- Rifampicin moderately decreases the exposure to dapsone. [Moderate Study]
- Rifampicin is predicted to decrease the exposure to darifenacin. [Moderate] Theoretical
- Rifampicin is predicted to decrease the exposure to dasabuvir. Avoid. [Severe] Theoretical
- Rifampicin is predicted to markedly decrease the exposure to dasatinib. Avoid. [Severe] Study
- Rifampicin is predicted to slightly decrease the exposure to delamanid. Avoid. [Moderate] Study
- Rifampicin is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical
- Rifampicin moderately decreases the exposure to diazepam. Avoid. [Moderate] Study
- Rifampicin decreases the concentration of digoxin. [Moderate] Study
- Rifampicin decreases the exposure to dolutegravir. Adjust dose. [Severe] Study
- Rifampicin is predicted to decrease the exposure to edoxaban. [Moderate] Study
- Rifampicin slightly decreases the exposure to efavirenz. Adjust dose. [Severe] Study
- Rifampicin is predicted to decrease the exposure to elbasvir. Avoid. [Severe Study]
- Rifampicin is predicted to decrease the concentration of elvitegravir. Avoid. [Severe] Theoretical
- Rifampicin is predicted to decrease the effects of ergotamine. [Moderate] Theoretical
- Rifampicin is predicted to decrease the exposure to erlotinib. Avoid or adjust erlotinib dose. [Severe] Study
- Rifampicin is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical
- Rifampicin is predicted to decrease the exposure to etravirine. Avoid. [Severe] Theoretical
- Rifampicin is predicted to decrease the concentration of everolimus. Avoid or adjust dose. [Severe] Study
- Rifampicin moderately decreases the exposure to exemestane. [Moderate] Study
- Rifampicin is predicted to decrease the exposure to fesoterodine. Avoid. [Moderate] Study
- Rifampicin is predicted to decrease the exposure to fingolimod. [Moderate] Study
- Rifampicin is predicted to decrease the exposure to fosaprepitant. Avoid. [Moderate] Theoretical
- Rifampicin is predicted to decrease the exposure to grazoprevir. Avoid. [Severe Study]
- Rifampicin is predicted to decrease the concentration of guanfacine. Adjust guanfacine dose, p. 222. [Moderate] Study
- Rifampicin decreases the concentration of haloperidol. Adjust dose. [Moderate] Study
- Rifampicin is predicted to moderately to markedly decrease the exposure to HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, indinavir, lopinavir, saquinavir, tipranavir). Avoid. [Severe] Study
- Rifampicin slightly decreases the exposure to HIV-protease inhibitors (ritonavir). [Severe] Study
- Rifampicin is predicted to decrease the effects of Hormone replacement therapy. [Moderate] Anecdotal
- Rifampicin is predicted to decrease the exposure to ibritinib. Avoid. [Severe] Study
- Rifampicin is predicted to decrease the exposure to idelalisib. Avoid. [Severe] Study
- Rifampicin is predicted to decrease the exposure to imatinib. Avoid. [Moderate] Study
- Rifampicin is predicted to decrease the exposure to irinotecan. Avoid. [Severe Study]
- Rifampicin is predicted to decrease the exposure to iron chelators (deferasirox). Monitor serum ferritin and adjust dose. [Moderate] Study
- Rifampicin is predicted to decrease the exposure to ivabradine. Adjust dose. [Moderate] Theoretical
- Rifampicin markedly decreases the exposure to ivacaftor. Avoid. [Severe] Study
- Rifampicin is predicted to decrease the exposure to ixazomib. Avoid. [Severe Study]
- Rifampicin is predicted to decrease the exposure to lapatinib. Avoid. [Severe] Study
Rifampicin (continued)

- **Rifampicin** is predicted to decrease the exposure to **ledipasvir**. Avoid. [Severe] Theoretical
- **Rifampicin** is predicted to decrease the efficacy of **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Theoretical
- **Rifampicin** is predicted to decrease the exposure to **linagliptin**. [Moderate] Study
- **Rifampicin** slightly decreases the exposure to **linezolid**. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to **lomitapide**. Monitor and adjust dose. [Moderate] Theoretical
- **Rifampicin** increases the clearance of **lorazepam**. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to **lusidone**. Avoid. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to **macitentan**. Avoid. [Severe] Study
- **Rifampicin** decreases the concentration of **macrolides** (clarithromycin). [Severe] Study
- **Rifampicin** is predicted to decrease the exposure to **maraviroc**. Adjust dose. [Severe] Study
- **Rifampicin** is predicted to decrease the exposure to **midazolam**. Monitor and adjust dose. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to **mirtazapine**. Adjust dose. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to **modafinil**. [Moderate] Theoretical
- **Rifampicin** decreases the effects of **monoclonal antibodies** (brentuximab vedotin). [Severe] Study
- **Rifampicin** is predicted to decrease the exposure to monoclonal antibodies (trastuzumab emtansine). [Severe] Theoretical
- **Rifampicin** is predicted to decrease the exposure to **montelukast**. [Moderate] Study
- **Rifampicin** decreases the concentration of **mycophenolate**. Monitor and adjust dose. [Severe] Study
- **Rifampicin** is predicted to markedly decrease the exposure to **naloxegol**. Avoid. [Moderate] Study
- **Rifampicin** is predicted to slightly decrease the exposure to **nateglinide**. [Mild] Study
- **Rifampicin** is predicted to decrease the exposure to **netupitant**. Avoid. [Moderate] Study
- **Rifampicin** decreases the concentration of **nevirapine**. Avoid. [Severe] Study
- **Rifampicin** is predicted to moderately decrease the exposure to **nilotinib**. Avoid. [Severe] Study
- **Rifampicin** is predicted to decrease the exposure to **nintedanib**. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to **nitisinone**. Adjust nitisinone dose. [Moderate] Theoretical
- **Rifampicin** increases the clearance of **nitrazepam**. [Moderate] Study
- **Rifampicin** is predicted to decrease the efficacy of **noretisterone**. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Anecdotal
- **Rifampicin** moderately decreases the exposure to **NSAIDs** (celecoxib, diclofenac, etoricoxib). [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to **olaparib**. Avoid. [Moderate] Theoretical
- **Rifampicin** is predicted to decrease the exposure to **ombitasvir**. Avoid. [Severe] Theoretical
- **Rifampicin** is predicted to decrease the exposure to **ondansetron**. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to opioids (alfentanil, fentanyl). [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to opioids (buprenorphine). Monitor and adjust dose. [Moderate] Theoretical
- **Rifampicin** decreases the exposure to opioids (codeine, morphine). [Moderate] Study
- **Rifampicin** decreases the exposure to opioids (methadone). Monitor and adjust dose. [Severe] Study
- **Rifampicin** is predicted to decrease the exposure to opioids (oxycodeone). Monitor and adjust dose. [Moderate] Study
- **Rifampicin** is predicted to moderately decrease the exposure to **osimertinib**. Avoid. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to **palbociclib**. Avoid. [Severe] Study
- **Rifampicin** is predicted to decrease the exposure to **paliperidone**. Monitor and adjust paliperidone dose. [Moderate] Theoretical
- **Rifampicin** is predicted to decrease the exposure to **panobinostat**. Avoid. [Moderate] Theoretical
- **Rifampicin** is predicted to decrease the exposure to **paracetamol**. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to **paripaprevir** (with ritonavir and ombitasvir). Avoid. [Severe] Study
- **Rifampicin** is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (avanafil, tadalaflil). Avoid. [Severe] Study
- **Rifampicin** is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (sildenafil, vardenafil). [Moderate] Theoretical
- **Rifampicin** moderately decreases the exposure to **pioglitazone**. Avoid. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to proton pump inhibitors (omeprazole). [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to **quetiapine**. [Moderate] Study
- **Rifampicin** slightly decreases the exposure to **raltegravir**. Avoid or adjust dose. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to **ranolazine**. Avoid. [Severe] Study
- **Rifampicin** is predicted to decrease the exposure to **reboxetine**. Avoid. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to **repaglinide**. Monitor blood glucose and adjust dose. [Moderate] Study
- **Rifampicin** markedly decreases the exposure to **rilpivirine**. Avoid. [Severe] Study
- **Rifampicin** is predicted to decrease the exposure to **risperidone**. Adjust risperidone dose. [Moderate] Study
- **Rifampicin** is predicted to moderately decrease the exposure to **ristocetin**. Avoid. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to **sacubitril**. [Moderate] Theoretical
- **Rifampicin** is predicted to moderately decrease the exposure to **salomecin**. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to **seleupag**. [Unknown] Theoretical
- **Rifampicin** is predicted to decrease the exposure to **simprevir**. Avoid. [Severe] Study
- **Rifampicin** is predicted to decrease the concentration of **sirolimus**. Avoid. [Severe] Study
- **Rifampicin** is predicted to decrease the exposure to **sofosbuvir**. Avoid. [Severe] Study
- **Rifampicin** is predicted to decrease the exposure to **solifenacin**. [Moderate] Theoretical
- **Rifampicin** is predicted to decrease the exposure to **sorafenib**. [Moderate] Theoretical
- **Rifampicin** markedly decreases the exposure to **statins** (atorvastatin). **Atorvastatin** should be taken at the same time as rifampicin. [Moderate] Study
Rifampicin moderately decreases the exposure to statins (fluvastatin). Monitor and adjust dose. [Moderate] Study

Rifampicin very markedly decreases the exposure to statins (simvastatin). [Moderate] Study

Rifampicin is predicted to decrease the exposure to sulfonylureas. [Moderate] Study

Rifampicin is predicted to decrease the exposure to sunstitinib. Avoid or adjust sunstitinib dose. [Moderate] Study

Rifampicin decreases the concentration of tacrolimus. Monitor and adjust dose. [Severe] Study

Rifampicin markedly decreases the exposure to tamoxifen. [Unknown] Study

Rifampicin is predicted to decrease the exposure to taxanes (cabazitaxel, paclitaxel). Avoid. [Severe] Study

Rifampicin is predicted to decrease the exposure to taxanes (docetaxel). [Severe] Study

Rifampicin is predicted to decrease the concentration of temsirolimus. Avoid. [Severe] Study

Rifampicin decreases the exposure to terbinafine. Adjust dose. [Moderate] Study

Rifampicin decreases the exposure to tetracyclines (doxycycline). Monitor and adjust dose. [Moderate] Study

Rifampicin is predicted to decrease the exposure to theophylline. Adjust dose. [Moderate] Study

Rifampicin is predicted to markedly decrease the exposure to ticagrelor. Avoid. [Severe] Study

Rifampicin moderately decreases the exposure to tizanidine. [Mild] Study

Rifampicin is predicted to decrease the exposure to tolvaptan. Avoid. [Severe] Study

Rifampicin is predicted to decrease the exposure to toremifene. Adjust dose. [Moderate] Study

Rifampicin is predicted to decrease the exposure to trabectedin. Avoid. [Severe] Study

Rifampicin decreases the exposure to trimethoprim. [Moderate] Study

Rifampicin decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Anecdotal

Rifampicin is predicted to decrease the exposure to vandetanib. Avoid. [Moderate] Study

Rifampicin is predicted to moderately decrease the exposure to vemurafenib. Avoid. [Severe] Theoretical

Rifampicin is predicted to decrease the exposure to venetoclax. Avoid. [Severe] Study

Rifampicin is predicted to decrease the exposure to vinca alkaloids (vinblastine, vincristine, vindesine). [Severe] Theoretical

Rifampicin is predicted to decrease the exposure to vinca alkaloids (vinflunine). Avoid. [Severe] Theoretical

Rifampicin is predicted to decrease the exposure to vinca alkaloids (vinorelbine). Use with caution or avoid. [Severe] Theoretical

Rifampicin is predicted to decrease the exposure to vismodegib. Avoid. [Moderate] Theoretical

Rifampicin is predicted to decrease the exposure to vortioxetine. Monitor and adjust dose. [Moderate] Study

Rifampicin markedly decreases the exposure to zaleplon. [Moderate] Study

Rifampicin moderately decreases the exposure to zolpidem. [Moderate] Study

Rifampicin is predicted to decrease the exposure to zopiclone. Adjust dose. [Moderate] Study

Rifaximin

Ciclosporin very markedly increases the exposure to rifaximin. [Severe] Study

Rilpivirine

Antacids are predicted to decrease the exposure to rilpivirine. Antacids should be taken 2 hours before or 4 hours after rilpivirine. [Severe] Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) markedly decrease the exposure to rilpivirine. Avoid. [Severe] Study

Antiepileptics (oxcarbazepine) are predicted to decrease the concentration of rilpivirine. Avoid. [Severe] Theoretical

Bozentan is predicted to decrease the exposure to rilpivirine. Avoid. [Severe] Theoretical

Calcium salts (calcium carbonate) are predicted to slightly decrease the exposure to rilpivirine. Calcium carbonate should be taken 2 hours before or 4 hours after rilpivirine. [Severe] Theoretical

Efavirenz is predicted to decrease the exposure to rilpivirine. Avoid. [Severe] Theoretical

Enzalutamide markedly decreases the exposure to rilpivirine. Avoid. [Severe] Theoretical

Etravirine is predicted to decrease the exposure to rilpivirine. Avoid. [Severe] Theoretical

H2 receptor antagonists are predicted to decrease the exposure to rilpivirine. H2 receptor antagonists should be taken 12 hours before or 4 hours after rilpivirine. [Severe] Study

Nevirapine is predicted to decrease the exposure to rilpivirine. Avoid. [Severe] Theoretical

Proton pump inhibitors are predicted to decrease the exposure to rilpivirine. Avoid. [Severe] Study

Rifabutin slightly decreases the exposure to rilpivirine. Adjust dose. [Severe] Study

Rifampicin markedly decreases the exposure to rilpivirine. Avoid. [Severe] Study

St John’s Wort is predicted to decrease the exposure to rilpivirine. Avoid. [Severe] Theoretical

Riluzole

Food and lifestyle

Charcoal-grilled foods are predicted to decrease the exposure to riluzole.

SSRIs (fluvoxamine) are predicted to increase the exposure to riluzole. [Moderate] Theoretical

Riociguat → see TABLE 8 p. 819 (hypotension)

Antacids slightly decrease the exposure to riociguat. Antacids should be taken 2 hours before or 1 hour after riociguat. [Mild] Study

Antifungals, azoles (itraconazole) are predicted to increase the exposure to riociguat. Avoid. [Moderate] Study

Antifungals, azoles (ketonazole) moderately increase the exposure to riociguat. Avoid. [Moderate] Study

Ciclosporin is predicted to increase the exposure to riociguat. [Moderate] Theoretical

Ciclosporin is predicted to increase the exposure to riociguat. [Moderate] Theoretical

HIV-protease inhibitors (ritonavir) are predicted to increase the exposure to riociguat. Avoid. [Moderate] Theoretical

Riociguat is predicted to increase the risk of hypotension when given with phosphodiesterase type-5 inhibitors. Avoid. [Severe] Theoretical → Also see TABLE 8 p. 819

Risedronate → see bisphosphonates

Risperidone → see TABLE 8 p. 819 (hypotension), TABLE 9 p. 820 (QT-interval prolongation), TABLE 11 p. 820 (CNS depressant effects)

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to risperidone. Adjust risperidone dose. [Moderate] Study → Also see TABLE 11 p. 820

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study → Also see TABLE 9 p. 820

Bupropion is predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study

Ciclosporin is predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study

Cobicistat is predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study

Risperidone is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Severe] Theoretical → Also see TABLE 8 p. 819 → Also see TABLE 9 p. 820

Enzalutamide is predicted to decrease the exposure to risperidone. Adjust risperidone dose. [Moderate] Study

Risperidone is predicted to decrease the effects of histamine. Avoid. [Severe] Theoretical → Also see TABLE 8 p. 819

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study → Also see TABLE 9 p. 820
**Risperidone (continued)**

- **Idelalisib** is predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study
- **Risperidone** is predicted to decrease the effects of levodopa. Avoid or adjust dose. [Severe] Anecdotal → Also see TABLE 8 p. 819
- **Risperidone** potentially increases the risk of neurotoxicity when given with lithium. [Severe] Anecdotal → Also see TABLE 9 p. 820
- **Macrolides (clarithromycin)** are predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study → Also see TABLE 9 p. 820
- **Rifaximin** is predicted to decrease the exposure to risperidone. Adjust dose. [Moderate] Study
- **SSRI** (fluoxetine, paroxetine) are predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study
- **Terbinafine** is predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study
- **Ritonavir** → see HIV-protease inhibitors
- **Rivaroxaban** → see monoclonal antibodies

**Rivaroxaban** → see TABLE 3 p. 818 (anticoagulant effects)

- **Antiarhythmics (dronedarone)** are predicted to increase the exposure to rivaroxaban. Avoid. [Moderate] Theoretical
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to moderately decrease the exposure to rivaroxaban. Avoid unless patient can be monitored for signs of thrombosis. [Severe] Study
- **Antifungals, azoles (itraconazole, ketoconazole)** are predicted to increase the exposure to rivaroxaban. Avoid. [Severe] Study
- **Enzalutamide** is predicted to moderately decrease the exposure to rivaroxaban. Avoid unless patient can be monitored for signs of thrombosis. [Severe] Study
- **Rifampicin** moderately increase the exposure to rivaroxaban. Avoid. [Severe] Study
- **Beta blockers, non-selective (propranolol)** slightly to moderately increase the exposure to rivaroxaban. Adjust dose and separate administration by at least 2 hours. [Moderate] Study
- **Rifampicin** is predicted to moderately decrease the exposure to rivaroxaban. Avoid unless patient can be monitored for signs of thrombosis. [Severe] Study
- **Moxonidine** is predicted to increase the exposure to rivaroxaban. Adjust dose. [Moderate] Study → Also see TABLE 13 p. 821
- **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the exposure to rivaroxaban. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 13 p. 821
- **Rocuronium** → see neuromuscular blocking drugs, non-depolarising

**Rotafanime** is predicted to slightly increase the exposure to roflumilast. Avoid. [Moderate] Theoretical

- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to roflumilast. Avoid. [Moderate] Study
- **Combined hormonal contraceptives** are predicted to increase the exposure to roflumilast. [Moderate] Theoretical
- **Enzalutamide** is predicted to decrease the exposure to roflumilast. Avoid. [Moderate] Study
- **H₂ receptor antagonists (cimetidine)** slightly increase the exposure to roflumilast. [Moderate] Study
- **Ciprofloxacin** are predicted to increase the exposure to roflumilast. [Moderate] Study
- **Rifaximin** is predicted to decrease the exposure to roflumilast. [Moderate] Study
- **SSRI** (fluvoxamine) are predicted to increase the exposure to roflumilast. [Moderate] Study
- **Theophylline** is predicted to slightly increase the exposure to roflumilast. Avoid. [Moderate] Theoretical
- **Ropinirole** → see dopamine receptor agonists
- **Ropivacaine** → see anaesthetics, local
- **Rosuvastatin** → see statins

**Rotavirus vaccine** → see live vaccines

**Rotigotine** → see dopamine receptor agonists

**Rufinamide** → see antiepileptics

**Ruxolitinib** → see TABLE 15 p. 821 (myelosuppression)

- **Antiarhythmics (dronedarone)** are predicted to increase the exposure to ruxolitinib. [Moderate] Theoretical
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to ruxolitinib. Monitor and adjust dose. [Moderate] Study
- **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to ruxolitinib. [Moderate] Theoretical
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to ruxolitinib. Adjust dose and monitor side effects. [Moderate] Study
- **Aprepitant** is predicted to increase the exposure to ruxolitinib. [Moderate] Theoretical
- **Bosentan** is predicted to decrease the exposure to ruxolitinib. Monitor and adjust dose. [Moderate] Theoretical
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to ruxolitinib. [Moderate] Theoretical
- **Cobicistat** is predicted to increase the exposure to ruxolitinib. Adjust dose and monitor side effects. [Moderate] Study
- **Ruxolitinib** is predicted to increase the risk of bleeding events when given with coumarins. [Severe] Theoretical
- **Crizotinib** is predicted to increase the exposure to ruxolitinib. [Moderate] Theoretical
- **Grapefruit juice** is predicted to increase the exposure to ruxolitinib. [Severe] Theoretical
- **HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to increase the exposure to ruxolitinib. Adjust dose and monitor side effects. [Moderate] Study
- **HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to ruxolitinib. [Moderate] Theoretical
- **Idelalisib** is predicted to increase the exposure to ruxolitinib. Adjust dose and monitor side effects. [Moderate] Study
- **Idelalisib** predicted to increase the exposure to ruxolitinib. [Moderate] Theoretical
- **Macrolides (clarithromycin)** are predicted to increase the exposure to ruxolitinib. Adjust dose and monitor side effects. [Moderate] Study
- **Macrolides (erythromycin)** are predicted to increase the exposure to ruxolitinib. [Moderate] Theoretical
- **Netupitant** is predicted to increase the exposure to ruxolitinib. [Moderate] Theoretical
- **Nevirapine** is predicted to decrease the exposure to ruxolitinib. Monitor and adjust dose. [Moderate] Theoretical
- **Nilotinib** is predicted to increase the exposure to ruxolitinib. [Moderate] Theoretical → Also see TABLE 15 p. 821
- **Ruxolitinib** is predicted to increase the exposure to ruxolitinib. [Moderate] Theoretical
- **Rifampicin** is predicted to decrease the exposure to ruxolitinib. [Moderate] Study
- **Ruxolitinib** is predicted to increase the exposure to ruxolitinib. Monitor and adjust dose. [Moderate] Study
- **St John’s Wort** is predicted to decrease the exposure to ruxolitinib. [Moderate] Theoretical
- **Sacubitril** → see TABLE 8 p. 819 (hypotension)
- **Ciclosporin** is predicted to increase the exposure to sacubitril. [Moderate] Theoretical
- **Rifampicin** is predicted to increase the exposure to sacubitril. [Moderate] Theoretical
- **Sacubitril** is predicted to increase the exposure to statins. [Severe] Study
- **Tenofovir** is predicted to increase the exposure to sacubitril. [Moderate] Theoretical
- **Safinamide** → see monoamine-oxidase B inhibitors
- **Salbutamol** → see beta agonists
- **Salmeterol** → see beta, agonists
- **Sapropterin** → see TABLE 8 p. 819 (hypotension)
Methotrexate is predicted to decrease the efficacy of saxagliptin. [Moderate] Theoretical

Phosphodiesterase type-5 inhibitors are predicted to increase the risk of hypotension when given with saxagliptin. [Moderate] Theoretical → Also see TABLE 8 p. 819

Trimethoprim is predicted to decrease the efficacy of saxagliptin. [Moderate] Theoretical

Saquinavir → see HIV-protease inhibitors

Saxagliptin → see TABLE 14 p. 821 (antidiabetic drugs)

Antiarhythmic (dronedarone) are predicted to increase the exposure to saxagliptin. [Mild] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to saxagliptin. [Moderate] Study

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to saxagliptin. [Mild] Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to saxagliptin. [Moderate] Study

Aprepitant is predicted to increase the exposure to saxagliptin. [Moderate] Study

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to saxagliptin. [Mild] Study

Cobicistat is predicted to increase the exposure to saxagliptin. [Moderate] Study

Crizotinib is predicted to increase the exposure to saxagliptin. [Mild] Study

Enzalutamide is predicted to moderately decrease the exposure to saxagliptin. [Moderate] Study

Grapefruit juice is predicted to increase the exposure to saxagliptin. [Mild] Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to saxagliptin. [Moderate] Study

HIV-protease inhibitors (indinavir) are predicted to increase the exposure to saxagliptin. [Mild] Study

Idelalisib is predicted to increase the exposure to saxagliptin. [Moderate] Study

Imatinib is predicted to increase the exposure to saxagliptin. [Mild] Study

Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to saxagliptin. [Moderate] Study

Macrolides (erythromycin) are predicted to increase the exposure to saxagliptin. [Moderate] Study

Netupitant is predicted to increase the exposure to saxagliptin. [Mild] Study

Nilotinib is predicted to increase the exposure to saxagliptin. [Mild] Study

Rifampicin is predicted to moderately decrease the exposure to saxagliptin. [Moderate] Study

Secukinumab → see monoclonal antibodies

Selegiline → see monoamine-oxidase B inhibitors

Selenium is predicted to decrease the absorption of eltrombopag. Eltrombopag should be taken 2 hours before or 4 hours after selenium. [Severe] Theoretical

Selexipag

Antiepileptics (valproate) are predicted to increase the exposure to selexipag. [Unknown] Theoretical

Antifungals, azoles (fluconazole) are predicted increase the exposure to selexipag. [Unknown] Theoretical

Fibrates (gemfibrozil) are predicted to increase the exposure to selexipag. Avoid. [Severe] Theoretical

Rifaximin is predicted to decrease the exposure to selexipag. [Unknown] Theoretical

Senna → see TABLE 17 p. 822 (reduced serum potassium)

Sertraline → see SSRIs

Severofurane → see volatile halogenated anaesthetics

Sildenafil → see phosphodiesterase type-5 inhibitors

Siltuximab → see monoclonal antibodies

Silver sulfadiazine

Silver might inactivate enzymatic debriding agents—concurrent use might not be appropriate.

Simprevir

Antiarhythmic (dronedarone) are predicted to increase the exposure to simprevir. Avoid. [Severe] Study

Simprevir is predicted to increase the concentration of antiarrhythmics (amiodarone). Refer to specialist literature. [Severe] Anecdotal

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study

Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to decrease the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to simprevir. Avoid. [Severe] Study

Bosentan is predicted to decrease the exposure to simprevir. Avoid. [Severe] Study

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to simprevir. Avoid. [Severe] Study

Cobicistat is predicted to increase the exposure to simprevir. Avoid. [Severe] Study

Efavirenz is predicted to decrease the exposure to simprevir. Avoid. [Severe] Study

Enzalutamide is predicted to decrease the exposure to simprevir. Avoid. [Severe] Study

Etravirine is predicted to decrease the exposure to simprevir. Avoid. [Moderate] Study

HIV-protease inhibitors are predicted to increase the exposure to simprevir. Avoid. [Severe] Study

Idelalisib is predicted to increase the exposure to simprevir. Avoid. [Severe] Study

Imatinib is predicted to increase the exposure to simprevir. Avoid. [Severe] Study

Ledipasvir moderately increases the exposure to simprevir and simprevir slightly increases the exposure to ledipasvir. Avoid. [Severe] Study

Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to simprevir. Avoid. [Severe] Study

Netupitant is predicted to increase the exposure to simprevir. Avoid. [Severe] Study

Nevirapine is predicted to decrease the exposure to simprevir. Avoid. [Severe] Study

Nilotinib is predicted to increase the exposure to simprevir. Avoid. [Severe] Study

Rifabutin is predicted to decrease the exposure to simprevir. Avoid. [Moderate] Theoretical

Rifaximin is predicted to decrease the exposure to simprevir. Avoid. [Severe] Study

St John’s Wort is predicted to decrease the exposure to simprevir. Avoid. [Severe] Study

Simprevir moderately increases the exposure to statins (atorvastatin). Monitor and adjust dose. [Moderate] Study

Simprevir is predicted to increase the exposure to statins (pravastatin). Monitor and adjust dose. [Severe] Theoretical

Simprevir moderately increases the exposure to statins (rosuvastatin). Adjust rosuvastatin dose, p. 130. [Moderate] Study

Simprevir slightly increases the exposure to statins (simvastatin). Monitor and adjust dose. [Moderate] Study

Simvastatin → see statins

Sirolimus

Antiarhythmic (amiodarone) are predicted to increase the concentration of sirolimus. [Severe] Anecdotal

Antiarhythmic (dronedarone) increase the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of sirolimus. Avoid. [Severe] Study

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) increase the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study

Selenium

Selenium is predicted to decrease the absorption of eltrombopag. Eltrombopag should be taken 2 hours before or 4 hours after selenium. [Severe] Theoretical

Selexipag

Antiepileptics (valproate) are predicted to increase the exposure to selexipag. [Unknown] Theoretical

Antifungals, azoles (fluconazole) are predicted increase the exposure to selexipag. [Unknown] Theoretical

Fibrates (gemfibrozil) are predicted to increase the exposure to selexipag. Avoid. [Severe] Theoretical

Rifaximin is predicted to decrease the exposure to selexipag. [Unknown] Theoretical

Senna → see TABLE 17 p. 822 (reduced serum potassium)

Sertraline → see SSRIs

Severofurane → see volatile halogenated anaesthetics

Sildenafil → see phosphodiesterase type-5 inhibitors

Siltuximab → see monoclonal antibodies

Silver sulfadiazine

Silver might inactivate enzymatic debriding agents—concurrent use might not be appropriate.
Sirolimus (continued)
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of sirolimus. Avoid. [Severe] Study
- Antifungals, azoles (miconazole) are predicted to increase the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study
- Aprepitant increases the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study
- Bosentan is predicted to decrease the concentration of sirolimus and sirolimus potentially increases the concentration of bosentan. Avoid. [Severe] Theoretical
- Calcium channel blockers (diltiazem, verapamil) increase the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study
- Ceritinib is predicted to increase the exposure to sirolimus. Avoid. [Severe] Theoretical
- Ciclosporin moderately increases the exposure to sirolimus. Separate administration by 4 hours. [Severe] Study
- Cobicistat is predicted to increase the concentration of sirolimus. Avoid. [Severe] Study
- Crizotinib increases the concentration of sirolimus. Monitor and adjust dose. [Moderate] Theoretical
- Enalapril is predicted to decrease the concentration of sirolimus. Avoid. [Severe] Study
- Grapefruit juice increases the concentration of sirolimus. Avoid. [Moderate] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the concentration of sirolimus. Avoid. [Severe] Study
- Idelalisib is predicted to increase the concentration of sirolimus. Avoid. [Severe] Study
- Imatinib increases the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study
- Lapatinib is predicted to increase the exposure to sirolimus. [Moderate] Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with sirolimus. Public Health England advises avoid. [Severe] Theoretical
- Lumacaftor is predicted to decrease the exposure to sirolimus. Avoid. [Severe] Theoretical
- Macrolides (clarithromycin) are predicted to increase the concentration of sirolimus. Avoid. [Severe] Study
- Macrolides (erythromycin) increase the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study
- Sirolimus is predicted to decrease the efficacy of mifamurtide. Avoid. [Severe] Theoretical
- Mirabegron is predicted to increase the exposure to sirolimus. [Mild] Theoretical
- Netupitant increases the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study
- Nevirapine is predicted to decrease the concentration of sirolimus. Monitor and adjust dose. [Moderate] Theoretical
- Nilotinib increases the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study
- Sirolimus is predicted to decrease the concentration of tacrolimus and tacrolimus increases the exposure to sirolimus. [Severe] Study
- Velpatasvir is predicted to increase the exposure to sirolimus. [Severe] Theoretical

Sodium aurothiomalate
- ACE inhibitors are predicted to increase the risk of hypersensitivity when given with sodium aurothiomalate. [Severe] Anecdotal
- Sodium aurothiomalate potentially increases the risk of side-effects when given with penicillamine (in those who have had previous adverse reactions to gold). Avoid. [Severe] Study

Sodium bicarbonate
- Sodium bicarbonate decreases the concentration of lithium. [Severe] Anecdotal
- Sodium bicarbonate is predicted to decrease the efficacy of methenamine. Avoid. [Moderate] Theoretical

Sodium citrate
- Sodium citrate is predicted to decrease the efficacy of methenamine. Avoid. [Moderate] Theoretical
- Sodium citrate is predicted to increase the risk of side-effects when given with sucrafate. Avoid. [Moderate] Theoretical

Sodium clodronate
- see bisphosphonates

Sodium feredetate
- see iron (oral)

Sodium nitroprusside
- see TABLE 8 p. 819 (hypotension)
- Sodium nitroprusside is predicted to increase the risk of methaemoglobinemia when given with topical anaesthetics, local (prilocaine). Use with caution or avoid. [Severe] Theoretical
- Sodium nitroprusside is predicted to increase the risk of methaemoglobinemia when given with dapson. [Severe] Theoretical

Sodium oxybate
- see TABLE 8 p. 819 (hypotension), TABLE 11 p. 820 (CNS depressant effects)
- Antiemetics (valproate) increase the exposure to sodium oxybate. Adjust sodium oxybate dose. [Moderate] Study

Sodium phenylbutyrate
- Antiemetics (valproate) potentially decrease the effects of sodium phenylbutyrate. [Moderate] Anecdotal
- Corticosteroids potentially decrease the effects of sodium phenylbutyrate. [Moderate] Anecdotal
- Haloperidol potentially decreases the effects of sodium phenylbutyrate. [Moderate] Anecdotal

Sodium picosulfate
- see TABLE 18 p. 822 (hyponatraemia), TABLE 17 p. 822 (reduced serum potassium)

Sodium stibogluconate
- Sodium stibogluconate increases the risk of cardiovascular side-effects when given with amphotericin. Separate administration by 14 days. [Severe] Study

Sofosbuvir
- Sofosbuvir is predicted to increase the risk of severe bradycardia or heart block when given with antirhythmics (amiodarone). Refer to specialist literature. [Severe] Anecdotal
- Antiepileptics (carbamazepine, fosphenytoin, oxcarbazepine, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to sofosbuvir. Avoid. [Severe] Study
- H₂ receptor antagonists potentially decrease the exposure to sofosbuvir. Adjust dose, see sofosbuvir with lędzisn and sofosbuvir with velpatasvir. [Moderate] Study
- HIV-protease inhibitors (tipranavir) are predicted to decrease the exposure to sofosbuvir. Avoid. [Severe] Theoretical
- Proton pump inhibitors potentially decrease the exposure to sofosbuvir. Adjust dose, see sofosbuvir with lędzisn and sofosbuvir with velpatasvir. [Moderate] Study
- Rifampicin is predicted to decrease the exposure to sofosbuvir. Avoid. [Severe] Study
- Rifampicin is predicted to decrease the exposure to sofosbuvir. Avoid. [Severe] Study
- Rifampicin is predicted to decrease the exposure to sofosbuvir. Avoid. [Severe] Study
- St John’s Wort is predicted to decrease the exposure to sofosbuvir. Avoid. [Severe] Study

Solifenacin
- See TABLE 10 p. 820 (antimuscarinics)
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to solifenacin. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to solifenacin. [Moderate] Theoretical
- Sofosbuvir is predicted to increase the risk of severe bradycardia or heart block when given with antirhythmics (amiodarone). Refer to specialist literature. [Severe] Anecdotal
- Antiepileptics (carbamazepine, fosphenytoin, oxcarbazepine, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to sofosbuvir. Adjust dose, see sofosbuvir with lędzisn and sofosbuvir with velpatasvir. [Moderate] Study
- Proton pump inhibitors potentially decrease the exposure to sofosbuvir. Adjust dose, see sofosbuvir with lędzisn and sofosbuvir with velpatasvir. [Moderate] Study
- Rifampicin is predicted to decrease the exposure to sofosbuvir. Avoid. [Severe] Study
- Rifampicin is predicted to decrease the exposure to sofosbuvir. Avoid. [Severe] Study
- St John’s Wort is predicted to decrease the exposure to sofosbuvir. Avoid. [Severe] Study
- Antihistamines potentially decrease the risk of hypersensitivity when given with solifenacin. Adjust solifenacin or tamsulosin with solifenacin dose; avoid in hepatic and renal impairment. [Severe] Study
- Cobicistat is predicted to increase the exposure to solifenacin. Adjust solifenacin or tamsulosin with solifenacin dose; avoid in hepatic and renal impairment. [Severe] Study
- Enalapril is predicted to decrease the exposure to solifenacin. [Moderate] Theoretical
- Solifenacin is predicted to decrease the exposure to solifenacin. [Moderate] Theoretical

Sitagliptin
- see TABLE 14 p. 821 (antidiabetic drugs)
HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to solifenacin. Adjust solifenacin or tamsulosin with solifenacin dose; avoid in hepatic and renal impairment. [Severe] Study

Idealalisib is predicted to increase the exposure to solifenacin. Adjust solifenacin or tamsulosin with solifenacin dose; avoid in hepatic and renal impairment. [Severe] Study

Macrolides (clarithromycin) are predicted to increase the exposure to solifenacin. Adjust solifenacin or tamsulosin with solifenacin dose; avoid in hepatic and renal impairment. [Severe] Study

rifampicin is predicted to decrease the exposure to solifenacin. [Moderate] Theoretical

Somatropin

Corticosteroids are predicted to decrease the effects of somatropin. [Moderate] Theoretical

Sorafenib → see Table 15 p. 821 (myelosuppression), Table 9 p. 820 (QT-interval prolongation)

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to sorafenib. [Moderate] Theoretical

sorafenib increases the anticoagulant effect of coumarins. [Severe] Anecdotal

Enzalutamide is predicted to decrease the exposure to sorafenib. [Moderate] Theoretical

Neomycin moderately decreases the exposure to sorafenib. [Moderate] Study

Sorafenib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical

rifampicin is predicted to decrease the exposure to sorafenib. [Moderate] Theoretical

Sotalol → see beta blockers, non-selective

Spironolactone → see aldosterone antagonists

SSRIs → see Table 18 p. 822 (hyponatraemia), Table 13 p. 821 (serotonin syndrome), Table 9 p. 820 (QT-interval prolongation), Table 4 p. 818 (antipla teletack effects

citalopram → dapoxetine, escitalopram → fluoxetine → fluvoxamine → paroxetine → sertraline

Fluvoxamine markedly increases the exposure to agomelatine. Avoid. [Severe] Study

fluvoxamine moderately increases the exposure to alprazolam. Adjust dose. [Moderate] Study

SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to amfetamines. [Severe] Theoretical → Also see Table 13 p. 821

Fluvoxamine moderately increases the exposure to aminophylline. Avoid. [Severe] Study

Fluvoxamine decreases the clearance of anaesthetics, local (ropivacaine). Avoid prolonged use. [Moderate] Study

Fluvoxamine is predicted to increase the exposure to anagrelide. [Moderate] Theoretical → Also see Table 4 p. 818

Antiarhythmics (dronedarone) are predicted to increase the exposure to dapoxetine. Adjust dapoxetine dose. [Moderate] Theoretical

Antiarhythmics (dronedarone) are predicted to increase the exposure to SSRIs (citalopram, escitalopram, fluoxetine, fluvoxamine, paroxetine, sertraline). [Severe] Theoretical → Also see Table 9 p. 820

SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to antiarhythmics (flecainide). [Severe] Theoretical

SSRIs (fluoxetine, fluvoxamine, paroxetine) are predicted to increase the exposure to antiarhythmics (propafenone). Monitor and adjust dose. [Moderate] Study

SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to anticholinesterases, centrally acting (donepezil). [Moderate] Theoretical

SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to anticholinesterases, centrally acting (galantamine). Monitor and adjust dose. [Moderate] Study

Antiepileptics (fosphenytoin, phenytoin) decrease the concentration of paroxetine. [Moderate] Study

Sertraline potentially increases the risk of toxicity when given with antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Severe] Anecdotal

SSRIs (fluoxetine, fluvoxamine) are predicted to increase the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor and adjust dose. [Severe] Anecdotal

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to dapoxetine. Adjust dapoxetine dose. [Moderate] Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to dapoxetine. Avoid or adjust dapoxetine dose. [Severe] Study

Antifungals, azoles (voriconazole) are predicted to increase the exposure to citalopram. [Severe] Theoretical → Also see Table 9 p. 820

Antihistamines, sedating (cyprihoheptadine) potentially decrease the effects of SSRIs. [Moderate] Anecdotal

Aprepitant is predicted to increase the exposure to dapoxetine. Adjust dapoxetine dose. [Moderate] Theoretical

SSRIs (fluoxetine, paroxetine) are predicted to moderately increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 240. [Moderate] Study

Fluvoxamine increases the exposure to asenapine. [Moderate] Study

Paroxetine moderately increases the exposure to asenapine. [Moderate] Study

SSRIs (fluoxetine, paroxetine) are predicted to markedly increase the exposure to atomoxetine. Adjust dose. [Severe] Study

SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to beta blockers, non-selective (carvedilol, timolol). [Moderate] Study

Fluvoxamine moderately increases the concentration of beta blockers, non-selective (propranolol). [Moderate] Study

SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). [Moderate] Study

Bupropion is predicted to increase the exposure to dapoxetine. [Moderate] Theoretical → Also see Table 13 p. 821

Fluvoxamine markedly decreases the clearance of caffeine citrate. Monitor and adjust dose. [Severe] Study

Fluvoxamine is predicted to increase the exposure to cilostazol. Adjust cilostazol dose. [Moderate] Theoretical → Also see Table 4 p. 818

Cinacalcet is predicted to increase the exposure to dapoxetine. [Moderate] Theoretical

Fluvoxamine is predicted to increase the exposure to cinacalcet. Adjust dose. [Moderate] Theoretical

Fluvoxamine is predicted to decrease the efficacy of clopidogrel. Avoid. [Severe] Theoretical → Also see Table 4 p. 818

Fluvoxamine increases the concentration of clozapine. Monitor side effects and adjust dose. [Severe] Study

Cobicistat is predicted to moderately increase the exposure to dapoxetine. Avoid or adjust dapoxetine dose. [Severe] Study

Crizotinib is predicted to increase the exposure to dapoxetine. Adjust dapoxetine dose. [Moderate] Theoretical

SSRIs (fluoxetine, paroxetine) are predicted to slightly increase the exposure to darifenacin. [Mild] Study

Fluvoxamine moderately increases the exposure to diazepam. [Moderate] Study

Fluvoxamine is predicted to increase the exposure to dopamine receptor agonists (ropinirole). Adjust dose. [Moderate] Study

Fluvoxamine markedly increases the exposure to duloxetine. Avoid. [Severe] Study → Also see Table 18 p. 822 → Also see Table 13 p. 821 → Also see Table 4 p. 818

Fluvoxamine is predicted to increase the exposure to erlotinib. Monitor side effects and adjust dose. [Moderate] Theoretical

Fluvoxamine increases the concentration of furoxatrapitan. [Severe] Study → Also see Table 13 p. 821

Grapefruit juice moderately increases the exposure to sertraline. Avoid. [Moderate] Study

H₂-receptor antagonists (cimetidine) slightly increase the exposure to SSRIs (citalopram, escitalopram). Adjust dose. [Moderate] Study
SSRIs (continued)
- H₂ receptor antagonists (cimetidine) slightly increase the exposure to SSRIs (paroxetine, sertraline). [Moderate] Study
- Fluoxetine increases the concentration of haloperidol. Adjust dose. [Moderate] Anecdotal
- Fluvoxamine increases the concentration of haloperidol. Adjust dose. [Moderate] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to moderately increase the exposure to dapoxetine. Avoid or adjust dapoxetine dose. [Severe] Study
- HIV-protease inhibitors (indinavir) are predicted to increase the exposure to dapoxetine. Adjust daboxetine dose. [Moderate] Theoretical
- Idealalis is predicted to moderately increase the exposure to dapoxetine. Avoid or adjust dapoxetine dose. [Severe] Study
- Imatinib is predicted to increase the exposure to dapoxetine. Adjust dapoxetine dose. [Moderate] Theoretical
- Fluoxetine is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Unknown] Theoretical
- Fluvoxamine is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical
- Fluvoxamine is predicted to increase the exposure to loxapine. Avoid. [Unknown] Theoretical
- Lumacaftor is predicted to decrease the exposure to SSRIs (citalopram, escitalopram, sertraline). Adjust dose. [Moderate] Theoretical
- Macrolides (clarithromycin) are predicted to moderately increase the exposure to dapoxetine. Avoid or adjust dapoxetine dose. [Severe] Study
- Macrolides (erythromycin) are predicted to increase the exposure to dapoxetine. Adjust daboxetine dose. [Moderate] Theoretical
- Fluvoxamine very markedly increases the exposure to melatonin. Avoid. [Severe] Study
- Netupitant is predicted to increase the exposure to dapoxetine. Adjust daboxetine dose. [Moderate] Theoretical
- SSRIs potentially increase the risk of prolonged neuromuscular blockade when given with neuromuscular blocking drugs, non-depolarising (mivacurium). [Unknown] Theoretical
- Nilotinib is predicted to increase the exposure to dapoxetine. Adjust daboxetine dose. [Moderate] Theoretical
- Fluvoxamine moderately increases the exposure to olanzapine. Adjust dose. [Severe] Anecdotal
- SSRIs (fluoxetine, paroxetine) are predicted to decrease the efficacy of opioids (codeine). [Moderate] Theoretical
- SSRIs (fluoxetine, paroxetine) are predicted to decrease the efficacy of opioids (tramadol). [Severe] Study → Also see TABLE 13 p. 821
- Fluvoxamine is predicted to increase the exposure to pentoxifylline. [Moderate] Theoretical
- Paroxetine markedly increases the exposure to phenothiazines (perphenazine). [Severe] Study
- Fluvoxamine is predicted to moderately increase the exposure to pirenperone. Avoid. [Moderate] Study
- SSRIs (fluoxetine, paroxetine) are predicted to moderately increase the exposure to pitolastin. Use with caution and adjust dose. [Moderate] Study
- Fluvoxamine moderately increases the exposure to pemolamidomide. Adjust pemolamidomide dose. [Moderate] Study
- Paroxetine slightly increases the exposure to procyclidine. Monitor and adjust procyclidine dose. [Moderate] Study
- Proton pump inhibitors (esomeprazole) are predicted to slightly to moderately increase the exposure to citalopram. Monitor and adjust dose. [Severe] Theoretical
- Proton pump inhibitors (esomeprazole) are predicted to increase the exposure to escitalopram. Monitor and adjust dose. [Severe] Theoretical
- Fluvoxamine is predicted to increase the exposure to proton pump inhibitors. [Mild] Study
- Proton pump inhibitors (omeprazole) slightly to moderately increase the exposure to SSRIs (citalopram, escitalopram). Monitor and adjust dose. [Severe] Study
- Fluvoxamine is predicted to increase the exposure to riluzole. [Moderate] Theoretical
- SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to risperdone. Adjust dose. [Moderate] Study
- Fluvoxamine is predicted to increase the exposure to rufinamide. [Moderate] Study
- SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to SSRIs (dapoxetine). [Moderate] Theoretical → Also see TABLE 18 p. 822 → Also see TABLE 13 p. 821 → Also see TABLE 4 p. 818
- SSRIs potentially increase the risk of prolonged neuromuscular blockade when given with suxamethonium. [Unknown] Theoretical
- SSRIs (fluoxetine, paroxetine) are predicted to decrease the efficacy of tamoxifen. Avoid. [Severe] Study
- Terbinafine is predicted to increase the exposure to fluoxetine. Adjust dose. [Moderate] Theoretical
- Terbinafine moderately increases the exposure to paroxetine. [Moderate] Study
- Terbinafine is predicted to increase the exposure to 5SSRIs (citalopram, dapoxetine, escitalopram, fluvoxamine, sertraline). [Moderate] Theoretical
- Fluvoxamine moderately to markedly increases the exposure to theophylline. Avoid. [Severe] Study
- Fluvoxamine very markedly increases the exposure to tizanidine. Avoid. [Severe] Study
- SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to tricyclic antidepressants. Monitor for toxicity and adjust dose. [Severe] Study → Also see TABLE 13 p. 821 → Also see TABLE 18 p. 822
- Fluvoxamine increases the exposure to tricyclic antidepressants (amitriptyline, imipramine). Adjust dose. [Severe] Study → Also see TABLE 18 p. 822 → Also see TABLE 13 p. 821
- Fluvoxamine markedly increases the exposure to tricyclic antidepressants (clomipramine). Adjust dose. [Severe] Study → Also see TABLE 18 p. 822 → Also see TABLE 13 p. 821
- SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to vortioxetine. Monitor and adjust dose. [Moderate] Study → Also see TABLE 13 p. 821 → Also see TABLE 4 p. 818
- Fluvoxamine is predicted to increase the exposure to zoledriniptan. Adjust zoledriniptan dose, p. 280. [Severe] Theoretical → Also see TABLE 13 p. 821

St John’s Wort → See TABLE 13 p. 821 (serotonin syndrome)
- St John’s Wort is predicted to decrease the exposure to afatinib. [Moderate] Study
- St John’s Wort is predicted to slightly decrease the exposure to aldosterone antagonists (eplerenone). Avoid. [Moderate] Study
- St John’s Wort decreases the exposure to aliskiren. [Moderate] Study
- St John’s Wort moderately decreases the exposure to alprazolam. [Moderate] Study
- St John’s Wort is predicted to decrease the concentration of aminophylline. [Severe] Theoretical
- St John’s Wort is predicted to decrease the exposure to antihypertensives (prazosine). Avoid. [Severe] Theoretical
- St John’s Wort is predicted to decrease the concentration of antiepileptics (briviactam). [Moderate] Theoretical
- St John’s Wort is predicted to decrease the concentration of antiepileptics (carbamazepine). Monitor and adjust dose. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the concentration of antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone). Avoid. [Severe] Theoretical
- St John’s Wort is predicted to decrease the exposure to antiepileptics (perampanel). Monitor and adjust dose. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the exposure to antifungals, azoles (isavuconazole). Avoid. [Severe] Theoretical
- St John’s Wort moderately decreases the exposure to antifungals, azoles (voriconazole). Avoid. [Moderate] Study
- St John’s Wort is predicted to decrease the concentration of antimarials (piperaquarine). Avoid. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the exposure to apixaban. Use with caution or avoid. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the exposure to aprinolast. Avoid. [Severe] Theoretical
- St John's Wort is predicted to decrease the exposure to aprepitant. Avoid. [Moderate] Theoretical
- St John's Wort is predicted to decrease the exposure to axitinib. [Moderate] Theoretical
- St John's Wort is predicted to decrease the exposure to bedaquiline. Avoid. [Severe] Study
- St John's Wort is predicted to decrease the exposure to bosentan. Avoid. [Moderate] Theoretical
- St John's Wort is predicted to decrease the exposure to cabozantinib. [Moderate] Theoretical
- St John's Wort is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Theoretical]
- St John's Wort is predicted to decrease the exposure to calcium channel blockers (diltiazem, verapamil). [Moderate] Theoretical
- St John's Wort is predicted to decrease the exposure to ceritinib. Avoid. [Severe] Theoretical
- St John's Wort decreases the concentration of ciclosporin. Avoid. [Moderate] Study
- St John's Wort is predicted to alter the effects of cilostazol. [Moderate] Theoretical
- St John's Wort is predicted to decrease the exposure to cisplatin. Avoid. [Severe] Theoretical
- St John's Wort is predicted to decrease the concentration of coumarins. Avoid. [Severe] Theoretical
- St John's Wort decreases the efficacy of combined hormonal contraceptives. MHRA advises avoid. For FSRH guidance, see Contraceptives, Interactions p. 474. [Anecdotal]
- St John's Wort decreases the anticoagulant effect of coumarins. Avoid. [Severe] Theoretical
- St John's Wort is predicted to decrease the exposure to dabigatran. Avoid. [Severe] Study
- St John's Wort is predicted to decrease the exposure to daclatasvir. Avoid. [Severe] Theoretical
- St John's Wort is predicted to decrease the exposure to darifenacin. [Moderate] Theoretical
- St John's Wort is predicted to decrease the exposure to dasatinib. [Severe] Study
- St John's Wort is predicted to decrease the efficacy of desogestrel. MHRA advises avoid. For FSRH guidance, see Contraceptives, Interactions p. 474. [Severe] Theoretical
- St John's Wort decreases the concentration of digoxin. Avoid. [Severe] Anecdotal
- St John's Wort decreases the exposure to dolutegravir. Adjust dose. [Severe] Study
- St John's Wort is predicted to decrease the exposure to edoxxan. [Moderate] Study
- St John's Wort is predicted to decrease the concentration of efavirenz. Avoid. [Severe] Theoretical
- St John's Wort is predicted to moderately decrease the exposure to elbasvir. Avoid. [Severe] Study
- St John's Wort is predicted to decrease the concentration of elvitegravir. Avoid. [Severe] Theoretical
- St John's Wort is predicted to decrease the effects of ergotamine. [Moderate] Theoretical
- St John's Wort is predicted to decrease the exposure to erlotinib. [Severe] Theoretical
- St John's Wort is predicted to decrease the efficacy of efavirenz. MHRA advises avoid. For FSRH guidance, see Contraceptives, Interactions p. 474. [Severe] Theoretical
- St John's Wort is predicted to decrease the exposure to etravirine. Avoid. [Severe] Study
- St John's Wort is predicted to decrease the exposure to everolimus. Avoid or adjust dose. [Severe] Study
- St John's Wort is predicted to decrease the exposure to exemestane. [Moderate] Theoretical
- St John's Wort is predicted to decrease the exposure to fesoterodine. Avoid. [Severe] Theoretical
- St John's Wort is predicted to decrease the exposure to fingolimod. Avoid. [Moderate] Theoretical
- St John's Wort is predicted to decrease the exposure to fosaprepitant. Avoid. [Moderate] Theoretical
- St John's Wort is predicted to decrease the exposure to gefitinib. Avoid. [Severe] Theoretical
- St John's Wort is predicted to markedly decrease the exposure to grazoprevir. Avoid. [Severe] Study
- St John's Wort is predicted to decrease the concentration of guanfacine. Adjust dose. [Moderate] Theoretical
- St John's Wort is predicted to decrease the exposure to HIV-protease inhibitors. Avoid. [Severe] Theoretical
- St John's Wort is predicted to decrease the efficacy of Hormone replacement therapy. [Moderate] Theoretical
- St John's Wort is predicted to decrease the exposure to imatinib. Avoid. [Severe] Theoretical
- St John's Wort is predicted to decrease the exposure to idelalisib. Avoid. [Severe] Theoretical
- St John's Wort is predicted to decrease the exposure to irinotecan. Avoid. [Severe] Study
- St John's Wort decreases the exposure to ivabradine. Avoid. [Moderate] Study
- St John's Wort is predicted to decrease the exposure to ivacaftor. Avoid. [Severe] Theoretical
- St John's Wort is predicted to decrease the exposure to ixazomib. Avoid. [Severe] Theoretical
- St John's Wort is predicted to decrease the exposure to lapatinib. Avoid. [Severe] Study
- St John's Wort is predicted to decrease the exposure to ledipasvir. Avoid. [Severe] Theoretical
- St John's Wort is predicted to decrease the efficacy of levonorgestrel. MHRA advises avoid. For FSRH guidance, see Contraceptives, Interactions p. 474. [Severe] Theoretical
- St John's Wort is predicted to decrease the exposure to lurisidine. Monitor and adjust dose. [Moderate] Theoretical
- St John's Wort is predicted to decrease the exposure to macitentan. Avoid. [Severe] Theoretical
- St John's Wort is predicted to decrease the exposure to maraviroc. Avoid. [Severe] Theoretical
- St John's Wort moderately decreases the exposure to midazolam. Monitor and adjust dose. [Moderate] Study
- St John's Wort is predicted to decrease the exposure to naloxegol. Avoid. [Moderate] Theoretical
- St John's Wort is predicted to decrease the concentration of nevirapine. Avoid. [Severe] Theoretical
- St John's Wort is predicted to decrease the exposure to nilotinib. Avoid. [Severe] Theoretical
- St John's Wort is predicted to decrease the exposure to nintedanib. [Moderate] Study
- St John's Wort is predicted to decrease the efficacy of norethisterone. MHRA advises avoid. For FSRH guidance, see Contraceptives, Interactions p. 474. [Severe] Anecdotal
- St John's Wort is predicted to decrease the exposure to olaparib. Avoid. [Moderate] Theoretical
- St John's Wort is predicted to decrease the concentration of olevancu. Avoid. [Severe] Theoretical
- St John's Wort is predicted to decrease the exposure to omibatavir. Avoid. [Severe] Theoretical
- St John's Wort decreases the exposure to opioids (methadone). Monitor and adjust dose. [Severe] Study + Also see TABLE 13 p. 821
- St John's Wort moderately decreases the exposure to opioids (oxycodone). Adjust dose. [Moderate] Study
- St John's Wort is predicted to decrease the exposure to ostrometer. Avoid. [Moderate] Theoretical
- St John's Wort is predicted to decrease the exposure to palbociclib. Avoid. [Severe] Theoretical
- St John's Wort is predicted to decrease the exposure to panobinostat. Avoid. [Moderate] Theoretical
- St John's Wort is predicted to decrease the exposure to panobinostat. Avoid. [Moderate] Theoretical
- St John's Wort is predicted to decrease the exposure to panobinostat. Avoid. [Moderate] Theoretical
- St John's Wort is predicted to decrease the exposure to panobinostat. Avoid. [Moderate] Theoretical
- St John's Wort is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors. [Moderate] Theoretical
- St John's Wort slightly decreases the exposure to pioglitazone. [Moderate] Study
St John’s Wort (continued)

- **St John’s Wort** is predicted to decrease the concentration of **tacrolimus**. Avoid. (Severe) Theoretical

- **St John’s Wort** is predicted to decrease the absorption of **dronedarone**. Avoid. (Severe) Theoretical

- **St John’s Wort** is predicted to decrease the exposure to **ritilivirine**. Avoid. (Severe) Theoretical

- **St John’s Wort** is predicted to decrease the exposure to **rapilavirine**. Avoid. (Severe) Theoretical

- **St John’s Wort** is predicted to decrease the exposure to **ruxolitinib**. Monitor and adjust dose. (Moderate) Theoretical

- **St John’s Wort** is predicted to decrease the exposure to **simeprevir**. Avoid. (Severe) Study

- **St John’s Wort** is predicted to decrease the concentration of **sirolimus**. Monitor and adjust dose. (Severe) Theoretical

- **St John’s Wort** is predicted to decrease the exposure to **sofosbuvir**. Avoid. (Severe) Study

- **St John’s Wort** slightly decreases the exposure to statins (atorvastatin). Mild Study

- **St John’s Wort** moderately decreases the exposure to statins (simvastatin). Moderate Study

- **St John’s Wort** decreases the concentration of **tacrolimus**. Avoid. (Severe) Study

- **St John’s Wort** is predicted to decrease the exposure to **taxanes (cabazitaxel)**. Avoid. (Severe) Study

- **St John’s Wort** is predicted to decrease the concentration of **temsirolimus**. Avoid. (Severe) Theoretical

- **St John’s Wort** potentially decreases the exposure to **theophylline**. Severe Anecdotal

- **St John’s Wort** is predicted to decrease the exposure to **ticagrelor**. Moderate Theoretical

- **St John’s Wort** is predicted to decrease the exposure to **tolvaptan**. (Moderate) Theoretical

- **St John’s Wort** is predicted to decrease the exposure to **topotecan**. Severe Theoretical

- **St John’s Wort** is predicted to decrease the exposure to **velpatasvir**. Avoid. (Moderate) Theoretical

- **St John’s Wort** is predicted to decrease the exposure to **vismodegib**. Avoid. (Moderate) Theoretical

**Statins** → see TABLE 1 p. 818 (hepatotoxicity)

**atorvastatin** + **fluavastatin** + **pravastatin** + **rosuvastatin** + **simvastatin**

**Atorvastatin** slightly to moderately increases the exposure to **alisiren**. Moderate Study

**Antacids** moderately decrease the absorption of **rosuvastatin**. Separate administration by 2 hours. (Moderate) Study

- **Antirhythmic (amiodarone)** are predicted to increase the risk of rhabdomyolysis when given with **atorvastatin**. Monitor and adjust dose. (Moderate) Theoretical

- **Antirhythmic (amiodarone)** are predicted to increase the exposure to **fluavastatin**. (Severe) Theoretical

- **Antirhythmic (amiodarone)** increase the risk of rhabdomyolysis when given with **simvastatin**. Adjust **simvastatin** dose, p. 130. Severe Study

- **Antirhythmic (dronedarone)** are predicted to increase the exposure to **atorvastatin**. Monitor and adjust dose. Severe Theoretical

- **Antirhythmic (dronedarone)** slightly increase the exposure to **rosuvastatin**. Adjust dose. Severe Study

- **Antirhythmic (dronedarone)** are predicted to increase the exposure to **simvastatin**. Use with caution and adjust **simvastatin** dose, p. 130. Severe Study

- **Antiepileptics (carbamazepine)** moderately decrease the exposure to **simvastatin**. Monitor and adjust dose. Severe Study → Also see TABLE 1 p. 818

- **Antiepileptics (carbamazepine, eslicarbazepine)** are predicted to decrease the exposure to **atorvastatin**. Monitor and adjust dose. Moderate Study

- **Antiepileptics (fosphenyoitin, phenytoin)** potentially decrease the exposure to statins (atorvastatin, simvastatin). Moderate Anecdotal

- **Antifungals, azoles (fluconazole, itasavonazole, posaconazole)** are predicted to increase the exposure to **atorvastatin**.

**Monitor and adjust dose. Severe** Theoretical → Also see TABLE 1 p. 818

- **Antifungals, azoles (fluconazole, miconazole)** are predicted to increase the exposure to **simvastatin**. Use with caution and adjust **simvastatin** dose, p. 130. Severe Study → Also see TABLE 1 p. 818

- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **atorvastatin**. Avoid or adjust dose and monitor rhabdomyolysis. Severe Study → Also see TABLE 1 p. 818

- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to **simvastatin**. Use with caution and adjust **simvastatin** dose, p. 130. Severe Study

- **Bosentan** slightly decreases the exposure to **atorvastatin**. Mild Study

- **Bosentan** moderately decreases the exposure to **simvastatin**. Moderate Study

- **Calcium channel blockers (amilodipine)** slightly increase the exposure to simvastatin. Adjust simvastatin dose, p. 130. Mild Study

- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **atorvastatin**. Monitor and adjust dose. Severe Theoretical

- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **simvastatin**. Use with caution and adjust **simvastatin** dose, p. 130. Severe Study

- **Cephalosporins (ceftobiprole)** are predicted to increase the concentration of statins. Moderate Theoretical

- **Ciclosporin** very markedly increases the exposure to **atorvastatin**. Avoid or adjust **atorvastatin** dose, p. 128. Severe Study

- **Ciclosporin** moderately increases the exposure to **fluavastatin**. Severe Study

- **Ciclosporin** markedly increases the exposure to **pravastatin**. Adjust pravastatin dose, p. 129. Severe Study

- **Ciclosporin** markedly increases the exposure to statins (rosuvastatin, simvastatin). Avoid. (Severe) Study

- **Clopidogrel** increases the exposure to **rosuvastatin**. Adjust **rosuvastatin** dose, p. 130. Moderate Study

- **Cobicistat** is predicted to increase the exposure to **atorvastatin**. Avoid or adjust dose and monitor rhabdomyolysis. Severe Study

- **Cobicistat** is predicted to increase the exposure to **simvastatin**. Avoid. Severe Study

- **Colchicine** increases the risk of rhabdomyolysis when given with statins. Severe Anecdotal

- **Statins (fluavastatin, rosuvastatin)** increase the anticoagulant effect of **coumarins**. Monitor INR and adjust dose. Severe Study

- **Crizotinib** is predicted to increase the exposure to **atorvastatin**. Monitor and adjust dose. Severe Theoretical

- **Crizotinib** is predicted to increase the exposure to **simvastatin**. Use with caution and adjust **simvastatin** dose, p. 130. Severe Study

- **Danazol** is predicted to increase the risk of rhabdomyolysis when given with **atorvastatin**. Severe Theoretical

- **Danazol** increases the risk of rhabdomyolysis when given with **simvastatin**. Avoid. (Severe) Anecdotal

- **Statins** are predicted to increase the risk of rhabdomyolysis when given with **daptomycin**. Severe Theoretical

- **Dasabuvir** increases the exposure to **rosuvastatin**. Adjust **rosuvastatin** dose, p. 130. Moderate Study

- **Dasatinib** is predicted to increase the exposure to **simvastatin**. Moderate Theoretical
Efavirenz slightly decreases the exposure to atorvastatin. [Mild] Study
Efavirenz moderately decreases the exposure to simvastatin. [Moderate] Study
Elbasvir potentially increases the exposure to atorvastatin. Adjust atorvastatin dose, p. 128. [Moderate] Study
Elbasvir is predicted to increase the exposure to fluvastatin. Adjust fluvastatin dose, p. 129. [Unknown] Theoretical
Elbasvir increases the exposure to rosuvastatin. Adjust rosuvastatin dose, p. 130. [Moderate] Study
Elbasvir is predicted to increase the exposure to simvastatin. Adjust simvastatin dose, p. 130. [Unknown] Theoretical
Eltrombopag is predicted to increase the exposure to statins. Monitor and adjust dose. [Moderate] Study
Ezetimibe potentially increases the risk of rhabdomyolysis when given with statins. [Severe] Anecdotal
Fibrates (bezafibrate, cipofibrate) increase the risk of rhabdomyolysis when given with pravastatin. Avoid. [Severe] Study
Fibrates (bezafibrate, cipofibrate) increase the risk of rhabdomyolysis when given with rosuvastatin. Adjust rosuvastatin dose, p. 130. [Severe] Study
Fibrates (bezafibrate, cipofibrate) increase the risk of rhabdomyolysis when given with simvastatin. Adjust simvastatin dose, p. 130. [Severe] Study
Fibrates (fenofibrate) are predicted to increase the risk of rhabdomyolysis when given with fluvastatin. Adjust fenofibrate dose, p. 127. [Severe] Theoretical
Fibrates (fenofibrate) are predicted to increase the risk of rhabdomyolysis when given with pravastatin. Avoid. [Severe] Study
Fibrates (fenofibrate) increase the risk of rhabdomyolysis when given with rosuvastatin. Adjust rosuvastatin dose, p. 130. [Severe] Study
Fibrates (fenofibrate) increase the risk of rhabdomyolysis when given with statins. Avoid. [Severe] Anecdotal
Fibrates (gemfibrozil) increase the risk of rhabdomyolysis when given with statins. Avoid. [Severe] Anecdotal
Fibrates (fenofibrate) increase the risk of rhabdomyolysis when given with atorvastatin. Adjust fenofibrate dose, p. 127. [Severe] Anecdotal
Fusidic acid increases the risk of rhabdomyolysis when given with statins. Avoid. [Severe] Anecdotal
Grapefruit juice increases the exposure to atorvastatin. [Mild] Study
Grapefruit juice increases the exposure to simvastatin. Avoid. [Severe] Study
Grazoprevir increases the exposure to atorvastatin. Adjust atorvastatin dose, p. 128. [Moderate] Study
Grazoprevir is predicted to increase the exposure to fluvastatin. Adjust fluvastatin dose, p. 129. [Unknown] Theoretical
Grazoprevir increases the exposure to rosuvastatin. Adjust rosuvastatin dose, p. 130. [Moderate] Study
Grazoprevir is predicted to increase the exposure to simvastatin. Adjust simvastatin dose, p. 130. [Unknown] Theoretical
HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to atorvastatin. Avoid or adjust dose and monitor rhabdomyolysis. [Severe] Study
HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to simvastatin. [Severe] Study
HIV-protease inhibitors (indinavir) are predicted to increase the exposure to rosuvastatin. Avoid or adjust dose. [Severe] Study
HIV-protease inhibitors (indinavir) are predicted to increase the exposure to simvastatin. Use with caution and adjust simvastatin dose, p. 130. [Severe] Study
Idelalisib is predicted to increase the exposure to atorvastatin. Avoid or adjust dose and monitor rhabdomyolysis. [Severe] Study
Idelalisib is predicted to increase the exposure to simvastatin. Avoid. [Severe] Study
Imatinib is predicted to increase the exposure to atorvastatin. Monitor and adjust dose. [Severe] Theoretical
Imatinib is predicted to increase the exposure to simvastatin. Use with caution and adjust simvastatin dose, p. 130. [Severe] Study
Ledipasvir is predicted to increase the exposure to rosuvastatin. Avoid. [Severe] Theoretical
Ledipasvir is predicted to increase the exposure to statins (atorvastatin, simvastatin). Monitor and adjust dose. [Moderate] Theoretical
Ledipasvir (with sofosbuvir) is predicted to increase the exposure to statins (fluvastatin, pravastatin). Monitor and adjust dose. [Moderate] Theoretical
Lomitapide increases the exposure to atorvastatin. Adjust lomitapide dose or separate administration by 12 hours. [Mild] Study → Also see TABLE 1 p. 818
Lomitapide increases the exposure to simvastatin. Monitor and adjust dose, simvastatin dose, p. 130. [Moderate] Study → Also see TABLE 1 p. 818
Macrolides (clarithromycin) are predicted to increase the exposure to atorvastatin. Avoid or adjust dose and monitor rhabdomyolysis. [Severe] Study
Macrolides (clarithromycin) moderately increase the exposure to pravastatin. [Severe] Study
Macrolides (clarithromycin) are predicted to increase the exposure to simvastatin. Avoid. [Severe] Study
Macrolides (erythromycin) are predicted to increase the exposure to atorvastatin. Monitor and adjust dose. [Severe] Theoretical
Macrolides (erythromycin) are predicted to increase the exposure to pravastatin. [Severe] Study
Macrolides (erythromycin) are predicted to increase the exposure to simvastatin. Use with caution and adjust simvastatin dose, p. 130. [Severe] Study
Monoclonal antibodies (tocilizumab) are predicted to decrease the exposure to atorvastatin. Monitor and adjust dose. [Moderate] Theoretical
Monoclonal antibodies (tocilizumab) moderately decrease the exposure to simvastatin. Monitor and adjust dose. [Moderate] Study
Netupitant is predicted to increase the exposure to atorvastatin. Monitor and adjust dose. [Severe] Theoretical
Netupitant is predicted to increase the exposure to simvastatin. Use with caution and adjust simvastatin dose, p. 130. [Severe] Study
Nevirapine slightly decreases the exposure to atorvastatin. [Mild] Study
Nevirapine moderately decreases the exposure to simvastatin. [Moderate] Study
Nicotinic acid is predicted to increase the risk of rhabdomyolysis when given with statins. [Severe] Theoretical
Nilotinib is predicted to increase the exposure to atorvastatin. Monitor and adjust dose. [Severe] Theoretical
Nilotinib is predicted to increase the exposure to simvastatin. Use with caution and adjust simvastatin dose, p. 130. [Severe] Study
Osimertinib slightly increases the exposure to rosuvastatin. [Moderate] Study
Paritaprevir (with ritonavir and ombitasvir) is predicted to increase the exposure to fluvastatin. Avoid. [Moderate] Theoretical
Paritaprevir (with ritonavir and ombitasvir) increases the exposure to pravastatin. Adjust pravastatin dose, p. 129. [Moderate] Study
Paritaprevir (with ritonavir and ombitasvir) increases the exposure to rosuvastatin. Adjust rosuvastatin dose, p. 130. [Moderate] Study
Rosuvastatin is predicted to increase the anticoagulant effect of phenindione. Monitor INR and adjust dose. [Severe] Theoretical
**Statins (continued)**

- **Ranolazine** is predicted to increase the exposure to atorvastatin. **(Moderate) Theoretical**
  - **Ranolazine** slightly increases the exposure to simvastatin. Adjust simvastatin dose, p. 130. **(Moderate) Study**
  - **Ranolazine** is predicted to increase the exposure to statins (atorvastatin, fluvastatin, rosuvastatin). **(Severe) Theoretical**
  - **Rifampicin** markedly decreases the exposure to atorvastatin. Atorvastatin should be taken at the same time as rifampicin. **(Moderate) Study**
  - **Rifampicin** moderately decreases the exposure to rosvastatin. **(Moderate) Study**
  - **Rifampicin** very markedly decreases the exposure to simvastatin. **(Moderate) Study**
  - **Sacubitril** is predicted to increase the exposure to statins. **(Severe) Study**
  - **Simprevir** moderately increases the exposure to atorvastatin. **(Moderate) Study**
  - **Simprevir** is predicted to increase the exposure to pravastatin. Monitor and adjust dose. **(Severe) Theoretical**
  - **Simprevir** moderately increases the exposure to rosuvastatin. Adjust rosuvastatin dose, p. 130. **(Moderate) Study**
  - **Simprevir** slightly increases the exposure to simvastatin. **(Moderate) Study**
  - **St John’s Wort** slightly decreases the exposure to atorvastatin. **(Mild) Study**
  - **St John’s Wort** moderately decreases the exposure to statins. **(Moderate) Study**
  - **Sulfinpyrazone** is predicted to increase the exposure to fluvastatin. **(Severe) Theoretical**
  - **Fluvastatin** slightly increases the exposure to sulfonylureas (glibenclamide). **(Mild) Study**
  - **Tedizolid** is predicted to increase the exposure to rosvastatin. Avoid. **(Moderate) Theoretical**
  - **Teriflunomide** moderately increases the exposure to rosuvastatin. Adjust rosuvastatin dose, p. 130. **(Moderate) Study**
  - **Ticagrelor** slightly increases the exposure to simvastatin. Adjust simvastatin dose, p. 130. **(Moderate) Study**
  - **Velpatasvir** increases the exposure to rosvastatin. Adjust rosvastatin dose and monitor side effects, p. 130. **(Severe) Study**
  - **Velpatasvir** is predicted to increase the exposure to statins (atorvastatin, simvastatin). Monitor side effects and adjust dose. **(Severe) Theoretical**

**Stavudine** → see TABLE 12 p. 821 (peripheral neuropathy)

- **Didanosine** increases the risk of toxicity when given with stavudine. Avoid. **(Severe) Study**
  - Also see TABLE 12 p. 821
- **Hydroxyurea** increases the risk of toxicity when given with stavudine. Avoid. **(Severe) Study**
  - Also see TABLE 12 p. 821
- **Isoniazid** is predicted to increase the risk of peripheral neuropathy when given with stavudine. **(Severe) Theoretical**
  - Also see TABLE 12 p. 821
- **Ribavirin** increases the risk of toxicity when given with stavudine. Avoid. **(Severe) Study**
- **Zidovudine** is predicted to decrease the efficacy of stavudine. Avoid. **(Severe) Theoretical**

**Stiripentol** → see antiepileptics

**Streptokinase** → see TABLE 3 p. 818 (anticoagulant effects)

**Streptomyacin** → see aminoglycosides

**Strontium ranelate** → see TABLE 5 p. 818 (thromboembolism)

- **Antacids** decrease the absorption of strontium ranelate. Separate administration by 2 hours. **(Moderate) Study**
- **Oral calcium salts** decrease the absorption of strontium ranelate. Separate administration by 2 hours. **(Moderate) Study**
- **Strontium ranelate** is predicted to decrease the absorption of quinolones. Avoid. **(Moderate) Theoretical**
- **Strontium ranelate** is predicted to decrease the absorption of tetracyclines. Avoid. **(Moderate) Theoretical**

**Sucralfate**

- **Sucralfate** potentially decreases the effects of coumarins (warfarin). Separate administration by 2 hours. **(Moderate) Study**
- **Sucralfate** decreases the absorption of digoxin. Separate administration by 2 hours. **(Severe) Anecdotal**
- **Sucralfate** decreases the absorption of dolutegravir. **(Moderate) Study**
- **Sucralfate** increases the risk of blocked enteral or nasogastric tubes when given with enteral feeds. Separate administration by 1 hour. **(Moderate) Study**
- **Sucralfate** decreases the absorption of levothyroxine. Separate administration by at least 4 hours. **(Moderate) Study**
- **Sucralfate** potentially decreases the risk of side-effects when given with sulcralfate. Avoid. **(Moderate) Theoretical**
- **Sucralfate** decreases the exposure to quinolones. Separate administration by 2 hours. **(Moderate) Study**
- **Sodium citrate** is predicted to increase the risk of side-effects when given with sulcralfate. Avoid. **(Moderate) Theoretical**
- **Sucralfate** decreases the absorption of sulpiride. Separate administration by 2 hours. **(Moderate) Study**
- **Sucralfate** potentially decreases the absorption of theophylline. Separate administration by at least 2 hours. **(Moderate) Study**
- **Sucralfate** is predicted to decrease the absorption of tricyclic antidepressants. **(Moderate) Study**

**Sufentanil** → see opioids

**Sugammadex**

- **Sugammadex** is predicted to decrease the exposure to oral combined hormonal contraceptives. Refer to patient information leaflet for missed pill advice. **(Severe) Theoretical**
- **Sugammadex** is predicted to decrease the exposure to medroxyprogesterone. Use additional contraceptive precautions. **(Severe) Theoretical**
- **Sugammadex** is predicted to decrease the exposure to norethisterone. Use additional contraceptive precautions. **(Severe) Theoretical**

**Sulfadiazine** → see sulfonamides

**Sulfamethoxazole**

- **Sulfamethoxazole** increases the anticoagulant effect of coumarins. **(Severe) Study**
- **Sulfasalazine** decreases the absorption of digoxin. **(Moderate) Study**
- **Sulfasalazine** decreases the concentration of digoxin. **(Moderate) Study**
- **Sulfasalazine** decreases the absorption of folic acid. **(Moderate) Study**
- **Sulfasalazine** is predicted to decrease the absorption of folic acid (folic acid). **(Moderate) Theoretical**
- **Tedizolid** is predicted to increase the exposure to sulfasalazine. Avoid. **(Moderate) Theoretical**

**Sulfapyrazine** → see TABLE 4 p. 818 (antiplatelet effects)

- **Sulfapyrazine** increases the concentration of antiepileptics (fosphenytoin, phenytoin). **(Moderate) Study**
- **Aspirin** decreases the effects of sulfapyrazine. **(Moderate) Study**
  - Also see TABLE 4 p. 818
- **Sulfapyrazine** decreases the exposure to calcium channel blockers (verapamil). **(Moderate) Study**
- **Sulfapyrazine** decreases the concentration of ciclosporin. **(Severe) Study**
- **Sulfapyrazine** increases the anticoagulant effect of coumarins. Avoid. **(Severe) Study**
- **Sulfapyrazine** slightly increases the exposure to nateglinide. **(Mild) Study**
- **Pyrazinamide** is predicted to decrease the effects of sulfapyrazine. **(Moderate) Theoretical**
- **Sulfapyrazine** is predicted to increase the exposure to retinoids (alitretinoin). Adjust alitretinoin dose. **(Moderate) Theoretical**
- **Sulfapyrazine** is predicted to increase the exposure to statins (fluvastatin). **(Severe) Theoretical**
- **Sulfapyrazine** is predicted to increase the exposure to sulfonylureas. Use with caution and adjust dose. **(Moderate) Study**
Sulfonamides → see TABLE 15 p. 821 (myelosuppression)

Sulfonamides potentially increase the risk of methaemoglobinemia when given with topical anaesthetics, local (prilocaine). Use with caution or avoid. (Severe) Anecdotal

Sulfadiazine is predicted to increase the concentration of antiepileptics (fosphenytoin). Monitor and adjust dose. (Moderate) Study

Sulfadiazine increases the concentration of antiepileptics (phenytoin). Monitor and adjust dose. (Moderate) Study

Antimalarials (pyrimethamine) increase the risk of side-effects when given with sulfonamides. (Severe) Study → Also see TABLE 15 p. 821

Sulfadiazine is predicted to increase the anticoagulant effect of coumarins. (Severe) Theoretical

Sulfonamides are predicted to increase the risk of methaemoglobinemia when given with dapson. (Severe) Theoretical

Sulfonamides are predicted to increase the exposure to methotrexate. Use with caution or avoid. (Severe) Theoretical → Also see TABLE 15 p. 821

Sulfonamides are predicted to increase the exposure to sulfonylureas. (Moderate) Study

Sulfonamides are predicted to increase the effects of thiopental. (Moderate) Theoretical

Sulfonylureas → see TABLE 14 p. 821 (antidiabetic drugs)

Sulfinpyrazone is predicted to increase the exposure to sulfonylureas. (Severe) Study

Fibrates are predicted to increase the risk of hypoglycaemia when given with sulfonylureas. (Moderate) Theoretical

Macrolides (clarithromycin) are predicted to slightly increase the exposure to sulfonylureas. (Moderate) Theoretical

Rifampicin is predicted to decrease the exposure to sulfonylureas. (Moderate) Study

Statins (fluvastatin) slightly increase the exposure to glibenclamide. (Mild) Study

Sulfinpyrazone is predicted to increase the exposure to sulfonylureas. Use with caution and adjust dose. (Moderate) Study

Sulfonamides are predicted to increase the exposure to sulfonylureas. (Moderate) Study

Sulindac → see NSAIDs

Sulpiride → see TABLE 8 p. 819 (hypotension), TABLE 9 p. 820 (QT-interval prolongation), TABLE 11 p. 820 (CNS depressant effects).

Sulpiride is predicted to decrease the effects of dopamine receptor agonists. Avoid. (Moderate) Theoretical → Also see TABLE 8 p. 819 → Also see TABLE 9 p. 820

Sulpiride is predicted to decrease the effects of levodopa. Avoid. (Severe) Theoretical → Also see TABLE 8 p. 819

Sulpiride potentially increases the risk of neurotoxicity when given with lithium. (Severe) Anecdotal → Also see TABLE 9 p. 820

Sucralfate decreases the absorption of sulpiride. Separate administration by 2 hours. (Moderate) Study

Sumatriptan → see TABLE 13 p. 821 (serotonin syndrome)

Sumatriptan increases the risk of vasoconstriction when given with ergotamine. Ergotamine should be taken at least 24 hours before or 6 hours after sumatriptan. (Severe) Study

Moclobemide moderately increases the exposure to sumatriptan. Avoid. (Moderate) Study → Also see TABLE 13 p. 821

Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the exposure to sumatriptan. Avoid and for 14 days after stopping the MAOI. (Severe) Theoretical → Also see TABLE 13 p. 821

Sunitinib → see TABLE 15 p. 821 (myelosuppression), TABLE 9 p. 820 (QT-interval prolongation)

Antiarhythmic drugs (dronedarone) are predicted to increase the exposure to sunitinib. (Moderate) Theoretical → Also see TABLE 9 p. 820

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to sunitinib. Avoid or adjust sunitinib dose. (Moderate) Study

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to sunitinib. (Moderate) Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to slightly increase the exposure to sunitinib. Avoid or adjust sunitinib dose. (Moderate) Study → Also see TABLE 9 p. 820

Aprepitant is predicted to increase the exposure to sunitinib. (Moderate) Theoretical

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to sunitinib. (Moderate) Study

Cobicistat is predicted to slightly increase the exposure to sunitinib. Avoid or adjust sunitinib dose. (Moderate) Study

Sunitinib is predicted to increase the risk of bleeding events when given with coumarins. (Severe) Theoretical

Crizotinib is predicted to increase the exposure to sunitinib. (Moderate) Theoretical → Also see TABLE 15 p. 821 → Also see TABLE 9 p. 820

Enzalutamide is predicted to decrease the exposure to sunitinib. Avoid or adjust sunitinib dose. (Moderate) Study

Grapefruit juice is predicted to increase the exposure to sunitinib. Avoid. (Moderate) Theoretical

HIV- protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to slightly increase the exposure to sunitinib. Avoid or adjust sunitinib dose. (Moderate) Study → Also see TABLE 9 p. 820

HIV- protease inhibitors (indinavir) are predicted to increase the exposure to sunitinib. (Moderate) Theoretical

Idelalisib is predicted to slightly increase the exposure to sunitinib. Avoid or adjust sunitinib dose. (Moderate) Study → Also see TABLE 15 p. 821

Imatinib is predicted to increase the exposure to sunitinib. (Moderate) Theoretical → Also see TABLE 15 p. 821

Macrolides (clarithromycin) are predicted to slightly increase the exposure to sunitinib. Avoid or adjust sunitinib dose. (Moderate) Study → Also see TABLE 9 p. 820

Macrolides (erythromycin) are predicted to increase the exposure to sunitinib. (Moderate) Theoretical

Netupitant is predicted to increase the exposure to sunitinib. (Moderate) Theoretical

Nilotinib is predicted to increase the exposure to sunitinib. (Moderate) Theoretical → Also see TABLE 15 p. 821 → Also see TABLE 9 p. 820

Sunitinib is predicted to increase the risk of bleeding events when given with phenindione. (Severe) Theoretical

Rifampicin is predicted to decrease the exposure to sunitinib. Avoid or adjust sunitinib dose. (Moderate) Study

Suxamethonium → see TABLE 20 p. 822 (neuromuscular blocking effects)

Alkylating agents (cyclophosphamide) increase the risk of prolonged neuromuscular blockade when given with suxamethonium. (Moderate) Study

Aminoglycosides are predicted to increase the risk of prolonged neuromuscular blockade when given with suxamethonium. (Severe) Theoretical → Also see TABLE 20 p. 822

Antiarhythmics (lidocaine) are predicted to increase the effects of suxamethonium. (Moderate) Study

Anticholinesterases, centrally acting increase the effects of suxamethonium. (Moderate) Theoretical

Antiepileptics (carbamazepine) increase the risk of prolonged neuromuscular blockade when given with suxamethonium. (Moderate) Study

Antiepileptics (fosphenytoin, phenytoin) increase the effects of suxamethonium. (Moderate) Study

Clindamycin increases the effects of suxamethonium. (Severe) Anecdotal

###Tacrolimus

- **Suxamethonium →** See vitamin D substances

###Tacrolimus

- Risk of facial flushing and skin irritation with alcohol consumption in those using topical tacrolimus (does not apply to tacrolimus taken systemically). Pomelo might greatly increase the concentration of tacrolimus.
- Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

###Antihypertensives (amiodarone) and Antihypertensives (dronedarone)

- Are predicted to increase the concentration of tacrolimus. *Severe* Anecdotal
- Are predicted to increase the concentration of tacrolimus. *Severe* Anecdotal

###Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)

- Decrease the concentration of tacrolimus. Monitor and adjust dose. *Severe* Study
- Are predicted to increase the concentration of tacrolimus. Monitor and adjust dose. *Severe* Study
- Are predicted to increase the concentration of tacrolimus. Monitor and adjust dose. *Severe* Study

Interactions

Tacrolimus – Taxanes 961

- **Antifungals, azoles** *(miconazole)* are predicted to increase the concentration of **tacrolimus**. Monitor and adjust dose. *Severe* Theoretical
- **Aprepitant** is predicted to increase the concentration of **tacrolimus**. *Severe* Study
- **Bosantan** is predicted to decrease the concentration of **tacrolimus** and **tacrolimus** potentially increases the concentration of **bosantan**. Avoid. *Severe* Theoretical
- Calcium channel blockers *(diltiazem, verapamil)* are predicted to increase the concentration of **tacrolimus**. *Severe* Study
- Calcium channel blockers *(nicardipine)* potentially increase the concentration of **tacrolimus**. Monitor concentration and adjust dose. *Severe* Theoretical
- **Ceritinib** is predicted to increase the exposure to **tacrolimus**. *Severe* Study
- **Chloramphenicol** increases the concentration of **tacrolimus**. *Severe* Study
- **Ciclosporin** increases the concentration of **tacrolimus**. Avoid. *Severe* Study → Also see **TABLE 2 p. 818** → Also see **TABLE 16 p. 822**
- **Cobicistat** is predicted to increase the concentration of **tacrolimus**. Monitor and adjust dose. *Severe* Study
- **Crixivan** is predicted to increase the concentration of **tacrolimus**. *Severe* Study
- **Danazol** potentially increases the concentration of **tacrolimus**. *Severe* Theoretical
- **Efavirenz** is predicted to decrease the concentration of **tacrolimus**. Monitor and adjust dose. *Moderate* Theoretical
- **Enzalutamide** decreases the concentration of **tacrolimus**. Monitor and adjust dose. *Severe* Study
- **Grapefruit juice** increases the concentration of **tacrolimus**. Avoid. *Severe* Study
- **Grazoprevir** increases the exposure to **tacrolimus**. *Moderate* Study
- **HIV-protease inhibitors** *(atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)* are predicted to increase the concentration of **tacrolimus**. Monitor and adjust dose. *Severe* Study
- **HIV-protease inhibitors** *(indinavir)* are predicted to increase the concentration of **tacrolimus**. *Severe* Study
- **Idelalisib** is predicted to increase the concentration of **tacrolimus**. Monitor and adjust dose. *Severe* Study
- **Imatinib** is predicted to increase the concentration of **tacrolimus**. *Severe* Study
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **tacrolimus**. Public Health England advises avoid. *Severe* Theoretical
- **Macrolides** *(erythromycin)* are predicted to increase the concentration of **tacrolimus**. *Severe* Study
- **Macrolides** *(clarithromycin)* are predicted to increase the concentration of **tacrolimus**. Monitor and adjust dose. *Severe* Study
- **Palbociclib** is predicted to increase the exposure to **tacrolimus**. Adjust dose. *Moderate* Theoretical
- **Pitolisant** is predicted to decrease the exposure to **tacrolimus**. Avoid. *Severe* Theoretical
- **Ranolazine** increases the concentration of **tacrolimus**. Adjust dose. *Severe* Theoretical
- **Rifampin** decreases the concentration of **tacrolimus**. Monitor and adjust dose. *Severe* Study
- **Sirolimus** is predicted to decrease the concentration of **tacrolimus** and **tacrolimus** increases the exposure to **sirolimus**. *Severe* Study
- **St John’s Wort** decreases the concentration of **tacrolimus**. Avoid. *Severe* Study
- **Tacrolimus** potentially increases the risk of serotonin syndrome when given with **venlafaxine**. *Severe* Anecdotal
- **Tadalafil** → see phosphodiesterase type-5 inhibitors
- **Tamoxifen** → see **TABLE 5 p. 818** (thromboembolism)
- **Bupropion** is predicted to decrease the efficacy of **tamoxifen**. Avoid. *Severe* Study
- **Cinacalcet** is predicted to decrease the efficacy of **tamoxifen**. Avoid. *Severe* Study
- **Tamoxifen** increases the anticoagulant effect of **coumarins**. *Unknown* Study
- **Rifampicin** markedly decreases the exposure to **tamoxifen**. *SSRIs* *(fluoxetine, paroxetine)* are predicted to decrease the efficacy of **tamoxifen**. Avoid. *Severe* Study
- **Terbinafine** is predicted to decrease the efficacy of **tamoxifen**. Avoid. *Severe* Study
- **Tamsulosin** → see alpha blockers
- **Tapentadol** → see opioids
- **Taxanes** → see **TABLE 15 p. 821** (myelosuppression), **TABLE 12 p. 821** (peripheral neuropathy)

---

cabazitaxel • docetaxel • paclitaxel

- **Antiarrhythmics** *(dronedarone)* are predicted to increase the exposure to **cabazitaxel**. *Moderate* Theoretical
- **Antiarrhythmics** *(dronedarone)* are predicted to increase the exposure to **paclitaxel**. *Severe* Theoretical
- **Antiepileptics** *(carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)* are predicted to decrease the exposure to **docetaxel**. *Severe* Theoretical → Also see **TABLE 12 p. 821**
- **Antiepileptics** *(carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)* are predicted to decrease the exposure to **taxanes** *(cabazitaxel, paclitaxel)*. Avoid. *Severe* Study → Also see **TABLE 12 p. 821**
- **Antifungals, azoles** *(fluconazole, isavuconazole, posaconazole)* are predicted to increase the exposure to **cabazitaxel**. *Moderate* Theoretical
- **Antifungals, azoles** *(itraconazole, ketoconazole, voriconazole)* are predicted to increase the exposure to **cabazitaxel**. Avoid. *Severe* Study
- **Antifungals, azoles** *(itraconazole, ketoconazole, voriconazole)* are predicted to moderately increase the exposure to **docetaxel**. Avoid or adjust dose. *Severe* Study
- **Antifungals, azoles** *(itraconazole, ketoconazole, voriconazole)* are predicted to increase the exposure to **paclitaxel**. *Severe* Theoretical
- **Antifungals, azoles** *(miconazole)* are predicted to increase the concentration of **docetaxel**. Use with caution and adjust dose. *Moderate* Theoretical
- **Antifungals, azoles** *(miconazole)* are predicted to increase the concentration of **docetaxel**. Avoid or adjust dose. *Severe* Study
- **Calcium channel blockers** *(diltiazem, verapamil)* are predicted to increase the exposure to **cabazitaxel**. *Moderate* Theoretical
- **Bosantan** is predicted to decrease the exposure to **cabazitaxel**. Avoid. *Severe* Study
- **Calcium channel blockers** *(diltiazem, verapamil)* are predicted to increase the exposure to **cabazitaxel**. *Moderate* Theoretical → Also see **TABLE 15 p. 821**
- **Cobicistat** is predicted to increase the exposure to **cabazitaxel**. Avoid. *Severe* Study
- **Cobicistat** is predicted to moderately increase the exposure to **docetaxel**. Avoid or adjust dose. *Severe* Study
- **Cobicistat** is predicted to increase the exposure to **paclitaxel**. *Severe* Theoretical
- **Cobicistat** is predicted to increase the exposure to **paclitaxel**. *Severe* Theoretical
- **Cobicistat** is predicted to increase the exposure to **paclitaxel**. *Severe* Theoretical
- **Crizotinib** is predicted to increase the exposure to **cabazitaxel**. *Moderate* Theoretical → Also see **TABLE 15 p. 821**
- **Efavirenz** is predicted to decrease the exposure to **docetaxel**. Avoid. *Severe* Study
- **Enzalutamide** is predicted to decrease the exposure to **docetaxel**. *Severe* Theoretical
- **Enzalutamide** is predicted to decrease the exposure to **taxanes** *(cabazitaxel, paclitaxel)*. Avoid. *Severe* Study
- **HIV-protease inhibitors** *(atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)* are predicted to increase the exposure to **cabazitaxel**. Avoid. *Severe* Study
**Taxanes – Temsirolimus**

**Interactions**

**Foods and Lifestyle**

- **Fats:** Patients taking tedizolid should avoid consuming large amounts of fatty foods (such as fried fish, fatty meat, cream, and butter).

- **Milk and other dairy products:** Patients should avoid consuming large amounts of dairy products (such as cheese, milk, and yogurt).

**Monoamine oxidase A and B inhibitors**

- **Monoamine-oxidase A inhibitors (selegiline, rasagiline)** are predicted to increase the risk of side-effects when given with tedizolid. **Avoid or adjust dose.**

- **Monoamine-oxidase B inhibitors (safinamide)** are predicted to increase the risk of side-effects when given with tedizolid. **Avoid or adjust dose.**

**Live vaccines**

- **Live vaccines** are predicted to increase the risk of generalised infection when given with tedizolid. **Avoid or adjust dose.**

**Folates**

- **Folates** are predicted to increase the exposure to folates.

**Calcium channel blockers**

- **Calcium channel blockers** are predicted to increase the exposure to calcium channel blockers.

**Antiepileptics**

- **Antiepileptics** are predicted to increase the exposure to antiepileptics.

**Drugs with antihistaminic activity**

- **Antihistamines** are predicted to increase the exposure to antihistamines.

**Tegafur**

- **Tegafur** is predicted to increase the concentration of tegafur.

**Teicoplanin**

**Monoamine-oxidase A inhibitors**

- **Monoamine-oxidase A inhibitors (safinamide)** are predicted to increase the concentration of monoamine-oxidase A inhibitors.

**Methotrexate**

- **Methotrexate** is predicted to decrease the concentration of methotrexate.

**Calcium channel blockers**

- **Calcium channel blockers** are predicted to increase the exposure to calcium channel blockers.

**Antiparkinsonian drugs**

- **Antiparkinsonian drugs** are predicted to increase the concentration of antiparkinsonian drugs.

**Antidepressants**

- **Antidepressants** are predicted to increase the concentration of antidepressants.

**Antihistamines**

- **Antihistamines** are predicted to increase the concentration of antihistamines.

**Anticoagulants**

- **Anticoagulants** are predicted to increase the concentration of anticoagulants.

**Antithrombotics**

- **Antithrombotics** are predicted to increase the concentration of antithrombotics.

**Antihypertensive drugs**

- **Antihypertensive drugs** are predicted to increase the concentration of antihypertensive drugs.

**Antiplatelet drugs**

- **Antiplatelet drugs** are predicted to increase the concentration of antiplatelet drugs.

**Antipsychotics**

- **Antipsychotics** are predicted to increase the concentration of antipsychotics.

**Antianxiety drugs**

- **Antianxiety drugs** are predicted to increase the concentration of antianxiety drugs.

**Anticonvulsants**

- **Anticonvulsants** are predicted to increase the concentration of anticonvulsants.

**Others**

- **Others** are predicted to increase the concentration of others.
Grapefruit juice is predicted to increase the concentration of temsirolimus. Use with caution or avoid.  

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the concentration of temsirolimus. Avoid.  

HIV-protease inhibitors (indinavir) are predicted to increase the concentration of temsirolimus.  

Idelalisib is predicted to increase the concentration of temsirolimus.  

Imatinib is predicted to decrease the absorption of temsirolimus.  

Iron (oral) is predicted to decrease the concentration of temsirolimus. Avoid.  

Live vaccines are predicted to increase the concentration of temsirolimus. Public Health England advises avoid.  

Macrolides (clarithromycin) are predicted to increase the concentration of temsirolimus. Avoid.  

Macrolides (erythromycin) are predicted to increase the concentration of temsirolimus.  

Netupitant is predicted to increase the concentration of temsirolimus.  

Nevirapine is predicted to decrease the concentration of temsirolimus. Avoid.  

Nilotinib is predicted to increase the concentration of temsirolimus.  

Pitolisant is predicted to decrease the absorption to temsirolimus. Avoid.  

Rifampicin is predicted to decrease the concentration of temsirolimus. Avoid.  

St John’s Wort is predicted to decrease the concentration of temsirolimus. Avoid.  

Tenceteplase is predicted to decrease the concentration of temsirolimus. Avoid.  

Terbinafine is predicted to increase the concentration of temsirolimus.  

Tetracyclines should be taken 2 to 3 hours after tetracyclines. See tetracyclines.  

Tetherin decreases the absorption of temsirolimus.  

Velpatasvir increases the exposure to tenofovir.  

Tenoxicam is predicted to increase the exposure to temsirolimus.  

Teriflunomide is predicted to increase the risk of CNS toxicity when given with temsirolimus. Avoid.  

Terbinafine is predicted to moderately increase the exposure to risperidone. Adjust dose.  

Terbinafine is predicted to increase the exposure to SSRIs (citalopram, dapoxetine, escitalopram, fluvoxamine, sertraline).  

Terbinafine is predicted to increase the exposure to SSRIs (fluoxetine). Adjust dose.  

Terbinafine is predicted to increase the exposure to paroxetine.  

Terbinafine is predicted to increase the exposure to vortioxetine. Monitor and adjust dose.  

Terbutaline should be taken 2 to 3 hours after terbutaline. See beta agonists.  

Teriflunomide affects the anticoagulant effect of coumarins. Avoid.  

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with teriflunomide. Public Health England advises avoid.  

Teriflunomide increases the exposure to repaglinide.  

Teriflunomide moderately increases the exposure to statins (rosuvastatin). Adjust rosvastatin dose.  

Tetrabenazine is predicted to increase the effects of levodopa. Use with caution or avoid.  

Tetrabenazine is predicted to increase the risk of CNS toxicity when given with monooamine-oxidase A and B inhibitors, irreversible. Avoid and for 14 days after stopping the MAOI.  

Tetracycline is predicted to increase the absorption of tetracyclines.  

Tetracyclines are predicted to increase the exposure to demeclocycline, doxycycline, lymecycline, minocycline, oxytetracycline, tetracycline, tigecycline.  

ACE inhibitors (quinapril) (tablet) decrease the absorption of oral tetracycline. Avoid.  

Antacids decrease the absorption of tetracyclines. Separate administration by 2 to 3 hours.  

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to doxycycline. Monitor and adjust dose.  

Antimarial agents (atovaquone) decrease the absorption of tetracyclines.  

Calcium salts (calcium carbonate) are predicted to decrease the absorption of tetracyclines. Separate administration by 2 to 3 hours.  

Tetracyclines increase the risk of bleeding events when given with coumarins.  

Dairy products decreases the exposure to tetracyclines (demeclocycline, oxytetracycline, tetracycline). Avoid.  

Iron (oral) decreases the absorption of tetracyclines. Tetracyclines should be taken 2 to 3 hours after iron (oral).  

Lanthanum is predicted to decrease the absorption of tetracyclines. Separate administration by 2 hours.  

Retinoids (acitretin, alitretinoin, isotretinoin, tretinoin) increase the risk of benign intracranial hypertension when given with tetracyclines. Avoid.  

ACE inhibitors (quinapril) (tablet) decrease the absorption of oral tetracycline. Avoid.  

Antacids decrease the absorption of tetracyclines. Separate administration by 2 to 3 hours.  

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to doxycycline. Monitor and adjust dose.  

Antimarial agents (atovaquone) decrease the absorption of tetracyclines.  

Calcium salts (calcium carbonate) are predicted to decrease the absorption of tetracyclines. Separate administration by 2 to 3 hours.  

Tetracyclines increase the risk of bleeding events when given with coumarins.  

Dairy products decreases the exposure to tetracyclines (demeclocycline, oxytetracycline, tetracycline). Avoid.  

Iron (oral) decreases the absorption of tetracyclines. Tetracyclines should be taken 2 to 3 hours after iron (oral).  

Lanthanum is predicted to decrease the absorption of tetracyclines. Separate administration by 2 hours.  

Retinoids (acitretin, alitretinoin, isotretinoin, tretinoin) increase the risk of benign intracranial hypertension when given with tetracyclines. Avoid.  

ACE inhibitors (quinapril) (tablet) decrease the absorption of oral tetracycline. Avoid.  

Antacids decrease the absorption of tetracyclines. Separate administration by 2 to 3 hours.  

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to doxycycline. Monitor and adjust dose.  

Antimarial agents (atovaquone) decrease the absorption of tetracyclines.  

Calcium salts (calcium carbonate) are predicted to decrease the absorption of tetracyclines. Separate administration by 2 to 3 hours.  

Tetracyclines increase the risk of bleeding events when given with coumarins.  

Dairy products decreases the exposure to tetracyclines (demeclocycline, oxytetracycline, tetracycline). Avoid.  

Iron (oral) decreases the absorption of tetracyclines. Tetracyclines should be taken 2 to 3 hours after iron (oral).  

Lanthanum is predicted to decrease the absorption of tetracyclines. Separate administration by 2 hours.  

Retinoids (acitretin, alitretinoin, isotretinoin, tretinoin) increase the risk of benign intracranial hypertension when given with tetracyclines. Avoid.
Tetracyclines (continued)

- **Rifampicin** decreases the exposure to doxycycline. Monitor and adjust dose. [Moderate Study]
- **Strontium ranelate** is predicted to decrease the absorption of tetracyclines. Avoid. [Moderate Theoretical]
- Oral zinc is predicted to decrease the absorption of tetracyclines. Separate administration by 2 to 3 hours. [Moderate Theoretical]

**Thalidomide** → See TABLE 6 p. 819 (bradycardia), TABLE 15 p. 821 (myelosuppression), TABLE 12 p. 821 (peripheral neuropathy), TABLE 5 p. 818 (thromboembolism), TABLE 11 p. 820 (CNS depressant effects)

- **Combined hormonal contraceptives** are predicted to increase the risk of venous thromboembolism when given with thalidomide. Avoid. [Severe Study]
- **Hormone replacement therapy** is predicted to increase the risk of venous thromboembolism when given with thalidomide. [Severe Theoretical]

**Theophylline** → See TABLE 17 p. 822 (reduced serum potassium)

**FOOD AND LIFESTYLE** Smoking can increase theophylline clearance and increased doses of theophylline are therefore required; dose adjustments are unlikely to be necessary if smoking started or stopped during treatment.

- **Aciclovir** is predicted to increase the exposure to theophylline. Monitor theophylline concentration and adjust dose. [Severe Theoretical]
- **Theophylline** decreases the efficacy of **antiarrhythmics (adenosine)**. Separate administration by 24 hours. [Mild Study]
- **Antiepileptics (carbamazepine)** potentially increase the clearance of theophylline and theophylline decreases the exposure to antiepileptics (carbamazepine). Adjust dose. [Moderate Anecdotal]
- **Antiepileptics (fosphenytoin)** are predicted to increase the clearance of theophylline. Adjust dose. [Moderate Study]
- **Antiepileptics (phenobarbital, primidone)** are predicted to increase the clearance of theophylline. Adjust dose. [Moderate Theoretical]
- **Antiepileptics (phenytoin)** are predicted to decrease the exposure to theophylline. Adjust dose. [Moderate Study]
- **Beta blockers, selective** are predicted to increase the risk of bronchospasm when given with theophylline. Avoid. [Severe Theoretical]
- **Caffeine citrate** decreases the clearance of theophylline. [Moderate Study]
- **Combined hormonal contraceptives** are predicted to increase the exposure to theophylline. Monitor and adjust dose. [Moderate Theoretical]
- **Theophylline** increases the risk of agitation when given with doxapram. [Moderate Study]
- **Enteral feeds** decreases the exposure to theophylline. [Moderate Study]
- **H₂ receptor antagonists (cimetidine)** increase the concentration of theophylline. Adjust dose. [Severe Study]
- **HIV-protease inhibitors (ritonavir)** are predicted to decrease the exposure to theophylline. Adjust dose. [Moderate Study]
- **Interferons** slightly increase the exposure to theophylline. Adjust dose. [Moderate Study]
- **Iron chelators (deferasirox)** increase the exposure to theophylline. Avoid. [Moderate Study]
- **Isoniazid** is predicted to affect the clearance of theophylline. [Severe Anecdotal]
- **Theophylline** is predicted to decrease the concentration of lithium. [Moderate Anecdotal]
- **Macrolides (azithromycin, clarithromycin)** are predicted to increase the exposure to theophylline. Adjust dose. [Moderate Anecdotal]
- **Macrolides (erythromycin)** decrease the clearance of theophylline and theophylline potentially decreases the clearance of macrolides (erythromycin). Adjust dose. [Severe Study]
- **Methotrexate** decreases the clearance of theophylline. [Moderate Study]
- **Monoclonal antibodies (blinatumomab)** are predicted to transiently increase the exposure to theophylline. Monitor and adjust dose. [Moderate Theoretical]
- **Pentoxifylline** increases the concentration of theophylline. Monitor and adjust dose. [Severe Study]
- **Quinolones (ciprofloxacin)** are predicted to increase the exposure to theophylline. Monitor and adjust dose. [Moderate Theoretical]
- **Quinolones (norfloxacin)** are predicted to increase the exposure to theophylline. Adjust dose. [Moderate Anecdotal]
- **Rifampicin** is predicted to decrease the exposure to theophylline. [Moderate Study]
- **Theophylline** is predicted to slightly increase the exposure to roflumilast. Avoid. [Moderate Theoretical]
- **SSRIs (fluvoxamine)** moderately to markedly increase the exposure to theophylline. Avoid. [Severe Study]
- **St John’s Wort** potentially decreases the exposure to theophylline. [Severe Anecdotal]
- **Sucralfate** potentially decreases the absorption of theophylline. Separate administration by at least 2 hours. [Moderate Study]
- **Sympathomimetics, vasconstrictor (ephedrine)** increase the risk of side-effects when given with theophylline. Avoid in children. [Moderate Study]
- **Valaciclovir** is predicted to increase the exposure to theophylline. [Severe Theoretical]

**Thiazide diuretics** → See TABLE 18 p. 822 (hypotension), TABLE 8 p. 819 (hypotension), TABLE 17 p. 822 (reduced serum potassium)

- **Bendroflumethiazide** - **chlorothalidone** - **clopamide** - **cyclopenthiazide** - **hydrochlorothiazide** - **hydroflumethiazide** - **indapamide** - **metalazone** - **xipamide**

- **Thiazide diuretics** are predicted to increase the risk of hypersensitivity reactions when given with allopurinol. [Severe Theoretical]
- **Aspirin** (high-dose) increases the risk of acute renal failure when given with thiazide diuretics. [Severe Theoretical]
- **Thiazide diuretics** increase the risk of hypercalcaemia when given with calcium salts. [Severe Anecdotal]
- **Thiazide diuretics** increase the concentration of lithium. Avoid or adjust lithium (lithium carbonate, lithium citrate) dose and monitor lithium (lithium carbonate, lithium citrate) concentration. [Severe Study]
- **NSAIDs** increase the risk of acute renal failure when given with thiazide diuretics. [Severe Theoretical] Also see TABLE 18 p. 822
- **Reboxetine** is predicted to increase the risk of hypokalaemia when given with thiazide diuretics. [Moderate Anecdotal]
- **Thiazide diuretics** are predicted to increase the risk of hypercalcaemia when given with toremifene. [Severe Theoretical]
- **Thiazide diuretics** increase the risk of hypercalcaemia when given with vitamin D substances. [Moderate Theoretical]
- **Thiopental** → See TABLE 8 p. 819 (hypotension), TABLE 11 p. 820 (CNS depressant effects)
- **Sulfonamides** are predicted to increase the effects of thiopental. [Moderate Theoretical]
- **Tricyclic antidepressants** increase the risk of cardiac arrhythmias and hypotension when given with thiopental. [Moderate Study] Also see TABLE 8 p 819
- **Thiopentone** → See alkyating agents
- **Tiagabine** → See antiepileptics
- **Tiaprofenic acid** → See NSAIDs
- **Ticagrelor** → See TABLE 5 p. 818 (thromboembolism)
- **Ticagrelor** → See TABLE 4 p. 818 (antiplatelet effects)
- **Antihypertensives (amlodipine)** are predicted to increase the exposure to ticagrelor. Use with caution or avoid. [Severe Study]
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to markedly decrease the exposure to ticagrelor. Avoid. [Severe Study]
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to markedly increase the exposure to ticagrelor. Avoid. [Severe Study]
- **Bosentan** is predicted to decrease the exposure to ticagrelor. [Moderate Theoretical]
- **Ciclosporin** is predicted to increase the exposure to ticagrelor. Use with caution or avoid. [Severe Study]
Cobicistat is predicted to markedly increase the exposure to ticagrelor. Avoid. [Severe] Study

Ticagrelor increases the concentration of digoxin. [Moderate] Study

Efavirenz is predicted to decrease the exposure to ticagrelor. [Moderate] Theoretical

Enzalutamide is predicted to markedly decrease the exposure to ticagrelor. Avoid. [Severe] Study

Grapefruit juice moderately increases the exposure to ticagrelor. [Moderate] Study

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to markedly increase the exposure to ticagrelor. Avoid. [Severe] Study

Idelalisib is predicted to markedly increase the exposure to ticagrelor. Avoid. [Severe] Study

Ticagrelor is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical

Macrolides (azithromycin) are predicted to increase the exposure to ticagrelor. Use with caution or avoid. [Severe] Study

Macrolides (clarithromycin) are predicted to markedly increase the exposure to ticagrelor. Avoid. [Severe] Study

 Nevirapine is predicted to decrease the exposure to ticagrelor. [Moderate] Theoretical

Ranolazine is predicted to increase the exposure to ticagrelor. Use with caution or avoid. [Severe] Study

Rifampicin is predicted to markedly decrease the exposure to ticagrelor. Avoid. [Severe] Study

St John’s Wort is predicted to decrease the exposure to ticagrelor. [Moderate] Theoretical

Ticagrelor slightly increases the exposure to statins (simvastatin). Adjust simvastatin dose, p. 130. [Moderate] Study

Vemurafenib is predicted to increase the exposure to ticagrelor. Use with caution or avoid. [Severe] Study

Ticarcillin  see penicillins

Tigecycline  see tetracyclines

Timolol  see beta blockers, non-selective

Tinidazole

**FOOD AND LIFESTYLE** Disulfiram-like reaction is predicted to occur on the ingestion of alcohol. Ensure that alcohol is not consumed for 72 hours after stopping tinidazole.

Tinidazole is predicted to increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. [Severe] Theoretical

Tinzaparin  see low molecular-weight heparins

Tigoglu enumer  see TABLE 15 p. 821 (myelosuppression)

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with tigoglu enumer. Public Health England advises avoid. [Severe] Theoretical

Ticlopidine  see TABLE 10 p. 820 (anticoagulants)

Tipranavir  see HIV-protease inhibitors

Tirofiban  see TABLE 4 p. 818 (antiplatelet effects)

Tizanidine  see TABLE 6 p. 819 (bradycardia), TABLE 8 p. 819 (hypotension), TABLE 9 p. 820 (QT-interval prolongation), TABLE 11 p. 820 (CNS depressant effects)

Antiepileptics (fosphenytoin, phenytoin) moderately decrease the exposure to tizanidine. [Mild] Study

Combined hormonal contraceptives increases the exposure to tizanidine. Avoid. [Moderate] Study

HIV-protease inhibitors (ritonavir) moderately decrease the exposure to tizanidine. [Mild] Study

Iron chelators (deferasirox) are predicted to increase the exposure to tizanidine. Avoid. [Moderate] Theoretical

Quinolones (ciprofloxacin) increase the exposure to tizanidine. Avoid. [Moderate] Study

Rifampicin moderately decreases the exposure to tizanidine. [Mild] Study

SSRIs (fluvoxamine) very markedly increase the exposure to tizanidine. Avoid. [Severe] Study

Tobramycin  see aminoglycosides

Tocilizumab  see monoclonal antibodies

Tolbutamide  see sulfonylureas

Tolcapone increases the exposure to levodopa. Monitor and adjust dose. [Moderate] Study

Tolcapone is predicted to increase the effects of monoamine-oxidase A and B inhibitors, irreversible. Avoid. [Severe] Theoretical

Tolcapone is predicted to increase the risk of cardiovascular side-effects when given with sympathomimetics, isotropic (dobutamine, dopamine). [Moderate] Theoretical

Tolcapone is predicted to increase the effects of sympathomimetics, vasconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine). [Moderate] Theoretical

Tolfranil see NSAIDs

**Tolterodine**  see TABLE 9 p. 820 (QT-interval prolongation), TABLE 10 p. 820 (aminosaccharins)

Antiarrhythmics (dronedarone) are predicted to increase the exposure to tolterodine. [Mild] Theoretical  Also see TABLE 9 p. 820

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to tolterodine. [Mild] Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to tolterodine. Avoid. [Severe] Study  Also see TABLE 9 p. 820

Aprepitant is predicted to increase the exposure to tolterodine. [Mild] Theoretical

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to tolterodine. [Mild] Theoretical

Crizotinib is predicted to increase the exposure to tolterodine. Avoid. [Severe] Study  Also see TABLE 9 p. 820

Idelalisib is predicted to increase the exposure to tolterodine. Avoid. [Severe] Study  Also see TABLE 9 p. 820

Imatinib is predicted to increase the exposure to tolterodine. [Mild] Theoretical

Macrolides (clarithromycin) are predicted to increase the exposure to tolterodine. Avoid. [Severe] Study  Also see TABLE 9 p. 820

Macrolides (erythromycin) are predicted to increase the exposure to tolterodine. [Mild] Theoretical

Nilotinib is predicted to increase the exposure to tolterodine. [Mild] Theoretical

Panobinostat is predicted to increase the exposure to tolterodine. [Moderate] Theoretical  Also see TABLE 9 p. 820

Tolvaptan see TABLE 16 p. 822 (increased serum potassium)

**GENERAL INFORMATION** Avoid concurrent use of drugs that increase serum-sodium concentrations.

Antiarrhythmics (dronedarone) are predicted to increase the exposure to tolvaptan. Adjust dose. [Moderate] Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to tolvaptan. Avoid. [Severe] Study

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to tolvaptan. Adjust dose. [Moderate] Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to tolvaptan. Adjust dose. [Severe] Study

Aprepitant is predicted to increase the exposure to tolvaptan. Adjust dose. [Moderate] Theoretical

Bosentan is predicted to decrease the exposure to tolvaptan. [Moderate] Theoretical

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to tolvaptan. Adjust dose. [Moderate] Theoretical

Cobicistat is predicted to increase the exposure to tolvaptan. Adjust dose. [Moderate] Theoretical

Tolvaptan increases the concentration of digoxin. [Mild] Study
Efavirenz is predicted to decrease the exposure to tolvaptan.  
Enzalutamide is predicted to decrease the exposure to tolvaptan. Avoid. (Severe) Study
Grapefruit juice is predicted to increase the exposure to tolvaptan. Avoid. (Moderate) Study
HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to tolvaptan. Adjust dose. (Severe) Study
HIV-protease inhibitors (indinavir) are predicted to increase the exposure to tolvaptan. Adjust dose. (Moderate) Theoretical
Idelalisib is predicted to increase the exposure to tolvaptan. Adjust dose. (Moderate) Theoretical
Tolvaptan is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical
Macrolides (clarithromycin) are predicted to increase the exposure to tolvaptan. Adjust dose. (Severe) Study
Macrolides (erythromycin) are predicted to increase the exposure to tolvaptan. Adjust dose. (Moderate) Theoretical
Netupitant is predicted to increase the exposure to tolvaptan. Adjust dose. (Moderate) Theoretical
Nevirapine is predicted to decrease the exposure to tolvaptan. (Moderate) Theoretical
Nilotinib is predicted to increase the exposure to tolvaptan. Adjust dose. (Moderate) Theoretical
Rifampicin is predicted to decrease the exposure to tolvaptan. Adjust dose. (Moderate) Theoretical
HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to tolvaptan. (Moderate) Theoretical
Idelalisib is predicted to decrease the exposure to tolvaptan. Adjust dose. (Moderate) Theoretical
Vemurafenib is predicted to increase the exposure to tolvaptan. (Severe) Study
Toremifene is predicted to increase the exposure to tolvaptan. (Moderate) Theoretical
Tolvaptan is predicted to increase the exposure to clopidogrel. Avoid or adjust dose. (Moderate) Theoretical
Theoretical
Tolvaptan is predicted to increase the risk of generalised infection (possibly life-threatening) when given with topotecan. Avoid. (Severe) Theoretical
Avoid. (Severe) Study
Topotecan is predicted to increase the exposure to topotecan. (Moderate) Study
Topotecan is predicted to increase the exposure to tolvaptan. Adjust dose. (Moderate) Theoretical
Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to tolvaptan. Adjust dose. (Moderate) Theoretical
Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to tolvaptan. (Moderate) Theoretical
Also see TABLE 9 p. 820
Cobicistat is predicted to increase the exposure to tolvaptan. (Moderate) Theoretical
Enzalutamide is predicted to decrease the exposure to tolvaptan. Adjust dose. (Moderate) Study
HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to tolvaptan. (Moderate) Theoretical
Also see TABLE 9 p. 820
Idelalisib is predicted to increase the exposure to tolvaptan. (Moderate) Theoretical
Macrolides (clarithromycin) are predicted to increase the exposure to tolvaptan. (Moderate) Theoretical
Thiazide diuretics are predicted to increase the concentration of tolvaptan. (Moderate) Theoretical
See antiarrhythmics
Calcium channel blockers (verapamil) are predicted to increase the exposure to topotecan. (Severe) Study
Ciclosporin is predicted to increase the exposure to topotecan. (Severe) Study
Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with topotecan. Public Health England advises avoid. (Severe) Theoretical
Lumacaftor is predicted to affect the exposure to tolvaptan. (Moderate) Theoretical
Macrolides are predicted to increase the exposure to tolvaptan. (Severe) Study
Mirabebron is predicted to increase the exposure to topotecan. (MID) Theoretical
Ranolazine is predicted to increase the exposure to topotecan. (Severe) Study
St John's Wort is predicted to decrease the exposure to tolvaptan. (Moderate) Theoretical
Tolmetin is predicted to decrease the exposure to tolvaptan. Avoid. (Moderate) Theoretical
Vemurafenib is predicted to increase the exposure to topotecan. (Severe) Study
Toremifene is predicted to increase the exposure to tolvaptan. (Moderate) Theoretical
Tramadol see opioids
Trevetibin is predicted to increase the concentration of trametinib. (Moderate) Theoretical
Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the concentration of trametinib. (Moderate) Theoretical
Calcium channel blockers (verapamil) are predicted to increase the concentration of trametinib. (Moderate) Theoretical
Ciclosporin is predicted to increase the concentration of trametinib. (Moderate) Theoretical
HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the concentration of trametinib. (Moderate) Theoretical
Idelalisib is predicted to increase the concentration of trametinib. (Moderate) Theoretical
Topotecan is predicted to increase the concentration of trametinib. (Moderate) Theoretical
Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to tolvaptan. Adjust dose. (Moderate) Theoretical
Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to tolvaptan. (Moderate) Theoretical
Tolvaptan is predicted to increase the anticoagulant effect of coumarins. (Severe) Theoretical
Enzalutamide is predicted to decrease the exposure to tolvaptan. Adjust dose. (Moderate) Study
HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to tolvaptan. (Moderate) Theoretical
Also see TABLE 9 p. 820
Idelalisib is predicted to increase the exposure to tolvaptan. (Moderate) Theoretical
Macrolides (clarithromycin) are predicted to increase the exposure to tolvaptan. (Moderate) Theoretical
Thiazide diuretics are predicted to increase the risk of hypercalcaemia when given with tolvaptan. (Severe) Theoretical
Trabectedin see TABLE 1 p. 818 (hepatotoxicity), TABLE 15 p. 821 (myelosuppression)
Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to trabectedin. Avoid (Severe) Theoretical
Also see TABLE 1 p. 818
Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to trabectedin. Avoid or adjust dose. (Severe) Theoretical
Also see TABLE 1 p. 818
Cobicistat is predicted to increase the exposure to trabectedin. Avoid or adjust dose. (Severe) Theoretical
Enzalutamide is predicted to decrease the exposure to trabectedin. Avoid. (Severe) Theoretical
Trabectedin is predicted to increase the exposure to trabectedin. Avoid. (Severe) Theoretical
Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to trabectedin. Avoid or adjust dose. (Severe) Theoretical
Also see TABLE 1 p. 818
Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to trabectedin. Avoid or adjust dose. (Severe) Theoretical
Tramadol see opioids
Tolvaptan see thrombocytopenia, TABLE 9 p. 820 (thrombocytopenia)
Tranycypromine → see monoamine-oxidase A and B inhibitors, irreversible
Trastuzumab → see monoclonal antibodies
Trastuzumab emtansine → see monoclonal antibodies
Trazedone → see TABLE 13 p. 821 (serotonin syndrome), TABLE 11 p. 820 (CNS depressive effects)
Antiarrhythmics (dronedarone) are predicted to increase the exposure to trazedone. [Moderate] Theoretical
Antiepileptics (carbamazepine) decrease the concentration of trazedone. Adjust dose. [Moderate] Anecdotal
Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to trazedone. [Moderate] Theoretical
Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to trazedone. Avoid or adjust dose. [Moderate] Study
Aprepitant is predicted to increase the exposure to trazedone. [Moderate] Theoretical
Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to trazedone. [Moderate] Theoretical
Cobicistat is predicted to moderately increase the exposure to trazedone. Avoid or adjust dose. [Moderate] Study
Cobicistat is predicted to slightly increase the exposure to tricyclic antidepressants. [Bld] Study
Darifenacin is predicted to increase the exposure to tricyclic antidepressants. [Moderate] Theoretical → Also see TABLE 10 p. 820
Darifenacin is predicted to increase the exposure to tricyclic antidepressants. [Moderate] Study
Tricyclic antidepressants decrease the antihypertensive effects of clonidine. Monitor and adjust dose. [Moderate] Anecdotal → Also see TABLE 8 p. 819
Tricyclic antidepressants are predicted to increase the exposure to tricyclic antidepressants. Monitor and adjust dose. [Moderate] Theoretical → Also see TABLE 13 p. 821
H2 receptor antagonists (cimetidine) increase the exposure to tricyclic antidepressants. [Moderate] Study
Tricyclic antidepressants are predicted to decrease the effects of histamine. Avoid. [Severe] Theoretical → Also see TABLE 8 p. 819
HIV-protease inhibitors (ritonavir, tipranavir) are predicted to increase the exposure to tricyclic antidepressants. [Moderate] Theoretical
Tricyclic antidepressants potentially increase the risk of neurotoxicity when given with lithium. Severe] Anecdotal → Also see TABLE 9 p. 820 → Also see TABLE 13 p. 821
Amitriptyline decreases the effects of metyrapone. Avoid. [Moderate] Theoretical
Tricyclic antidepressants are predicted to increase the effects of moclobemide. Avoid. [Severe] Theoretical → Also see TABLE 13 p. 821
Tricyclic antidepressants are predicted to increase the effects of monoamine-oxidase A and B inhibitors, irreversible. Avoid. [Severe] Theoretical → Also see TABLE 8 p. 819
Tricyclic antidepressants are predicted to decrease the effects of moxonidine. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 819
Tricyclic antidepressants are predicted to decrease the efficacy of pitolisant. [Bld] Theoretical
SSRIs (fluvoxamine, paroxetine) are predicted to increase the exposure to tricyclic antidepressants. Monitor for toxicity and adjust dose. [Severe] Study → Also see TABLE 13 p. 821 → Also see TABLE 18 p. 822
SSRIs (fluvoxamine) markedly increase the exposure to clomipramine. Adjust dose. [Severe] Study → Also see TABLE 18 p. 822 → Also see TABLE 13 p. 821
Sucralfate is predicted to decrease the absorption of tricyclic antidepressants. [Moderate] Study
Tricyclic antidepressants increase the effects of sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine, phenylephrine). Avoid. [Severe] Study
Tricyclic antidepressants are predicted to increase the effects of sympathomimetics, vasoconstrictor (epinephrine). Avoid. [Severe] Study
Tricyclic antidepressants are predicted to decrease the effects of sympathomimetics, vasoconstrictor (ephedrine). Avoid. [Severe] Study
Terbinafine is predicted to increase the exposure to tricyclic antidepressants. Monitor for toxicity and adjust dose. [Severe] Study
Tricyclic antidepressants increase the risk of cardiac arrhythmias and hypotension when given with thiopental. [Moderate] Study → Also see TABLE 8 p. 819
Trientine
Trientine potentially decreases the absorption of iron (oral). [Moderate] Theoretical
Trientine potentially decreases the absorption of zinc. [Moderate] Theoretical
Trifluoperazine → see phenothiazines
Trihexyphenidyl → see TABLE 10 p. 820 (antimuscarinics)
Trimethoprim  → see TABLE 18 p. 822 (hypotraeunia), TABLE 2 p. 818 (nephrotoxicity), TABLE 16 p. 822 (increased serum potassium)
- **Trimethoprim** increases the concentration of antiepileptics (fosphenytoin, phenytoin). [Moderate] Study
- Antimalarials (pyrromethamine) increase the risk of side-effects when given with trimethoprim. [Severe] Study
- **Trimethoprim** is predicted to increase the anticoagulant effect of **coumarins**. [Severe] Study
- **Dapsone** increases the exposure to **trimethoprim** and **trimethoprim** increases the exposure to **dapsone**. [Severe] Study
- **Trimethoprim** increases the concentration of **digoxin**. [Moderate] Study
- **Trimethoprim** slightly increases the exposure to **lamivudine**. [Moderate] Study
- **Trimethoprim** is predicted to increase the risk of side-effects when given with **methotrexate**. Avoid. [Severe] Theoretical → Also see TABLE 2 p. 818
- **Trimethoprim** increases the exposure to **repaglinide**. Avoid or monitor blood glucose. [Moderate] Study
- **Rifampicin** decreases the exposure to **trimethoprim**. [Moderate] Study
- **Trimethoprim** is predicted to decrease the efficacy of **sapropterin**. [Moderate] Theoretical
- **Trimipramine**  → see tricylic antidepressants
- **Tropicamide**  → see TABLE 10 p. 820 (antimuscarnics)
- **Tropium**  → see TABLE 10 p. 820 (antimuscarnics)
- **Typhoid vaccine**  → see live vaccines

**Ulipristal**
- **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Moderate] Study
- **Antiepileptics** (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) decrease the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Anecdotal
- **Antifungals, azoles** (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Moderate] Study
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Severe] Study
- **Antiparkinsonian drugs** (bromocriptine, cabergoline, clozapine, domperidone, levodopa, metoclopramide, polypyrrolidone, quetiapine, risperidone, thioridazine) decrease the efficacy of **ulipristal**. Avoid. [Severe] Theoretical
- **Apantalin** decreases the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Anecdotal
- **Bosentan** decreases the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Anecdotal
- **Calcium channel blockers** (diltiazem, verapamil) are predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Moderate] Study
- **Cobicistat** is predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Severe] Study
- **Eradipine** is predicted to decrease the efficacy of **ulipristal**. Avoid. [Severe] Theoretical
- **Enalapril** decreases the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Anecdotal
- **Enalaprilat** is predicted to markedly decrease the exposure to **ulipristal**. Avoid and for 4 weeks after stopping ulipristal. [Severe] Theoretical
- **Enalaprilat** is predicted to decrease the efficacy of **enalaprilat**. Avoid. [Severe] Theoretical
- **Elosertan** is predicted to decrease the efficacy of **enalaprilat**. Avoid. [Severe] Theoretical
- **Eloba** decreases the efficacy of **enalaprilat**. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Anecdotal
- **Elosertan** is predicted to decrease the efficacy of **enalaprilat**. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Anecdotal
- **Fosaprepitant** decreases the efficacy of **enalaprilat**. Avoid. [Severe] Theoretical
- **Grapefruit juice** is predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Moderate] Theoretical
- **Grapefruit juice** potentially decreases the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Anecdotal
- **HIV-protease inhibitors** (atazanavir, darunavir, fosamprenavir, lopinavir, saquinavir, tipranavir) are predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Severe] Study
- **HIV-protease inhibitors** (indinavir) are predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Severe] Study
- **HIV-protease inhibitors** (ritonavir) decrease the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Anecdotal
- **Idelalisib** is predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Severe] Study
- **Imatinib** is predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Moderate] Study
- **Ulipristal** is predicted to decrease the efficacy of **levonorgestrel**. Avoid. [Severe] Theoretical
- **Macrolides** (clarithromycin) are predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Severe] Study
- **Macrolides** (erythromycin) are predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Moderate] Study
- **Modafinil** decreases the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Anecdotal
- **Netupitant** is predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Moderate] Study
- **Nevirapine** decreases the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Anecdotal
- **Nilotinib** is predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Moderate] Study
- **Ulipristal** is predicted to decrease the efficacy of **nortestosterone**. Avoid. [Severe] Theoretical
- **Rifabutin** decreases the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Anecdotal
- **Rifampicin** decreases the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 474. [Severe] Anecdotal

**Umeclidinium**  → see TABLE 10 p. 820 (antimuscarnics)

**Urokina**se  → see TABLE 3 p. 818 (anticoagulant effects)

**Ursodeoxycholic acid**
- **Antacids** are predicted to decrease the absorption of **ursodeoxycholic acid**. Separate administration by 2 hours. [Moderate] Theoretical
- **Ursodeoxycholic acid** affects the concentration of **cilostazol**. Use with caution and adjust dose. [Severe] Anecdotal
- **Fibates** are predicted to decrease the efficacy of **ursodeoxycholic acid**. Avoid. [Severe] Theoretical
- **Usteatin**umab  → see monoclonal antibodies
- **Valaciclovir**  → see TABLE 2 p. 818 (nephrotoxicity)
- **Valaclovir** is predicted to increase the exposure to **aminophylline**. [Severe] Anecdotal
- **Vanciclovir** is predicted to increase the risk of haematological toxicity when given with **valaciclovir**. [Moderate] Theoretical
- **Valaciclovir** is predicted to increase the exposure to **theophylline**. [Severe] Theoretical
- **Valaciclovir** is predicted to increase the exposure to **didanosine**. [Moderate] Study
- **Mycofenolate** is predicted to increase the risk of haematological toxicity when given with **valaciclovir**. [Moderate] Theoretical
- **Valaciclovir** is predicted to increase the exposure to **theophylline**. [Severe] Theoretical
- **Valaciclovir** is predicted to increase the risk of nephrotoxicity when given with **aminoglycosides**. Avoid. [Moderate] Study
- **Valaciclovir** is predicted to increase the exposure to **didanosine**. [Moderate] Study
- **Vanciclovir** is predicted to increase the exposure to **didanosine**. [Moderate] Study
- **Vanciclovir** is predicted to increase the exposure to **didanosine**. [Moderate] Study
- **Vanciclovir** is predicted to increase the exposure to **didanosine**. [Moderate] Study
Vandetanib  →  see TABLE 9 p. 820 (QT-interval prolongation)
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to vandetanib. Avoid. [Moderate] Study
- **Vandetanib** is predicted to increase the risk of bleeding events when given with coumarins. [Severe] Theoretical
- **Vandetanib** slightly increases the exposure to digoxin. Monitor ECG and adjust dose. [Moderate] Study
- **Enzalutamide** is predicted to decrease the exposure to vandetanib. Avoid. [Moderate] Study
- **Vandetanib** slightly increases the exposure to metformin. Monitor and adjust dose. [Moderate] Study
- **Vandetanib** is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
- **Rifampicin** is predicted to decrease the exposure to vandetanib. Avoid. [Severe] Study
- **Vardenafil** → see phosphodiesterase type-5 inhibitors
- **Varicella-zoster vaccine** → see live vaccines
- **Vecuronium** → see neuromuscular blocking drugs, non-depolarising
- **Vedolizumab** → see monoclonal antibodies

**Velpatasvir**
- **Velpatasvir** is predicted to increase the exposure to aliskiren. [Severe] Theoretical
- **Antacids** are predicted to decrease the concentration of velpatasvir. Separate administration by 4 hours. [Moderate] Study
- **Antiarhythmics (amiodarone)** are predicted to increase the concentration of velpatasvir. Avoid or monitor. [Moderate] Theoretical
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to moderately decrease the exposure to velpatasvir. Avoid. [Severe] Study
- **Velpatasvir** is predicted to increase the exposure to anthistamines, non-sedating (fexofenadine). [Severe] Theoretical
- **Bosantan** is predicted to decrease the exposure to velpatasvir. Avoid. [Moderate] Theoretical
- **Calcium salts (calcium carbonate)** are predicted to decrease the concentration of velpatasvir. Separate administration by 4 hours. [Moderate] Anecdotial
- **Velpatasvir** is predicted to increase the exposure to colchicine. [Severe] Theoretical
- **Velpatasvir** is predicted to increase the exposure to dabigatran. [Severe] Theoretical
- **Velpatasvir** is predicted to increase the exposure to digoxin. [Severe] Study
- **Velpatasvir** is predicted to increase the exposure to edoxaban. [Severe] Theoretical
- **Efavirenz** is predicted to decrease the exposure to velpatasvir. Avoid. [Moderate] Theoretical
- **Enzalutamide** is predicted to moderately decrease the exposure to velpatasvir. Avoid. [Severe] Study
- **Velpatasvir** is predicted to increase the exposure to everolimus. [Severe] Theoretical
- **H₂ receptor antagonists** are predicted to decrease the concentration of velpatasvir. Adjust dose, see sofosbuvir with velpatasvir. [Moderate] Study
- **Velpatasvir** is predicted to increase the exposure to loperamide. [Severe] Theoretical
- **Nevirapine** is predicted to decrease the exposure to velpatasvir. Avoid. [Moderate] Theoretical
- **Proton pump inhibitors** are predicted to decrease the concentration of velpatasvir. Adjust dose, see sofosbuvir with velpatasvir. [Moderate] Study
- **Rifampicin** is predicted to moderately decrease the exposure to velpatasvir. Avoid. [Severe] Study
- **Velpatasvir** is predicted to increase the exposure to sirolimus. [Severe] Theoretical
- **St John’s Wort** is predicted to decrease the exposure to velpatasvir. Avoid. [Moderate] Theoretical
- **Velpatasvir** is predicted to increase the exposure to statins (atorvastatin, simvastatin). Monitor side effects and adjust dose. [Severe] Theoretical
- **Velpatasvir** increases the exposure to statins (rosuvastatin). Adjust rosuvastatin dose and monitor side effects, p. 130. [Severe] Study
- **Velpatasvir** is predicted to increase the exposure to taxanes (paclitaxel). [Severe] Theoretical
- **Velpatasvir** is predicted to increase the exposure to tenofovir. [Moderate] Study
- **Velpatasvir** is predicted to increase the exposure to topotecan. [Severe] Theoretical

**Vemurafenib**  →  see TABLE 9 p. 920 (QT-interval prolongation)
- **Vemurafenib** is predicted to increase the exposure to afatinib. Separate administration by 12 hours. [Moderate] Study
- **Vemurafenib** is predicted to increase the exposure to aliskiren. Use with caution and adjust dose. [Moderate] Theoretical
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to vemurafenib. Avoid. [Severe] Theoretical
- **Antifungals, azoles** are predicted to increase the exposure to efavirenz. [Moderate] Study
- **Aprepitant** (clarithromycin) are predicted to increase the exposure to vemurafenib. Avoid. [Severe] Theoretical
- **Idelalisib** is predicted to increase the exposure to vemurafenib. [Severe] Theoretical  → Also see TABLE 9 p. 820
- **Vemurafenib** is predicted to increase the exposure to beta blockers, non-selective (nadolol). [Moderate] Study
- **Cobicistat** is predicted to increase the exposure to vemurafenib. [Severe] Theoretical
- **Vemurafenib** is predicted to increase the exposure to colchicine. Avoid or adjust colchicine dose. [Severe] Theoretical
- **Vemurafenib** increases the exposure to dabigatran. Use with caution and adjust dose. [Severe] Theoretical
- **Vemurafenib** is predicted to slightly increase the exposure to edoxaban. [Severe] Theoretical
- **Enzalutamide** is predicted to decrease the exposure to vemurafenib. Avoid. [Severe] Theoretical
- **Vemurafenib** is predicted to increase the exposure to erlotinib. [Moderate] Theoretical
- **Vemurafenib** is predicted to increase the exposure to fidafoximic. Avoid. [Moderate] Study
- **HIV-protase inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to increase the exposure to vemurafenib. [Severe] Theoretical  → Also see TABLE 9 p. 820
- **Idelalisib** is predicted to increase the exposure to vemurafenib. [Severe] Theoretical
- **Macroldes (clarithromycin)** are predicted to increase the exposure to vemurafenib. [Severe] Theoretical
- **Macrolides (clarithromycin)** are predicted to increase the exposure to vemurafenib. [Severe] Theoretical  → Also see TABLE 9 p. 820
- **Vemurafenib** is predicted to increase the exposure to nintedanib. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to vemurafenib. Avoid. [Severe] Theoretical
- **Vemurafenib** is predicted to increase the exposure to ticagrelor. Use with caution or avoid. [Severe] Study
- **Vemurafenib** is predicted to increase the exposure to topotecan. [Severe] Study
- **Vemurafenib** is predicted to increase the concentration of trametinib. [Moderate] Theoretical

**Venetoclax**

**FOOD AND LIFESTYLE** Avoid Seville (bitter orange) and star fruit as they might increase the exposure to venetoclax.

- **Antiarhythmics (amiodarone)** are predicted to increase the exposure to venetoclax. Avoid or monitor for toxicity. [Severe] Theoretical
- **Antiarhythmics (dronedarone)** are predicted to increase the exposure to venetoclax. Avoid or adjust venetoclax dose. [Severe] Study
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to venetoclax. Avoid. [Severe] Study
- **Antifungals, azoles** (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the exposure to vemurafenib. Avoid. [Severe] Theoretical
- **Colchicine** is predicted to increase the exposure to venetoclax. Avoid or adjust venetoclax dose. [Severe] Study
- **Cobicistat** is predicted to increase the exposure to venetoclax. [Moderate] Study
- **Cobicistat** is predicted to increase the exposure to venetoclax. [Moderate] Study
- **Enzalutamide** is predicted to decrease the exposure to venetoclax. Avoid. [Severe] Theoretical
- **Idelalisib** is predicted to increase the exposure to vemurafenib. [Severe] Theoretical
- **Idelalisib** is predicted to increase the exposure to vemurafenib. [Severe] Theoretical  → Also see TABLE 9 p. 820
- **Vemurafenib** is predicted to increase the exposure to beta blockers, non-selective (nadolol). [Moderate] Study
- **Nevirapine** is predicted to decrease the exposure to tenofovir. [Moderate] Study
Venetoclax (continued)
- Ciclosporin is predicted to increase the exposure to venetoclax. Avoid or monitor for toxicity. (Severe) Theoretical
- Cobicistat is predicted to increase the exposure to venetoclax. Avoid or adjust venetoclax dose. (Severe) Study
- Venetoclax slightly increases the exposure to coumarins (warfarin). (Moderate) Study
- Crizotinib is predicted to increase the exposure to venetoclax. Avoid or adjust venetoclax dose. (Severe) Study
- Enzalutamide is predicted to decrease the exposure to venetoclax. Avoid. (Severe) Study
- Grapefruit juice is predicted to increase the exposure to venetoclax. Avoid. (Severe) Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to venetoclax. Avoid or adjust venetoclax dose. (Severe) Study
- Idelalisib is predicted to increase the exposure to venetoclax. Avoid or adjust venetoclax dose. (Severe) Study
- Imatinib is predicted to increase the exposure to venetoclax. Avoid or adjust venetoclax dose. (Severe) Study
- Lapatinib is predicted to increase the exposure to venetoclax. Avoid or monitor for toxicity. (Severe) Theoretical
- Venetoclax potentially decreases the efficacy of live vaccines. Avoid. (Severe) Theoretical
- Macrolides (azithromycin) are predicted to increase the exposure to venetoclax. Avoid or monitor for toxicity. (Severe) Theoretical
- Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to venetoclax. Avoid or adjust venetoclax dose. (Severe) Study
- Netupitant is predicted to increase the exposure to venetoclax. Avoid or adjust venetoclax dose. (Severe) Study
- Nitazoxanide is predicted to increase the exposure to venetoclax. Avoid or adjust venetoclax dose. (Severe) Study
- Ranolazine is predicted to increase the exposure to venetoclax. Avoid or monitor for toxicity. (Severe) Theoretical
- Rifampicin is predicted to decrease the exposure to venetoclax. Avoid. (Severe) Study

Venlafaxine → see TABLE 13 p. 821 (serotonin syndrome), TABLE 9 p. 820 (QT-interval prolongation), TABLE 11 p. 820 (CNS depressant effects), TABLE 4 p. 818 (antiplatelet effects)
- Abiraterone potentially increases the exposure to venlafaxine. (Severe) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to venlafaxine. (Moderate) Study → Also see TABLE 9 p. 820
- Cobicistat is predicted to increase the exposure to venlafaxine. (Moderate) Study
- H2 receptor antagonists (cimetidine) slightly increase the exposure to venlafaxine. (Mild) Study
- Venlafaxine slightly increases the exposure to haloperidol. (Severe) Study → Also see TABLE 9 p. 820 → Also see TABLE 11 p. 820
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to venlafaxine. (Moderate) Study → Also see TABLE 9 p. 820
- Idelalisib is predicted to increase the exposure to venlafaxine. (Moderate) Study
- Macrolides (clarithromycin) are predicted to increase the exposure to venlafaxine. (Moderate) Study
- Tacrolimus potentially increases the risk of serotonin syndrome when given with venlafaxine. (Severe) Anecdotal

Verapamil → see calcium channel blockers
Verteporfin

GENERAL INFORMATION  
Caution on concurrent use with other photosensitising drugs.

Vigabatrin → see antiepileptics
Vilanterol → see beta, agonists
Vildagliptin → see TABLE 14 p. 821 (antidiabetic drugs)
Vinblastine → see vinca alkaloids

Vinca alkaloids → see TABLE 1 p. 818 (hepatotoxicity), TABLE 15 p. 821 (myelosuppression), TABLE 19 p. 822 (ototoxicity), TABLE 12 p. 821 (peripheral neuropathy), TABLE 5 p. 818 (thromboembolism), TABLE 9 p. 820 (QT-interval prolongation)

vinblastine · vincristine · vindesine · vinflunine · vinorelbine

**Antarrhythmics (dronedarone)** are predicted to increase the exposure to vinca alkaloids. (Severe) Theoretical → Also see TABLE 9 p. 820

**Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to vinflunine. Avoid. (Severe) Theoretical → Also see TABLE 12 p. 821

**Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to vinorelbine. Use with caution or avoid. (Severe) Theoretical

**Venlafaxine** → see vinca alkaloids

**Vindesine** → see vinca alkaloids

**Vinflunine** → see vinca alkaloids
Vinorelbine → see vinca alkaloids
Vismodegib → see TABLE 15 p. 821 (myelosuppression)
- Antiepileptics (Carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to vismodegib. Avoid. [Moderate] Theoretical
- Enzalutamide is predicted to decrease the exposure to vismodegib. Avoid. [Moderate] Theoretical
- Rifampicin is predicted to decrease the exposure to vismodegib. Avoid. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the exposure to vismodegib. Avoid. [Moderate] Theoretical

Vitamin A
- Retinoids (acetretin, altretinoin, isoretinoin) are predicted to increase the risk of vitamin A toxicity when given with vitamin A. Avoid. [Severe] Theoretical
- Retinoids (bexarotene) are predicted to increase the risk of toxicity when given with vitamin A. Adjust dose. [Moderate] Theoretical
- Retinoids (tretinoin) are predicted to increase the risk of vitamin A toxicity when given with vitamin A. Avoid. [Severe] Study

Vitamin D substances
- alfalcacidol - calcitriol - calcitriol - colecalciferol - dihydrotachysterol - ergocalciferol - paricalcitol - tacalcitol
- Antiepileptics (carbamazepine) are predicted to decrease the effects of vitamin D substances. [Moderate] Study
- Antiepileptics (fosphenytoin, phenytoin) decrease the effects of vitamin D substances. [Moderate] Study
- Antiepileptics (phenobarbital, primidone) are predicted to decrease the effects of vitamin D substances. [Moderate] Theoretical
- Antifungals, azoles (clotrimazole, ketoconazole) are predicted to decrease the exposure to colecalciferol. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to paricalcitol. [Moderate] Study
- Cobisicat is predicted to increase the exposure to paricalcitol. [Moderate] Study

Vitamin D substances are predicted to increase the risk of toxicity when given with digoxin. [Severe] Theoretical
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to paricalcitol. [Moderate] Study
- Idelalisib is predicted to increase the exposure to paricalcitol. [Moderate] Study
- Macrolides (clarithromycin) are predicted to increase the exposure to paricalcitol. [Moderate] Study
- Thiazide diuretics increase the risk of hypercalcaemia when given with vitamin D substances. [Moderate] Theoretical

Vitamin E substances
- alpha tocopherol - alpha tocopheryl acetate
- Vitamin E substances affect the exposure to ciclosporin. [Moderate] Study

Volatile halogenated anaesthetics → see TABLE 8 p. 819 (hypotension), TABLE 11 p. 820 (CNS depressant effects)
- desflurane - isoflurane - sevoflurane

Voriconazole → see antifungals, azoles
Vortioxetine → see TABLE 13 p. 821 (serotonin syndrome), TABLE 4 p. 818 (antiplatelet effects)
- Antiepileptics (Carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to vortioxetine. Monitor and adjust dose. [Moderate] Study
- Bupropion is predicted to increase the exposure to vortioxetine. Monitor and adjust dose. [Moderate] Study → Also see TABLE 13 p. 821
- Cinacalcet is predicted to increase the exposure to vortioxetine. Monitor and adjust dose. [Moderate] Study
- Enzalutamide is predicted to decrease the exposure to vortioxetine. Monitor and adjust dose. [Moderate] Study
- Rifampicin is predicted to decrease the exposure to vortioxetine. Monitor and adjust dose. [Moderate] Study
- SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to vortioxetine. Monitor and adjust dose. [Moderate] Study → Also see TABLE 13 p. 821 → Also see TABLE 4 p. 818
- Terbinafine is predicted to increase the exposure to vortioxetine. Monitor and adjust dose. [Moderate] Study
- Warfarin → see coumarins
- Wasp venom extract

GENERAL INFORMATION Desensitising vaccines should be avoided in patients taking beta-blockers (adrenaline might be ineffective in case of a hypersensitivity reaction) or ACE inhibitors (risk of severe anaphylactoid reactions).

Xipamide → see thiadiazi diuretics
Xylometazoline → see sympathomimetics, vasoconstrictor
Yellow fever vaccine, live → see live vaccines
Zaloplone → see TABLE 11 p. 820 (CNS depressant effects)
- Rifampicin markedly decreases the exposure to zaleplon. [Moderate] Study

Zidovudine → see TABLE 15 p. 821 (myelosuppression), TABLE 2 p. 818 (nephrotoxicity)
- Antiepileptics (valproate) slightly increase the exposure to zidovudine. [Moderate] Study
- Antimalarial (pyrimethamine) are predicted to increase the risk of side-effects when given with zidovudine. [Severe] Theoretical → Also see TABLE 15 p. 821
- Zidovudine increases the risk of haematological toxicity when given with aspirin (high-dose). [Severe] Study
- HIV-protease inhibitors (tipranavir) slightly decrease the exposure to zidovudine. Avoid. [Moderate] Study
- Macrolides (clarithromycin) decrease the absorption of zidovudine. Separate administration by at least 2 hours. [Moderate] Study
- Nevirapine is predicted to decrease the concentration of zidovudine. Refer to specialist literature. [Severe] Theoretical
- Zidovudine increases the risk of haematological toxicity when given with NSAI Ds. [Severe] Study → Also see TABLE 2 p. 818
- Ribavirin increases the risk of anaemia and/or leucopenia when given with zidovudine. Avoid. [Severe] Study
- Zidovudine is predicted to decrease the efficacy of stavudine. Avoid. [Severe] Theoretical

Zinc
- Oral zinc decreases the absorption of oral bisphosphonates (alendronic acid). Zinc should be taken at least 30 minutes before alendronic acid. [Moderate] Study
- Oral zinc is predicted to decrease the absorption of oral bisphosphonates (ibandronic acid). Avoid zinc for at least 6 hours before or 1 hour after ibandronic acid. [Moderate] Theoretical
- Oral zinc decreases the absorption of oral bisphosphonates (risendronate). Separate administration by at least 2 hours. [Moderate] Study
- Oral zinc decreases the absorption of oral bisphosphonates (sodium clodronate). Avoid zinc for 2 hours before or 1 hour after sodium clodronate. [Moderate] Study
- Oral calcium salts decrease the absorption of zinc. [Moderate] Study
- Zinc is predicted to decrease the absorption of eltroambogap. Ertomabogap should be taken 2 hours before or 4 hours after zinc. [Severe] Theoretical
- Zinc is predicted to decrease the efficacy of iron (oral) and iron (oral) is predicted to decrease the efficacy of zinc. [Moderate] Study
- Zinc is predicted to decrease the absorption of penicillamine. [Mild] Theoretical
- Zinc is predicted to decrease the exposure to quinolones. Separate administration by 2 hours. [Moderate] Study
- Oral zinc is predicted to decrease the absorption of tetracyclines. Separate administration by 2 to 3 hours. [Moderate] Theoretical
- Trientine potentially decreases the absorption of zinc. [Severe] Theoretical
- Zoledronic acid → see bisphosphonates
Zolmitriptan → see TABLE 13 p. 821 (serotonin syndrome)
- Combined hormonal contraceptives are predicted to increase the exposure to zolmitriptan. Adjust zolmitriptan dose, p. 280. [Moderate] Theoretical
Zolmitriptan (continued)

- **H<sub>3</sub> receptor antagonists (cimetidine)** slightly increase the exposure to zolmitriptan. Adjust zolmitriptan dose, p. 280. [Mild] Study
- **Modafinil** slightly increases the exposure to zolmitriptan. Adjust zolmitriptan dose, p. 280. [Moderate] Study → Also see TABLE 13 p. 821
- **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the exposure to zolmitriptan. [Severe] Theoretical → Also see TABLE 13 p. 821
- **Quinolones (ciprofloxacin)** are predicted to increase the exposure to zolmitriptan. Adjust zolmitriptan dose, p. 280. [Moderate] Theoretical
- **SSRIs (fluvoxamine)** are predicted to increase the exposure to zolmitriptan. Adjust zolmitriptan dose, p. 280. [Severe] Theoretical → Also see TABLE 13 p. 821
- **Zolpidem** → also see TABLE 11 p. 820 (CNS depressant effects)
- **Antiepileptics (carbamazepine)** moderately decrease the exposure to zolpidem. [Moderate] Study
- **Rifampicin** moderately decreases the exposure to zolpidem. [Moderate] Study
- **Zonisamide** → also see antiepileptics
- **Zopiclone** → also see TABLE 11 p. 820 (CNS depressant effects)
- **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Study
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to zopiclone. Adjust dose. [Moderate] Study → Also see TABLE 11 p. 820
- **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Study
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Theoretical
- **Aprepitant** is predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Study
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to zopiclone. [Moderate] Study
- **Cobicistat** is predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Theoretical
- **Crizotinib** is predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Study
- **Enzalutamide** is predicted to decrease the exposure to zopiclone. Adjust dose. [Moderate] Study
- **HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Theoretical
- **HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Study
- **Idelalisib** is predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Theoretical
- **Imatinib** is predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Study
- **Macrolides (clarithromycin)** are predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Theoretical
- **Macrolides (erythromycin)** are predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Study
- **Netupitant** is predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Study
- **Nilotinib** is predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to zopiclone. Adjust dose. [Moderate] Study

Zucloppenthixol → see TABLE 8 p. 819 (hypotension), TABLE 9 p. 820 (QT-interval prolongation), TABLE 11 p. 820 (CNS depressant effects)

- Zucloppenthixol is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 819 → Also see TABLE 9 p. 820
- Zucloppenthixol is predicted to decrease the effects of histamine. Avoid. [Severe] Theoretical → Also see TABLE 8 p. 819
- Zucloppenthixol is predicted to decrease the effects of levodopa. Avoid or monitor worsening parkinsonian symptoms. [Severe] Theoretical → Also see TABLE 8 p. 819
Appendix 2
Borderline substances

Special additives for conditions of intolerance 1002
Nutritional supplements for metabolic diseases 1009
Glutaric aciduria (type 1) 1009
Glycogen storage disease 1009
Homocystinuria or hypermethioninaemia 1009
Hyperlysinaemia 1010
Isovaleric acidemia 1010
Maple syrup urine disease 1010
Methylmalonic or propionic acidemia 1011
Other inborn errors of metabolism 1011
Phenylketonuria 1012
Tyrosinaemia 1014
Feed thickeners and pre-thickened drinks 1002
Flavouring preparations 1003
Foods for special diets 1003
Gluten-free foods 1003
Low-protein foods 1006
Nutritional supplements for metabolic diseases 1009

In certain conditions some foods (and toilet preparations) have characteristics of drugs and the Advisory Committee on Borderline Substances (ACBS) advises as to the circumstances in which such substances may be regarded as drugs. Prescriptions issued in accordance with the Committee’s advice and endorsed ‘ACBS’ will normally not be investigated.

Information
General Practitioners are reminded that the ACBS recommends products on the basis that they may be regarded as drugs for the management of specified conditions. Doctors should satisfy themselves that the products can safely be prescribed, that patients are adequately monitored and that, where necessary, expert hospital supervision is available.

Foods which may be prescribed on FP10, GP10 (Scotland), or WP10 (Wales)
All the food products listed in this appendix have ACBS approval. The clinical condition for which the product has been approved is included with each entry.
Note: Foods included in this appendix may contain cariogenic sugars and patients should be advised to take appropriate oral hygiene measures.

Enteral feeds and supplements
For most enteral feeds and nutritional supplements, the main source of carbohydrate is either maltodextrin or glucose syrup; other carbohydrate sources are listed in the relevant table, below. Feeds containing residual lactose (less than 1 g lactose/100 mL formula) are described as ‘clinically lactose-free’ or ‘lactose-free’ by some manufacturers. The presence of lactose (including residual lactose) in feeds is indicated in the relevant table, below. The primary sources of protein or amino acids are included with each product entry. The fat or oil content is derived from a variety of sources such as vegetables, soya bean, corn, palm nuts, and seeds; where the fat content is derived from animal or fish sources, this information is included in the relevant table, below. The presence of medium chain triglycerides (MCT) is also noted where the quantity exceeds 30% of the fat content. Enteral feeds and nutritional supplements can contain varying amounts of vitamins, minerals, and trace elements—the manufacturer’s product literature should be consulted for more detailed information. Feeds containing vitamin K may affect the INR in patients receiving warfarin; see Interactions: Appendix 1: enteral feeds.

The suitability of food products for patients requiring a vegan, kosher, halal, or other compliant diet should be confirmed with individual manufacturers.
Note: Feeds containing more than 6 g/100 mL protein or 2 g/100 mL fibre should be avoided in children unless recommended by an appropriate specialist or dietician.

Nutritional values
Nutritional values of products vary with flavour and pack size—consult product literature.

Paediatric ACBS indications: Disease-related malnutrition, intractable malabsorption, growth failure, pre-operative preparation of malnourished patients, dysphagia, short-bowel syndrome, bowel fistula

Standard ACBS indications: Disease-related malnutrition, intractable malabsorption, pre-operative preparation of malnourished patients, dysphagia, proven inflammatory bowel disease, following total gastrectomy, short-bowel syndrome, bowel fistula

Other conditions for which ACBS products can be prescribed
This is a list of clinical conditions for which the ACBS has approved toilet preparations. For details of preparations see Chapter 13.

Dermatitis, eczema and pruritus
Aveeno® Bath Oil; Aveeno® Cream; Aveeno® Lotion; E45® Emollient Bath Oil; E45® Emollient Wash Cream; E45® Lotion
Disfiguring skin lesions (birthmarks, mutilating lesions, scars, vitiligo)
Covermark® classic foundation and finishing powder; Dermablend® Ultra corrective foundation; Dermacolor® Camouflage cream and fixing powder; Keromask® masking cream and finishing powder; Veil® Cover cream and Finishing Powder. (Cleansing Creams, Cleansing Milks, and Cleansing Lotions are excluded).

**Disinfectants (antiseptics)**
May be prescribed on an FP10 only when ordered in such quantities and with such directions as are appropriate for the treatment of patients, but not for general hygienic purposes.

**Dry mouth (xerostomia)**
For patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome, AS Saliva Orthana®; Biòtène Oralbalance®; Glandosane®; Saliveze®

**Photodermatoses (skin protection in)**
Anthelios® XL SPF 50+ Melt-in cream; Sunsense® Ultra; Uvistat® Lipscreen SPF 50, Uvistat® Suncream SPF 30 and 50

Prices quoted in Appendix 2 are basic NHS net prices; for further information see Prices in BNFC.

Feed additives

Special additives for conditions of intolerance

Colieff®
- For the relief of symptoms associated with lactose intolerance in infants, provided that lactose intolerance is confirmed by the presence of reducing substances and/or excessive acid in stools, a low concentration of the corresponding disaccharide enzyme on intestinal biopsy or by breath hydrogen test or lactose intolerance test. For dosage and administration details, consult product literature. LQUID, lactase 50 000 units/g. Colieff 50,000 units/g infant drops (Forum Health Products Ltd) 7 ml (ACBS) - NHS indicative price = £8.40

Fructose
- (Laevulose) For proven glucose/galactose intolerance

Glucose
- (Dextrose monohydrate) For use as an energy supplement in sucrase-isomaltase deficiency

VSL®
- Nutritional supplement for use under the supervision of a physician, for the maintenance of remission of ileoanal pouchitis induced by antibacterials in adults. For dosage and administration details, consult product literature. POWDER, containing 8 strains of live, freeze-dried, lactic acid bacteria. Contains traces of soya, gluten, and lactose.

VSL® Probiotic Food Supplement oral powder 4.4g sachets (Ferring Pharmaceuticals Ltd) 30 sachet (ACBS) - NHS indicative price = £34.36

Feed thickeners and pre-thickened drinks

Carobel, Instant®
- For thickening feeds in the treatment of vomiting. POWDER, carob seed flour. Instant Carobel powder (Cow & Gate Ltd) 153 gram (ACBS) - NHS indicative price = £2.91

Multi-thick®
- For thickening of liquids and foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive. POWDER, modified maize starch, gluten- and lactose-free. Multi-thick powder (Abbott Laboratories Ltd) 250 gram (ACBS) - NHS indicative price = £4.83

Nutilis® Clear
- For thickening of liquids or foods in dysphagia. Not suitable for children under 5 years. POWDER, maltodextrin, xanthan gum, guar gum, gluten- and lactose-free. Nutilis Clear powder (Nutrícia Ltd) 72 gram (ACBS) - NHS indicative price = £11.04 | 175 gram (ACBS) - NHS indicative price = £8.46

Nutilis® Powder
- For thickening of foods in dysphagia. Not suitable for children under 5 years. POWDER, carbohydrate 86g, energy 1520 kJ (358 kcal)/100 g, modified maize starch, gluten- and lactose-free. Nutilis powder (Nutrícia Ltd) 240 gram (ACBS) - NHS indicative price = £6.80 | 300 gram (ACBS) - NHS indicative price = £5.11

Resource® Thickened Drink
- For dysphagia. Not suitable for children under 1 year. LIQUID, carbohydrate 22 g, energy: orange 382 kJ (90 kcal); apple 376 kJ (89 kcal)/100 mL. Gluten- and lactose-free. Resource Thickened Drink custard apple (Nestle Health Science) 114 ml (ACBS) - NHS indicative price = £0.73

Resource Thickened Drink custard orange (Nestle Health Science) 114 ml (ACBS) - NHS indicative price = £0.73

Resource Thickened Drink syrup apple (Nestle Health Science) 114 ml (ACBS) - NHS indicative price = £0.73

Resource Thickened Drink syrup orange (Nestle Health Science) 114 ml (ACBS) - NHS indicative price = £0.73

Resource® Thickunup®
- For thickening of foods in dysphagia. Not suitable for children under 1 year. POWDER, modified maize starch. Gluten- and lactose-free. Resource Thickunup powder (Nestle Health Science) 227 gram (ACBS) - NHS indicative price = £4.66 | 337.5 gram (ACBS) - NHS indicative price = £17.86

Resource® Thickunup Clear
- For thickening of liquids or foods in dysphagia. Not suitable for children under 3 years. POWDER, maltodextrin, xanthan gum, gluten- and lactose-free. Resource Thickunup Clear powder (Nestle Health Science) 28.8 gram (ACBS) - NHS indicative price = £5.28 | 125 gram (ACBS) - NHS indicative price = £8.46

SLO Drinks®
- Nutritional supplement for patient hydration in the dietary management of dysphagia. Not suitable for children under 3 years. POWDER, carbohydrate content varies with flavour and chosen consistency (3 consistencies available), see product literature. SLO Drink 1 oral powder lemon (SLO Drinks Ltd) 25 cup (ACBS) - NHS indicative price = £7.50

SLO Drink 1 oral powder orange (SLO Drinks Ltd) 25 cup (ACBS) - NHS indicative price = £7.50

SLO Drink 1 oral powder hot chocolate (SLO Drinks Ltd) 25 cup (ACBS) - NHS indicative price = £7.50

SLO Drink 2 oral powder hot chocolate (SLO Drinks Ltd) 25 cup (ACBS) - NHS indicative price = £7.50

SLO Drink 2 oral powder lemon (SLO Drinks Ltd) 25 cup (ACBS) - NHS indicative price = £7.50

SLO Drink 2 oral powder orange (SLO Drinks Ltd) 25 cup (ACBS) - NHS indicative price = £7.50

SLO Milkshakes®
- Nutritional supplement in the dietary management of dysphagia. Not suitable for children under 3 years. POWDER, carbohydrate content varies with flavour and chosen consistency (3 consistencies available), see product literature. SLO Milkshake+ 1 oral powder chocolate (SLO Drinks Ltd) 50 gram (ACBS) - NHS indicative price = £5.88

SLO Milkshake+ 1 oral powder strawberry (SLO Drinks Ltd) 50 gram (ACBS) - NHS indicative price = £5.88

SLO Milkshake+ 2 oral powder hot chocolate (SLO Drinks Ltd) 50 gram (ACBS) - NHS indicative price = £5.88

SLO Milkshake+ 2 oral powder strawberry (SLO Drinks Ltd) 50 gram (ACBS) - NHS indicative price = £5.88

SLO ThickenUp Clear
- For thickening of foods in dysphagia. Not suitable for children under 1 year. POWDER, modified maize starch. Gluten- and lactose-free. Thicken Aid (M & A Pharmachem Ltd) 225 gram (ACBS) - NHS indicative price = £5.21 | 900 gram (ACBS) - NHS indicative price = £32.00 | 4540 gram (ACBS) - NHS indicative price = £87.18

Thicken Aid (Fresenius Kabi Ltd) 225 gram (ACBS) - NHS indicative price = £5.21 | 900 gram (ACBS) - NHS indicative price = £32.00 | 4540 gram (ACBS) - NHS indicative price = £87.18

Thick & Easy®
- For thickening of foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive. POWDER Modified maize starch

Thick & Easy (SLO Drinks Ltd) 225 gram (ACBS) - NHS indicative price = £5.21 | 900 gram (ACBS) - NHS indicative price = £32.00 | 4540 gram (ACBS) - NHS indicative price = £87.18

Thixo-D®
- For thickening of foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive. POWDER, modified maize starch, gluten-free. Thixo-D powder (Sutherland Health Ltd) 375 gram (ACBS) - NHS indicative price = £7.65
Flavouring preparations

**Flavour Mix^{®}**
- POWDER
  - For use with Vitafo’s range of unflavoured protein substitutes for metabolic diseases; not suitable for child under 3 years.

**FlavourPac^{®}**
- POWDER
  - For thickening of foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive.

  - 474 gram (ACBS) - NHS indicative price = £5.47

**Ener-G gluten free tapioca bread** (General Dietary Ltd)
  - 480 gram (ACBS) - NHS indicative price = £5.47

**Ener-G gluten free rice loaf** (General Dietary Ltd)
  - 612 gram (ACBS) - NHS indicative price = £5.47

**Ener-G gluten free Seattle brown loaf** (General Dietary Ltd)
  - 454 gram (ACBS) - NHS indicative price = £6.22

**Ener-G gluten free white rice bread** (General Dietary Ltd)
  - 456 gram (ACBS) - NHS indicative price = £5.47

**Genius Gluten Free^{®} Loaf**

**Genius gluten free brown bread sliced** (Genius Foods Ltd)
  - 400 gram (ACBS) - NHS indicative price = £2.88

**Genius gluten free brown bread unsliced** (Genius Foods Ltd)
  - 400 gram (ACBS) - NHS indicative price = £2.77

**Genius gluten free brown sandwich bread sliced** (Genius Foods Ltd)
  - 535 gram (ACBS) - NHS indicative price = £3.73

**Genius gluten free white bread sliced** (Genius Foods Ltd)
  - 400 gram (ACBS) - NHS indicative price = £2.88

**Genius gluten free white bread unsliced** (Genius Foods Ltd)
  - 400 gram (ACBS) - NHS indicative price = £2.77

**Genius gluten free white sandwich bread sliced** (Genius Foods Ltd)
  - 535 gram (ACBS) - NHS indicative price = £3.73

**Glutafin^{®} Loaves**

**Glutafin gluten free fibre loaf sliced** (Dr Schar UK Ltd)
  - 300 gram (ACBS) - NHS indicative price = £2.89

**Gluten gluten free white loaf sliced** (Dr Schar UK Ltd)
  - 300 gram (ACBS) - NHS indicative price = £2.89

**Glutafin^{®} Select Loaves**

**Glutafin gluten free Select fibre loaf sliced** (Dr Schar UK Ltd)
  - 400 gram (ACBS) - NHS indicative price = £3.43

**Glutafin gluten free Select fresh brown loaf sliced** (Dr Schar UK Ltd)
  - 400 gram (ACBS) - NHS indicative price = £3.43

**Glutafin gluten free Select fresh white loaf sliced** (Dr Schar UK Ltd)
  - 400 gram (ACBS) - NHS indicative price = £3.43

**Glutafin gluten free Select seeded loaf sliced** (Dr Schar UK Ltd)
  - 400 gram (ACBS) - NHS indicative price = £3.72

**Glutafin gluten free Select white loaf sliced** (Dr Schar UK Ltd)
  - 400 gram (ACBS) - NHS indicative price = £3.43

**Juvela^{®} Loaf**

**Juvela gluten free fresh fibre loaf sliced** (Hero UK Ltd)
  - 400 gram (ACBS) - NHS indicative price = £3.39

**Juvela gluten free fresh white loaf sliced** (Hero UK Ltd)
  - 400 gram (ACBS) - NHS indicative price = £3.69

**Juvela gluten free fibre loaf sliced** (Hero UK Ltd)
  - 400 gram (ACBS) - NHS indicative price = £3.54

**Juvela gluten free part baked loaf** (Hero UK Ltd)
  - 400 gram (ACBS) - NHS indicative price = £3.95

**Juvela gluten free part baked fibre loaf** (Hero UK Ltd)
  - 400 gram (ACBS) - NHS indicative price = £3.80

**Juvela gluten free loaf unsliced** (Hero UK Ltd)
  - 400 gram (ACBS) - NHS indicative price = £3.54

**Juvela gluten free fibre loaf unsliced** (Hero UK Ltd)
  - 400 gram (ACBS) - NHS indicative price = £3.54

**Lifestyle^{®} Loaf**

**Lifestyle gluten free brown bread sliced** (Ultrapharm Ltd)
  - 400 gram (ACBS) - NHS indicative price = £2.82

**Lifestyle gluten free high fibre bread sliced** (Ultrapharm Ltd)
  - 400 gram - NHS indicative price = £2.82

**Lifestyle gluten free white bread sliced** (Ultrapharm Ltd)
  - 400 gram (ACBS) - NHS indicative price = £2.82

**Warburtons^{®} Loaf**

**Warburtons gluten free bread sliced** (Warburtons Ltd)
  - 400 gram (ACBS) - NHS indicative price = £3.06

**Warburtons gluten free white bread sliced** (Warburtons Ltd)
  - 400 gram (ACBS) - NHS indicative price = £3.06
Appendix 2

Borderline substances

GLUTEN-FREE

Juvela gluten free fresh fibre rolls
220 gram (ACBS) - NHS indicative price = £2.55

Wellfoods gluten free bread rolls (Wellfoods Ltd)
380 gram (ACBS) - NHS indicative price = £4.03

Wellfoods gluten free rolls (Wellfoods Ltd)
360 gram (ACBS) - NHS indicative price = £3.73

Cereals

Juvela Fibre flakes and oats
GLUTEN-FREE

Juvela gluten free fibre flakes (Hero UK Ltd)
300 gram (ACBS) - NHS indicative price = £2.78

Juvela gluten free flakes (Hero UK Ltd)
300 gram (ACBS) - NHS indicative price = £2.78

Juvela gluten free pure oats (Hero UK Ltd)
500 gram (ACBS) - NHS indicative price = £2.78

Nairns Porridge
GLUTEN-FREE

Nairns gluten free oat porridge (Nairns Oatcakes Ltd)
500 gram (ACBS) - NHS indicative price = £3.05

Cookies and biscuits

Barkat Biscuits
GLUTEN-FREE

Barkat gluten free digestive biscuits (Gluten Free Foods Ltd)
175 gram (ACBS) - NHS indicative price = £2.61

Barkat gluten free coffee biscuits (Gluten Free Foods Ltd)
200 gram (ACBS) - NHS indicative price = £3.38

Glutafin Cookies and biscuits
GLUTEN-FREE

Glutafin gluten free tea biscuits (Dr Schar UK Ltd)
150 gram (ACBS) - NHS indicative price = £2.09

Glutafin gluten free digestive biscuits (Dr Schar UK Ltd)
150 gram (ACBS) - NHS indicative price = £2.13

Glutafin gluten free shortbread biscuits (Dr Schar UK Ltd)
100 gram (ACBS) - NHS indicative price = £1.73

Juvela Biscuits
GLUTEN-FREE

Juvela gluten free digestive biscuits (Hero UK Ltd)
150 gram (ACBS) - NHS indicative price = £3.05

Juvela gluten free savoury biscuits (Hero UK Ltd)
150 gram (ACBS) - NHS indicative price = £3.82

Juvela gluten free sweet biscuits (Hero UK Ltd)
150 gram (ACBS) - NHS indicative price = £2.88

Juvela gluten free tea biscuits (Hero UK Ltd)
150 gram (ACBS) - NHS indicative price = £3.05

Crackers, crispbreads, and breadsticks

Barkat Crackers
GLUTEN-FREE

Barkat gluten free matzo crackers (Gluten Free Foods Ltd)
200 gram (ACBS) - NHS indicative price = £3.52

Glutafin Crackers
GLUTEN-FREE

Glutafin gluten free high fibre crackers (Dr Schar UK Ltd)
200 gram (ACBS) - NHS indicative price = £2.90

Glutafin gluten free crackers (Dr Schar UK Ltd)
200 gram (ACBS) - NHS indicative price = £3.46

Glutafin gluten free mini crackers (Dr Schar UK Ltd)
175 gram (ACBS) - NHS indicative price = £2.96

Wellfoods Loaf
GLUTEN-FREE

Wellfoods gluten free loaf sliced (Wellfoods Ltd)
600 gram (ACBS) - NHS indicative price = £5.05

Wellfoods gluten free loaf unsliced (Wellfoods Ltd)
600 gram (ACBS) - NHS indicative price = £4.95

BAGUETTES, BUNS AND ROLLS

Barkat Baguettes and rolls
GLUTEN-FREE

Barkat gluten free par baked rolls (Gluten Free Foods Ltd)
200 gram (ACBS) - NHS indicative price = £2.98

Barkat gluten free par baked baguettes (Gluten Free Foods Ltd)
200 gram (ACBS) - NHS indicative price = £2.98

Ener-G Rolls
GLUTEN-FREE

Ener-G gluten free dinner rolls (General Dietary Ltd)
280 gram (ACBS) - NHS indicative price = £3.71

Ener-G gluten free white round rolls (General Dietary Ltd)
220 gram (ACBS) - NHS indicative price = £2.98

Ener-G gluten free white long rolls (General Dietary Ltd)
220 gram (ACBS) - NHS indicative price = £2.98

Glutafin Baguettes and rolls
GLUTEN-FREE

Glutafin gluten free baguettes (Dr Schar UK Ltd)
350 gram (ACBS) - NHS indicative price = £3.51

Glutafin gluten free 4 white rolls (Dr Schar UK Ltd)
200 gram (ACBS) - NHS indicative price = £3.68

Glutafin gluten free part baked 4 fibre rolls (Dr Schar UK Ltd)
200 gram (ACBS) - NHS indicative price = £3.68

Glutafin Select Rolls
GLUTEN-FREE

Glutafin gluten free part baked 4 white rolls (Dr Schar UK Ltd)
200 gram (ACBS) - NHS indicative price = £3.68

Glutafin gluten free part baked 2 long white rolls (Dr Schar UK Ltd)
150 gram (ACBS) - NHS indicative price = £2.81

Juvela Rolls
GLUTEN-FREE

Juvela gluten free fresh fibre rolls (Hero UK Ltd)
425 gram (ACBS) - NHS indicative price = £4.42

Juvela gluten free fresh white rolls (Hero UK Ltd)
425 gram (ACBS) - NHS indicative price = £4.42

Juvela gluten free fibre bread rolls (Hero UK Ltd)
425 gram (ACBS) - NHS indicative price = £4.77

Juvela gluten free bread rolls (Hero UK Ltd)
425 gram (ACBS) - NHS indicative price = £4.77

Juvela gluten free part baked fibre bread rolls (Hero UK Ltd)
375 gram (ACBS) - NHS indicative price = £4.94

Juvela gluten free part baked white bread rolls (Hero UK Ltd)
375 gram (ACBS) - NHS indicative price = £4.94

Lifestyle Rolls
GLUTEN-FREE

Lifestyle gluten free brown bread rolls (Ultrapharm Ltd)
400 gram (ACBS) - NHS indicative price = £2.82

Lifestyle gluten free high fibre bread rolls (Ultrapharm Ltd)
400 gram (ACBS) - NHS indicative price = £2.82

Lifestyle gluten free white bread rolls (Ultrapharm Ltd)
400 gram (ACBS) - NHS indicative price = £2.82

Procel Baguettes, buns and rolls
GLUTEN-FREE

Procel gluten free part baked baguettes (Ambe Ltd)
250 gram (ACBS) - NHS indicative price = £3.24

Warburtons Baguettes and rolls
GLUTEN-FREE

Warburtons gluten free baguettes (Warburtons Ltd)
150 gram (ACBS) - NHS indicative price = £2.86

Warburtons gluten free brown rolls (Warburtons Ltd)
220 gram (ACBS) - NHS indicative price = £2.55

Warburtons gluten free white rolls (Warburtons Ltd)
220 gram (ACBS) - NHS indicative price = £2.55

Wellfoods Buns and rolls
GLUTEN-FREE

Wellfoods gluten free burger buns (Wellfoods Ltd)
380 gram (ACBS) - NHS indicative price = £4.03

Wellfoods gluten free rolls (Wellfoods Ltd)
360 gram (ACBS) - NHS indicative price = £3.73

Glutafin gluten free high fibre crackers (Gluten Free Foods Ltd)
200 gram (ACBS) - NHS indicative price = £2.90

Glutafin gluten free crackers (Dr Schar UK Ltd)
200 gram (ACBS) - NHS indicative price = £3.46

Glutafin gluten free mini crackers (Dr Schar UK Ltd)
175 gram (ACBS) - NHS indicative price = £2.96

Lifestyle gluten free high fibre bread rolls
400 gram (ACBS) - NHS indicative price = £2.82

  - **Rizopia gluten free organic brown rice pasta spaghetti** (PGR Health Foods Ltd)
    - 500 gram (ACBS) - NHS indicative price = £2.72

### Pizza bases

- **Barkat®, Pizza crust**
  - **Gluten-free**
  - **Barkat gluten free brown rice pizza crust** (Gluten Free Foods Ltd)
    - 150 gram (ACBS) - NHS indicative price = £5.00
  - **Barkat gluten free white rice pizza crust** (Gluten Free Foods Ltd)
    - 150 gram (ACBS) - NHS indicative price = £5.00
- **Glutafin® Pizza base**
  - **Gluten-free**
  - **Glutafin gluten free pizza base** (Dr Schar UK Ltd)
    - 300 gram (ACBS) - NHS indicative price = £6.56
  - **Juvela® Pizza base**
    - **Juvela gluten free pizza base** (Hero UK Ltd)
      - 360 gram (ACBS) - NHS indicative price = £8.78
  - **Procell® Pizza base**
    - **Procell gluten free pizza base** (Ambe Ltd)
      - 250 gram (ACBS) - NHS indicative price = £3.90
- **Wellfoods® Pizza base**
  - **Wellfoods gluten free pizza base** (Wellfoods Ltd)
    - 600 gram (ACBS) - NHS indicative price = £9.13

### Gluten- and wheat-free foods

**ACBS indications:** established gluten-sensitive enteropathies with coexisting established wheat sensitivity only.

- **Ener-G® Bread loaves, rolls and pizza bases**
  - **Gluten-free**, **Wheat-free**
- **Ener-G gluten free Seattle brown hamburger rolls** (General Dietary Ltd)
  - 320 gram (ACBS) - NHS indicative price = £4.08
- **Glutafin® Flour mix, fibre and crispbread**
  - **Gluten-free**, **Wheat-free**
- **Glutafin gluten free crispbread** (Dr Schar UK Ltd)
  - 150 gram (ACBS) - NHS indicative price = £3.25
- **Glutafin gluten free bread mix** (Dr Schar UK Ltd)
  - 500 gram (ACBS) - NHS indicative price = £6.66
- **Glutafin gluten free fibre bread mix** (Dr Schar UK Ltd)
  - 500 gram (ACBS) - NHS indicative price = £6.66
- **Glutafin gluten free wheat free fibre mix** (Dr Schar UK Ltd)
  - 500 gram (ACBS) - NHS indicative price = £6.66
- **Heron Foods® Flour mixes**
  - **Gluten-free**, **Wheat-free**
- **Heron gluten free organic bread mix** (Gluten Free Foods Ltd)
  - 500 gram (ACBS) - NHS indicative price = £8.96

### Low-protein foods

**ACBS indications:** inherited metabolic disorders, renal or liver failure, requiring a low-protein diet

- **Ener-G® Rice bread**
  - **Low Protein**
Appendix 2

**Foods for special diets**

**Ener-G low protein rice bread** (General Dietary Ltd)
600 gram (ACBS) - NHS indicative price = £5.60

**Juvela® Loaf and rolls**
LOW PROTEIN

**Juvela gluten free loaf sliced** (Hero UK Ltd)
400 gram (ACBS) - NHS indicative price = £3.54

**Juvela low protein bread rolls** (Hero UK Ltd)
350 gram (ACBS) - NHS indicative price = £4.52

**Juvela low protein loaf sliced** (Hero UK Ltd)
400 gram (ACBS) - NHS indicative price = £3.64

**Loprofin® Bread**
LOW PROTEIN

**Loprofin low protein part baked bread rolls** (Nutricia Ltd)
260 gram (ACBS) - NHS indicative price = £4.20

**Loprofin low protein part baked loaf sliced** (Nutricia Ltd)
400 gram (ACBS) - NHS indicative price = £3.98

**PK Foods® Loaf**
LOW PROTEIN

**PK Foods low protein white bread sliced** (Gluten Free Foods Ltd)
300 gram - NHS indicative price = £4.75

**Cake, biscuits, and snacks**

**Juvela® Cookies**
LOW PROTEIN

**Juvela low protein cinnamon cookies** (Hero UK Ltd)
125 gram (ACBS) - NHS indicative price = £7.62

**Juvela low protein chocolate chip cookies** (Hero UK Ltd)
110 gram (ACBS) - NHS indicative price = £7.62

**Juvela low protein orange cookies** (Hero UK Ltd)
125 gram (ACBS) - NHS indicative price = £7.62

**Loprofin® Wafers**
LOW PROTEIN

**Loprofin low protein crackers** (Nutricia Ltd)
150 gram (ACBS) - NHS indicative price = £3.67

**Loprofin low protein herb crackers** (Nutricia Ltd)
150 gram (ACBS) - NHS indicative price = £3.67

**Loprofin low protein vanilla cream wafers** (Nutricia Ltd)
100 gram (ACBS) - NHS indicative price = £2.62

**PK Foods® Biscuits**
LOW PROTEIN

**PK Foods Aminex low protein biscuits** (Gluten Free Foods Ltd)
200 gram (ACBS) - NHS indicative price = £5.04

**PK Foods Aminex low protein cookies** (Gluten Free Foods Ltd)
150 gram (ACBS) - NHS indicative price = £5.04

**PK Foods Aminex low protein rusk** (Gluten Free Foods Ltd)
200 gram (ACBS) - NHS indicative price = £5.04

**PK Foods low protein chocolate chip cookies** (Gluten Free Foods Ltd)
150 gram (ACBS) - NHS indicative price = £5.04

**PK Foods low protein cinnamon cookies** (Gluten Free Foods Ltd)
150 gram (ACBS) - NHS indicative price = £5.04

**PK Foods low protein crispbread** (Gluten Free Foods Ltd)
75 gram (ACBS) - NHS indicative price = £2.42

**PK Foods low protein orange cookies** (Gluten Free Foods Ltd)
150 gram (ACBS) - NHS indicative price = £5.04

**Promin® cooked and flavoured pasta snax**
LOW PROTEIN

**Promin low protein Snax salt & vinegar 25g sachets** (Firstplay Dietary Foods Ltd)
3 sachet - No NHS indicative price available | 12 sachet (ACBS) - NHS indicative price = £10.58

**Promin low protein Snax ready salted 25g sachets** (Firstplay Dietary Foods Ltd)
3 sachet - No NHS indicative price available | 12 sachet (ACBS) - NHS indicative price = £10.58

**Promin low protein Snax cheese & onion 25g sachets** (Firstplay Dietary Foods Ltd)
3 sachet - No NHS indicative price available | 12 sachet (ACBS) - NHS indicative price = £10.58

**Taranis® Cake bars**
LOW PROTEIN

**Taranis low protein apricot cake** (Lactalis Nutrition Sante)
240 gram (ACBS) - NHS indicative price = £6.08

**Taranis low protein lemon cake** (Lactalis Nutrition Sante)
240 gram (ACBS) - NHS indicative price = £6.08

**Taranis low protein pear cake** (Lactalis Nutrition Sante)
240 gram (ACBS) - NHS indicative price = £6.08

**Vita Bite®**

Not recommended for any child under 1 year.
LOW PROTEIN. Bar, protein 30 mg (less than 2.5 mg phenylalanine), carbohydrate 15.35 g, fat 8.4 g, energy 572 kJ (137 kcal)/25 g.

**VitaBite bar** (Vitaflor International Ltd)
175 gram (ACBS) - NHS indicative price = £8.77

**Vitaflor Choices® Mini crackers**
LOW PROTEIN

**Vitaflor Choices mini crackers** (Vitaflor International Ltd)
40 gram (ACBS) - NHS indicative price = £0.87

**Cereals**

**Loprofin® Breakfast cereal**
LOW PROTEIN

**Loprofin low protein breakfast cereal flakes apple** (Nutricia Ltd)
375 gram (ACBS) - NHS indicative price = £8.09

**Loprofin low protein breakfast cereal flakes chocolate** (Nutricia Ltd)
375 gram (ACBS) - NHS indicative price = £8.09

**Loprofin low protein breakfast cereal flakes strawberry** (Nutricia Ltd)
375 gram (ACBS) - NHS indicative price = £8.09

**Loprofin low protein breakfast cereal loops** (Nutricia Ltd)
375 gram (ACBS) - NHS indicative price = £8.39

**Promin® Hot breakfast**
LOW PROTEIN

**Promin low protein hot breakfast powder sachets apple & cinnamon** (Firstplay Dietary Foods Ltd)
342 gram (ACBS) - NHS indicative price = £8.09

**Promin low protein hot breakfast powder sachets banana** (Firstplay Dietary Foods Ltd)
342 gram (ACBS) - NHS indicative price = £8.09

**Promin low protein hot breakfast powder sachets chocolate** (Firstplay Dietary Foods Ltd)
342 gram (ACBS) - NHS indicative price = £8.09

**Promin low protein hot breakfast powder sachets original** (Firstplay Dietary Foods Ltd)
336 gram (ACBS) - NHS indicative price = £8.09

**Desserts**

**PK Foods® Jelly**
LOW PROTEIN

**PK Foods low protein jelly mix dessert cherry** (Gluten Free Foods Ltd)
320 gram (ACBS) - NHS indicative price = £8.03

**PK Foods low protein jelly mix dessert orange** (Gluten Free Foods Ltd)
320 gram (ACBS) - NHS indicative price = £8.03

**Promin® Desserts**
LOW PROTEIN

**Promin low protein imitation rice pudding apple** (Firstplay Dietary Foods Ltd)
276 gram (ACBS) - NHS indicative price = £6.33

**Promin low protein imitation rice pudding banana** (Firstplay Dietary Foods Ltd)
276 gram (ACBS) - NHS indicative price = £6.33

**Promin low protein imitation rice pudding original** (Firstplay Dietary Foods Ltd)
276 gram (ACBS) - NHS indicative price = £6.33

Nutritional supplements for metabolic diseases

Glutaric aciduria (type 1)

**GA1 Anamix® Infant**
- Nutritional supplement for the dietary management of proven glutaric aciduria (type 1) in children from birth to 3 years. POWDER, protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

**GA1 Maxamaid powder (Nutricia Ltd)**
- 500 gram (ACBS) · NHS indicative price = £99.61

**GA1 Maxamaid powder (Nutricia Ltd)**
- 500 gram (ACBS) · NHS indicative price = £99.61

**XLYS, TRY Glutaridon®**
- Nutritional supplement for the dietary management of type 1 glutaric aciduria in children and adults; requires additional source of vitamins, minerals, and trace elements. POWDER, protein equivalent (essential and non-essential amino acids except lysine and tryptophan) 79 g, carbohydrate 4 g, energy 1411 kJ (332 kcal)/100 g.

Glycosade®
- A nutritional supplement for use in the dietary management of glycogen storage disease and other metabolic conditions where a constant supply of glucose is essential. Not suitable for use in children under 2 years. POWDER, protein 200 mg, carbohydrate (maize starch) 47.6 g, fat 100 mg, fibre less than 600 mg, energy 803 kJ (192 kcal)/60 g.

**Glycosade oral powder 60g sachets (Vitaflor International Ltd)**
- 50 sachet (ACBS) · NHS indicative price = £113.77

Homocystinuria or hypermethioninaemia

**HCU Anamix® Infant**
- Nutritional supplement for the dietary management of proven vitamin B6 non-responsive homocystinuria or hypermethioninaemia in children from birth to 3 years. POWDER, protein equivalent (essential and non-essential amino acids except methionine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

**HCU Anamix Infant powder (Nutricia Ltd)**
- 400 gram (ACBS) · NHS indicative price = £39.45

**HCU cooler® 15**
- A methionine-free protein substitute for use as a nutritional supplement in children over 3 years with homocystinuria. LIQUID, protein (essential and non-essential amino acids except methionine) 15 g, carbohydrate 7 g, fat 500 mg, energy 393 kJ (92 kcal)/150 mL, with vitamins, minerals, and trace elements.

**HCU orange cooler 15 liquid (Vitaflor International Ltd)**
- 130 ml (ACBS) · NHS indicative price = £11.42

**HCU Express® 15**
- A methionine-free protein substitute for use as a nutritional supplement in children over 8 years with homocystinuria. POWDER, protein (essential and non-essential amino acids except methionine) 15 g, carbohydrate 3.8 g, fat 30 mg, energy 315 kJ (75.3 kcal)/25 g with vitamins, minerals, and trace elements. To flavourunflavoured products, see FlavourPac p. 1003.

**HCU express 15 oral powder 25g sachets (Vitaflor International Ltd)**
- 30 sachet (ACBS) · NHS indicative price = £336.16

**HCU Express® 20**
- A methionine-free protein substitute for use as a nutritional supplement in children over 8 years with homocystinuria. POWDER, protein (essential and non-essential amino acids except methionine) 20 g, carbohydrate 4.7 g, fat 70 mg, energy 416 kJ (99 kcal)/34 g with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1003.

**HCU express 20 oral powder 34g sachets (Vitaflor International Ltd)**
- 30 sachet (ACBS) · NHS indicative price = £434.31

**HCU gel®**
- A methionine-free protein substitute for use as a nutritional supplement for the dietary management of children 1–10 years with homocystinuria. POWDER, protein (essential and non-essential amino acids except methionine) 10 g, carbohydrate 10.5 g, fat 20 mg, energy 339 kJ (81 kcal)/24 g with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1003.

**HCU gel oral powder 24g sachets (Vitaflor International Ltd)**
- 30 sachet (ACBS) · NHS indicative price = £218.42

**HCU Lophlex® LQ 20**
- Nutritional supplement for the dietary management of homocystinuria in children over 3 years. LIQUID, protein equivalent (essential and non-essential amino acids except methionine) 20 g, carbohydrate 8.8 g, fat 440 mg, energy 509 kJ (120 kcal)/125 mL, with vitamins, minerals, and trace elements.
Isovaleric acidaemia

**IVA Anamix® Infant**
- Nutritional supplement for the dietary management of proven isovaleric acidaemia or other proven disorders of leucine metabolism in children from birth to 3 years.

**POWDER**, protein equivalent (essential and non-essential amino acids except leucine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

**IVA Anamix Infant powder** (Nutricia Ltd)
- 400 gram (ACBS) - NHS indicative price = £39.45

**IVA Maxamaid®**
- Nutritional supplement for the dietary management of isovaleric acidaemia.

**POWDER**, protein equivalent (essential and non-essential amino acids except leucine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g with vitamins, minerals, and trace elements. Maxamaid products are generally intended for use in children 1-8 years.

**IVA Maxamaid powder** (Nutricia Ltd)
- 500 gram (ACBS) - NHS indicative price = £99.61

Maple syrup urine disease

**MSUD Aid III®**
- Nutritional supplement for the dietary management of maple syrup urine disease and related conditions in children and adults where it is necessary to limit the intake of branched chain amino acids.

**POWDER**, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g.

**MSUD Aid I11 powder** (Nutricia Ltd)
- 500 gram (ACBS) - NHS indicative price = £188.69

**MSUD Anamix® Infant**
- Nutritional supplement for the dietary management of proven maple syrup urine disease in children from birth to 3 years.

**POWDER**, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

**MSUD Anamix Infant powder** (Nutricia Ltd)
- 400 gram (ACBS) - NHS indicative price = £39.45

**MSUD Anamix® Junior**
- Nutritional supplement for the dietary management of maple syrup urine disease in children 1–10 years.

**POWDER**, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 8.4 g, carbohydrate 11 g, fat 3.9 g, energy 474 kJ (113 kcal)/29 g sachet, with vitamins, minerals, and trace elements.

**MSUD Anamix Junior oral powder 36g sachets** (Nutricia Ltd)
- 50 sachets (ACBS) - NHS indicative price = £210.90

**MSUD Anamix® Junior LQ**
- Nutritional supplement for the dietary management of maple syrup urine disease in children 1–10 years.

**LIQUID**, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 10 g, carbohydrate 8.8 g, fat 4.8 g, fibre 310 mg, energy 497 kJ (118 kcal)/125 mL, with vitamins, minerals, and trace elements. Lactose-free.

**MSUD Anamix Junior LQ liquid** (Nutricia Ltd)
- 125 ml (ACBS) - NHS indicative price = £9.15
Nutritional supplement for the dietary management of maple syrup urine disease in children over 3 years and adults. LIQUID, protein equivalent (essential and non-essential amino acids except leucine, isoleucine, and valine) 15 g, carbohydrate 7.3 g, fat 500 mg, energy 393 kJ (92 kcal)/150–mL pouch, with vitamins, minerals, and trace elements.

**MSUD cooler® 15**
- Nutritional supplement for the dietary management of maple syrup urine disease in children over 8 years and adults.
- POWDER, protein equivalent (essential and non-essential amino acids except leucine, isoleucine, and valine) 15 g, carbohydrate 3.8 g, fat less than 100 mg, energy 515 kJ (125 kcal)/25 g, with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1003.

**MSUD express® 15**
- Nutritional supplement for the dietary management of maple syrup urine disease in children over 8 years and adults.
- POWDER, protein equivalent (essential and non-essential amino acids except leucine, isoleucine, and valine) 20 g, carbohydrate 4.7 g, fat less than 100 mg, energy 416 kJ (99 kcal)/54 g, with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1003.

**MSUD express 15 oral powder 25g sachets** (Vitafo International Ltd) 30 sachet (ACBS) - NHS indicative price = £236.16

**MSUD express® 20**
- Nutritional supplement for the dietary management of maple syrup urine disease in children over 8 years and adults.
- POWDER, protein equivalent (essential and non-essential amino acids except leucine, isoleucine, and valine) 20 g, carbohydrate 4.7 g, fat less than 100 mg, energy 416 kJ (99 kcal)/54 g, with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1003.

**MSUD express 20 oral powder 34g sachets** (Vitafo International Ltd) 30 sachet (ACBS) - NHS indicative price = £434.31

**MSUD Gel®**
- Nutritional supplement for the dietary management of maple syrup urine disease in children 1–10 years.
- POWDER, protein equivalent (essential and non-essential amino acids except leucine, isoleucine, and valine) 10 g, carbohydrate 10.3 g, fat less than 100 mg, energy 359 kJ (81 kcal)/24 g, with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1003.

**MSUD gel 24g sachets** (Vitafo International Ltd) 30 sachet (ACBS) - NHS indicative price = £218.96

**MSUD Lophelix® LQ 20**
- Nutritional supplement for the dietary management of maple syrup urine disease in children over 5 years.
- LIQUID, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 20 g, carbohydrate 8.8 g, fat less than 500 mg, energy 509 kJ (120 kcal)/125 mL with vitamins, minerals, and trace elements.

**MSUD Lophelix LQ 20 liquid** (Nutricia Ltd) 125 mL (ACBS) - NHS indicative price = £16.27

**MSUD Maxamaid®**
- Nutritional supplement for the dietary management of maple syrup urine disease.
- POWDER, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 77 g, carbohydrate 5.1 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Maxamaid products are generally intended for use in children 1–8 years.

**MSUD Maxamaid powder unflavoured** (Nutricia Ltd) 500 gram (ACBS) - NHS indicative price = £159.66

**Methylmalonic or propionic acidaemia**

**MMA/PA Anamix® infant**
- Nutritional supplement for the dietary management of proven methylmalonic acidaemia or propionic acidaemia in children from birth to 3 years.
- POWDER, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 13.1 g, carbohydrate 49.5 g, fat 25 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

**MMA / PA Anamix Infant powder** (Nutricia Ltd) 400 gram (ACBS) - NHS indicative price = £39.45

**MMA/PA Maxamoid®**
- Nutritional supplement for the dietary management of methylmalonic acidaemia or propionic acidaemia.
- POWDER, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 25 g, carbohydrate 5.1 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Maxamoid products are generally intended for use in children 1–8 years.

**MMA/PA Maxamaid powder** (Nutricia Ltd) 500 gram (ACBS) - NHS indicative price = £99.61

**XMTVI Asadon®**
- Nutritional supplement for the dietary management of methylmalonic acidaemia or propionic acidaemia in children and adults.
- POWDER, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g.

**XMTVI Asadon powder** (Nutricia Ltd) 200 gram (ACBS) - NHS indicative price = £75.47

**XMTVI Maxamum®**
- Nutritional supplement for the dietary management of methylmalonic acidaemia or propionic acidaemia in children and adults.
- POWDER, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 39 g, carbohydrate 34 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Maxamum products are generally intended for use in children over 8 years.

**MMA/PA Maxamoid powder** (Nutricia Ltd) 500 gram (ACBS) - NHS indicative price = £159.66

**Other inborn errors of metabolism**

**Cystine500®**
- Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth.
- POWDER, cystine 500 mg, carbohydrate 3.5 g, fat nil, energy 65 kJ (15 kcal)/4 g

**Cystine500 oral powder 4 g sachets** (Vitafo International Ltd) 30 sachet (ACBS) - NHS indicative price = £55.00

**DocOmega®**
- Nutritional supplement for the dietary management of inborn errors of metabolism for adults and children from birth.
- POWDER, (cows’ milk, soya) 100 mg, carbohydrate 5.2 g, fat 500 mg (of which docosahexaenoic acid 200 mg), fibre nil, energy 74 kJ (18 kcal)/4 g, with minerals

**DocOmega oral powder 4g sachets** (Vitafo International Ltd) 30 sachet (ACBS) - NHS indicative price = £39.80

**EAA® Supplement**
- Nutritional supplement for the dietary management of
disorders of protein metabolism including urea cycle disorders in children over 3 years.

POWDER, protein equivalent (essential amino acids) 5 g, carbohydrate 4 g, fat nil, energy 151 kJ (36 kcal)/12.5 g, with vitamins, minerals, and trace elements.

EAA Supplement oral powder 12.5g sachets (Vitafo International Ltd)
50 sachet (ACBS) - NHS indicative price = £207.51

Isolcine50®
- Nutritional supplement for use in the dietary management of inborn errors of amino acid metabolism in adults and children from birth.
POWDER, isolcine 50 mg, carbohydrate 5.8 g, fat nil, energy 63 kJ (15 kcal)/4 g

Isolcine50 oral powder 4g sachets (Vitafo International Ltd)
30 sachet (ACBS) - NHS indicative price = £55.00

KeyOmega®
- Nutritional supplement for the dietary management of inborn errors of metabolism.
POWDER, protein (cows’ milk, soya) 170 mg, carbohydrate 2.8 g, fat 800 mg (of which arachidonic acid 200 mg, docosahexaenoic acid 100 mg), energy 80 kJ (19 kcal)/4 g

KeyOmega oral powder 4g sachets (Vitafo International Ltd)
30 sachet (ACBS) - NHS indicative price = £40.70

Leucine100®
- Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth.
POWDER, leucine 100 mg, carbohydrate 5.7 g, fat nil, energy 65 kJ (15 kcal)/4 g

Leucine100 oral powder sachets (Vitafo International Ltd)
30 sachet (ACBS) - NHS indicative price = £55.00

Low protein drink
- Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children over 1 year.
POWDER, protein (cows’ milk) 4.5 g (phenylalanine 100 mg), carbohydrate 59.5 g, fat 29.9 g, fibre nil, energy 2194 kJ (528 kcal)/100 g, with vitamins, minerals, and trace elements. Contains lactose. Termed Milupa® lp-drink by manufacturer.

Milupa LP drink (Nutricia Ltd)
400 gram (ACBS) - NHS indicative price = £9.36

Phenylalanine50®
- Nutritional supplement for use in the dietary management of inborn errors of metabolism in adults and children from birth.
POWDER, phenylalanine 50 mg, carbohydrate 3.8 g, fat nil, energy 63 kJ (15 kcal)/4 g

Phenylalanine50 oral powder sachets (Vitafo International Ltd)
30 sachet (ACBS) - NHS indicative price = £53.40

ProZero®
- A protein-free nutritional supplement for the dietary management of inborn errors of metabolism in children over 6 months and adults.
LIQUID, carbohydrate 8.1 g (of which sugars 3.5 g), fat 3.8 g, energy 278 kJ (66 kcal)/100 mL. Contains lactose.

ProZero liquid (Vitafo International Ltd)
250 ml (ACBS) - NHS indicative price = £1.46 | 1000 ml (ACBS) - NHS indicative price = £5.86

Tyrosine500®
- Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth.
POWDER, tyrosine 1 g, carbohydrate 2.9 g, fat nil, energy 63 kJ (15 kcal)/4 g sachet.

Tyrosine500 oral powder 4g sachets (Vitafo International Ltd)
30 sachet (ACBS) - NHS indicative price = £5.04

Valine50®
- Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth.
POWDER, valine 50 mg, carbohydrate 3.8 g, fat nil, energy 63 kJ (15 kcal)/4 g

Valine50 oral powder 4g sachets (Vitafo International Ltd)
30 sachet (ACBS) - NHS indicative price = £55.00

Phenylketonuria
Add-ins®
- Nutritional supplement for the dietary management of proven phenylketonuria in children over 4 years.
POWDER, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate nil, fat 5.1 g, energy 359 kJ (86 kcal)/18.2-g sachet, with vitamins, minerals, and trace elements.

Add ins oral powder 18.2g sachets (Nutricia Ltd)
60 sachet (ACBS) - NHS indicative price = £381.00

Easiphen®
- Nutritional supplement for the dietary management of proven phenylketonuria in children over 8 years.
LIQUID, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 6.7 g, carbohydrate 5.1 g, fat 2 g, energy 275 kJ (65 kcal)/100 mL with vitamins, minerals, and trace elements.

Easiphen liquid (Nutricia Ltd)
250 ml (ACBS) - NHS indicative price = £9.79

L-Tyrosine
- Nutritional supplement for the dietary management of phenylketonuria in pregnant women with low plasma tyrosine concentrations.
POWDER, L-tyrosine 20 g, carbohydrate 76.8 g, fat nil, energy 1612 kJ (379 kcal)/100 g

L-Tyrosine powder (Nutricia Ltd)
100 gram (ACBS) - NHS indicative price = £22.22

Lophlex®
- Nutritional supplement for the dietary management of proven phenylketonuria in children over 8 years and adults including pregnant women.
POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 2.5 g, fat 60 mg, fibre 220 mg, energy 585 kJ (91 kcal)/27.8-g sachet, with vitamins, minerals, and trace elements.

Lophlex powder 27.8g sachets berry (Nutricia Ltd)
30 sachet (ACBS) - NHS indicative price = £294.00

LIQUID, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 15 g, carbohydrate 7 g, fat 500 mg, energy 393 kJ (92 kcal)/130 mL, with vitamins, minerals, and trace elements.

TYR orange cooler 15 liquid (Vitafl International Ltd)
130 mL (ACBS) · NHS indicative price = £11.42

TYR red cooler 10 liquid (Vitafl International Ltd)
87 mL (ACBS) · NHS indicative price = £7.32

TYR red cooler 15 liquid (Vitafl International Ltd)
130 mL (ACBS) · NHS indicative price = £11.42

TYR red cooler 20 liquid (Vitafl International Ltd)
174 mL (ACBS) · NHS indicative price = £15.29

TYR express®
- Nutritional supplement for the dietary management of tyrosinaemia in children over 8 years and adults. POWDER, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 15 g, carbohydrate 3.4 g, fat less than 100 mg, energy 1386 kJ (326 kcal)/100 g, with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1003.

TYR express 15 oral powder 25g sachets (Vitafl International Ltd)
30 sachet (ACBS) · NHS indicative price = £336.16

TYR express20
- Nutritional supplement for the dietary management of tyrosinaemia in children over 8 years. POWDER, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 20 g, carbohydrate 4.7 g, fat less than 100 mg, energy 416 kJ (99 kcal)/34 g, with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1003.

TYR express 20 oral powder 34g sachets (Vitafl International Ltd)
30 sachet (ACBS) · NHS indicative price = £434.31

TYR Gel®
- Nutritional supplement for the dietary management of tyrosinaemia in children 1–10 years. GEL, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 10 g, carbohydrate 10.3 g, fat less than 100 mg, energy 339 kJ (81 kcal)/24 g, with vitamins, minerals and trace elements. To flavour unflavoured products, see FlavourPac p. 1003.

TYR gel oral powder 24g sachets (Vitafl International Ltd)
30 sachet (ACBS) · NHS indicative price = £216.42

TYR Lophlex® LQ 20
- Nutritional supplement for the dietary management of tyrosinaemia in children over 3 years and adults. LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 20 g, carbohydrate 8.8 g, fat less than 500 mg, fibre 500 mg, energy 509 kJ (120 kcal)/125 mL, with vitamins, minerals, and trace elements.

TYR Lophlex LQ 20 liquid (Nutricia Ltd)
125 mL (ACBS) · NHS indicative price = £16.27

XPHEN TYR Maxamaid®
- Nutritional supplement for the dietary management of tyrosinaemia in children 1–8 years.
Appendix 3
Cautionary and advisory labels for dispensed medicines

Guidance for cautionary and advisory labels

Medicinal forms within BNF publications include code numbers of the cautionary labels that pharmacists are recommended to add when dispensing. It is also expected that pharmacists will counsel patients and carers when necessary.

Counselling needs to be related to the age, experience, background, and understanding of the individual patient or carer. The pharmacist should ensure understanding of how to take or use the medicine and how to follow the correct dosage schedule. Any effects of the medicine on co-ordination, performance of skilled tasks (e.g. driving or work), any foods or medicines to be avoided, and what to do if a dose is missed should also be explained. Other matters, such as the possibility of staining of the clothes or skin, or discoloration of urine or stools by a medicine should also be mentioned.

For some medicines there is a special need for counselling, such as an unusual method or time of administration or a potential interaction with a common food or domestic remedy, and this should be mentioned where necessary.

Original packs

Most preparations are dispensed in unbroken original packs that include further advice for the patient in the form of patient information leaflets. The advice in patient information leaflets may be less appropriate when the medicine is for a child, particularly for unlicensed medicines or indications. Pharmacists should explain discrepancies to carers, if necessary. The patient information leaflet should only be withheld in exceptional circumstances because it contains other information that should be provided. Label 10 may be of value where appropriate. More general leaflets advising on the administration of preparations such as eye drops, eye ointments, inhalers, and suppositories are also available.

Scope of labels

In general no label recommendations have been made for injections on the assumption that they will be administered by a healthcare professional or a well-instructed patient. The labelling is not exhaustive and pharmacists are recommended to use their professional discretion in labelling new preparations and those for which no labels are shown.

Individual labelling advice is not given on the administration of the large variety of antacids. In the absence of instructions from the prescriber, and if on enquiry the patient has had no verbal instructions, the directions given under ‘Dose’ should be used on the label. It is recognised that there may be occasions when pharmacists will use their knowledge and professional discretion and decide to omit one or more of the recommended labels for a particular patient. In this case counselling is of the utmost importance. There may also be an occasion when a prescriber does not wish additional cautionary labels to be used, in which case the prescription should be endorsed ‘NCL’ (no cautionary labels). The exact wording that is required instead should then be specified on the prescription.

Pharmacists label medicines with various wordings in addition to those directions specified on the prescription. Such labels include ‘Shake the bottle’, ‘For external use only’, and ‘Store in a cool place’, as well as ‘Discard... days after opening’ and ‘Do not use after...’, which apply particularly to antibiotic mixtures, diluted liquid and topical preparations, and to eye-drops. Although not listed in the BNF for Children these labels should continue to be used when appropriate; indeed, ‘For external use only’ is a legal requirement on external liquid preparations, while ‘Keep out of the reach of children’ is a legal requirement on all dispensed medicines. Care should be taken not to obscure other relevant information with adhesive labelling.

It is the usual practice for patients to take standard tablets with water or other liquid and for this reason no separate label has been recommended.

The label wordings recommended by the BNF for Children apply to medicines dispensed against a prescription. Children and carers should be aware that a dispensed medicine should never be taken by, or shared with, anyone other than for whom the prescriber intended it. Therefore, the BNF for Children does not include warnings against the use of a dispensed medicine by persons other than for whom it was specifically prescribed.

The label or labels for each preparation are recommended after careful consideration of the information available. However, it is recognised that in some cases this information may be either incomplete or open to a different interpretation. The BNF for Children will therefore be grateful to receive any constructive comments on the labelling suggested for any preparation.

Recommended label wordings

For BNF for Children 2011–2012, a revised set of cautionary and advisory labels were introduced. All of the existing labels were user-tested, and the revised wording selected reflects terminology that is better understood by patients.

Wordings which can be given as separate warnings are labels 1–19, 29–30, and 32. Wordings which can be incorporated in an appropriate position in the directions for dosage or administration are labels 21–28. A label has been omitted for number 20; labels 31 and 35 no longer apply to any medicines in the BNF for Children and have therefore been deleted.

If separate labels are used it is recommended that the wordings be used without modification. If changes are made to suit computer requirements, care should be taken to retain the sense of the original.

Welsh labels

Comprehensive Welsh translations are available for each cautionary and advisory label. These appear directly under the English label.

Labels

1. Warning: This medicine may make you sleepy

Rhybudd: Gall y feddginiaeth hon eich gwneud yn gysglyd

To be used on preparations for children containing antihistamines, or other preparations given to children where the warnings of label 2 on driving or alcohol would not be appropriate.

2. Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines. Do not drink alcohol

Rhybudd: Gall y feddginiaeth hon eich gwneud yn gysglyd. Peidwch à gyrru, defnyddio offer llaw neu beirianau os yw hyn ym digwydd. Peidwch ag yfed alcohol

To be used on preparations for adults that can cause drowsiness, thereby affecting coordination and the ability to drive and operate hazardous machinery; label 1 is more appropriate for children. It is an offence to drive while under the influence of drink or drugs.

Some of these preparations only cause drowsiness in the
first few days of treatment and some only cause drowsiness in higher doses.

In such cases the patient should be told that the advice applies until the effects have worn off. However many of these preparations can produce a slowing of reaction time and a loss of mental concentration that can have the same effects as drowsiness.

Avoidance of alcoholic drink is recommended because the effects of CNS depressants are enhanced by alcohol. Strict prohibition however could lead to some patients not taking the medicine. Pharmacists should therefore explain the risk and encourage compliance, particularly in patients who may think they already tolerate the effects of alcohol (see also label 3). Queries from patients with epilepsy regarding fitness to drive should be referred back to the patient’s doctor.

Side-effects unrelated to drowsiness that may affect a patient’s ability to drive or operate machinery safely include blurred vision, dizziness, or nausea. In general, no label has been recommended to cover these cases, but the patient should be suitably counselled.

3 Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines

Rhybudd: Gall y feddyginiaeth hon eich gwneud yn gysgyld. Peidiwch â gyrru, defnyddio offer llaw neu beiriannau os yw hyn yn digwydd

To be used on preparations containing monoamine-oxidase inhibitors; the warning to avoid alcohol and dealkoholised (low alcohol) drink is covered by the patient information leaflet.

Also to be used as for label 2 but where alcohol is not an issue.

4 Warning: Do not drink alcohol

Rhybudd: Peidiwch ag yfed alcohol

To be used on preparations where a reaction such as flushing may occur if alcohol is taken (e.g. metronidazole). Alcohol may also enhance the hypoglycaemia produced by some oral antidiabetic drugs but routine application of a warning label is not considered necessary.

Patients should be advised not to drink alcohol for as long as they are receiving/using a course of medication, and in some cases for a period of time after the course is finished.

5 Do not take indigestion remedies 2 hours before or after you take this medicine

Rhybudd: Peidiwch â chymryd meddyginiaeth camdreuliu neu yfeddyginiaeth hon

To be used with label 25 on preparations coated to resist gastric acid (e.g. enteric-coated tablets). This is to avoid the possibility of premature dissolution of the coating in the presence of an alkaline pH.

Label 5 also applies to drugs such as gabapentin where the absorption is significantly affected by antacids. Pharmacists will be aware (from a knowledge of physiology) that the usual time during which indigestion remedies should be avoided is at least 2 hours before and after the majority of medicines have been taken; when a manufacturer advises a different time period, this can be followed, and should be explained to the patient.

6 Do not take indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine

Peidiwch â chymryd meddyginiaeth camdreuliu neu feddyginiaeth hon

To be used on preparations containing olofoxacin and some other quinolones, doxycycline, lymecycline, minocycline, and penicillamine. These drugs chelate calcium, iron, and zinc and are less well absorbed when taken with calcium containing antacids or preparations containing iron or zinc. Pharmacists will be aware (from a knowledge of physiology) that these incompatible preparations should be taken at least 2 hours apart for the majority of medicines; when a manufacturer advises a different time period, this can be followed, and should be explained to the patient.

7 Do not take milk, indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine

Rhybudd: Peidiwch â chymryd mlynedd, meddyginiaeth camdreuliu, neu feddyginiaeth sy’n cynnwys haearn neu sic, 2 awr cyn neu ar ôl cymryd y feddyginiaeth hon

To be used on preparations containing ciprofloxacin, norfloxacin, or tetracyclines that chelate calcium, iron, magnesium, and zinc, and are thus less available for absorption. Pharmacists will be aware (from a knowledge of physiology) that these incompatible preparations should be taken at least 2 hours apart for the majority of medicines; when a manufacturer advises a different time period, this can be followed, and should be explained to the patient. Doxycycline, lymecycline, and minocycline are less liable to form chelates and therefore only require label 6 (see above).

8 Warning: Do not stop taking this medicine unless your doctor tells you to stop

Rhybudd: Peidiwch â stopio cymryd y feddyginiaeth hon, oni bai fod eich meddyg yn dweud wrthych am stopio

To be used on preparations that contain a drug which is required to be taken over long periods without the patient necessarily receiving any benefit (e.g. antituberculous drugs). Also to be used on preparations that contain a drug whose withdrawal is likely to be a particular hazard (e.g. clonidine for hypertension). Label 10 (see below) is more appropriate for corticosteroids.

9 Space the doses evenly throughout the day. Keep taking this medicine until the course is finished, unless you are told to stop

Rhybudd: Peidiwch â cymryd y feddyginiaeth hon, oni bai eich meddyg yn dweud wrthych am stopio

To be used on preparations where a course of treatment should be completed to reduce the incidence of relapse or failure of treatment.

The preparations are antimicrobial drugs given by mouth. Very occasionally, some may have severe side-effects (e.g. diarrhoea in patients receiving clindamycin) and in such cases the patient may need to be advised of reasons for stopping treatment quickly and returning to the doctor.

10 Warning: Read the additional information given with this medicine

Rhybudd: Darllenwch y wybodaeth ychwanegol gyda’r feddyginiaeth hon

To be used particularly on preparations containing anticoagulants, lithium, and oral corticosteroids. The appropriate treatment card should be given to the patient and any necessary explanations given.

This label may also be used on other preparations to remind the patient of the instructions that have been given.

11 Protect your skin from sunlight—even on a bright but cloudy day. Do not use sunbeds

Diogelwch eich croen rhag golau—hyd yn oed ar ddiwrnod hafent, hyd yn oed rhag ymchwil yfedwyn

To be used on preparations that may cause phototoxic or photoallergic reactions if the patient is exposed to ultraviolet radiation. Many drugs other than those listed in Appendix 3 (e.g. phenothiazines and sulphonamides) may, on rare occasions, cause reactions in susceptible patients. Exposure to high intensity ultraviolet radiation from sunray lamps and sunbeds is particularly likely to cause reactions.

12 Do not take anything containing aspirin while taking this medicine

Rhybudd: Peidiwch â cymryd unrhyw beth sy’n cynnwys aspirin gyda’r feddyginiaeth hon

To be used on preparations containing sulfinpyrazone whose activity is reduced by aspirin.

Label 12 should not be used for anticoagulants since label 10 is more appropriate.
13 Dissolve or mix with water before taking
Gadwch i doddi mewn dŵr cyn ei gymryd
To be used on preparations that are intended to be dissolved in water (e.g. soluble tablets) or mixed with water (e.g. powders, granules) before use. In a few cases other liquids such as fruit juice or milk may be used.

14 This medicine may colour your urine. This is harmless
Gall y feddyginaeth hon liwio eich dŵr. Nid wy hyn yn arwydd o ddrwg
To be used on preparations that may cause the patient’s urine to turn an unusual colour. These include triamterene (blue under some lights), levodopa (dark reddish), and rifampicin (red).

15 Caution: flammable. Keep your body away from fire or flames
Rhybudd: Fflamadwy. Ar ôl rhoi'r feddyginaeth ymlaen, cadwch yn glir o dân neu ffliamau
To be used on preparations containing sufficient flammable solvent to render them flammable if exposed to a naked flame.

16 Dissolve the tablet under your tongue—do not swallow. Store the tablets in this bottle with the cap tightly closed. Get a new supply 8 weeks after opening
Rhowch y dabledd i doddi dan eich tafod - peidiwch â gyrru, ar ôl rhoi'r feddyginaeth ymlaen, gadwch i doddi mewn dw
To be used on preparations that are intended to be dissolved in water (e.g. powders, granules) before use. In a few cases other liquids such as fruit juice or milk may be used.

17 Do not take more than... in 24 hours
Peidiwch â chymryd mwy na... mewn 24 awr
To be used on preparations for the treatment of acute migraine except those containing ergotamine, for which label 18 is used. The dose form should be specified, e.g. tablets or capsules.

18 Do not take more than... in any one week
Peidiwch â chymryd mwy na... mewn 24 awr. Hefyd, peidiwch â chymryd mwy na... mewn wythnos
To be used on preparations containing ergotamine. The dose form should be specified, e.g. tablets or suppositories.

19 Warning: This medicine makes you sleepy. If you still feel sleepy the next day, do not drive or use tools or machines. Do not drink alcohol
Rhybudd: Bydd y feddyginaeth hon yn eich gwneud yn gysglyd. Os ydych yn dal i deimlo yn gysglyd, peidiwch â chymryd mwy na... mewn wythnos
To be used on preparations containing hypnotics (or some other drugs with sedative effects) prescribed to be taken at night. On the rare occasions when hypnotics are prescribed for daytime administration (e.g. nitrazepam in epilepsy), this label would clearly not be appropriate. Also to be used as an alternative to the label 2 wording (the choice being at the discretion of the pharmacist) for anxiolytics prescribed to be taken at night.

20 Take with or just after food, or a meal
Cymerwch gyda neu ar ôl bwyd
To be used on preparations that are liable to cause gastric irritation, or those that are better absorbed with food.

21 Take with or just after food, or a meal
Cymerwch gyda neu ar ôl bwyd
To be used on preparations that are liable to cause gastric irritation, or those that are better absorbed with food.

22 Take 30 to 60 minutes before food
Cymerwch 30 i 60 munud cyn bwyd
To be used on some preparations whose absorption is thereby improved.

Most oral antibacterials require label 23 instead (see below).

23 Take this medicine when your stomach is empty. This means an hour before food or 2 hours after food
Cymerwch y feddyginaeth hon ar stumog wag. Mae hyd yn golygu awr cyn, neu 2 awr ar Ôl bwyd
To be used on oral antibacterials whose absorption may be reduced by the presence of food and acid in the stomach.

24 Suck or chew this medicine
Bydd angen cni neu sugno'r feddyginaeth hon
To be used on preparations that should be sucked or chewed.

25 Swallow this medicine whole. Do not chew or crush
Llynchw yn gyfan. Peidiwch â chni neu fahôn fân
To be used on preparations that are enteric-coated or designed for modified-release.

26 Dissolve this medicine under your tongue
Gadwch i doddi mewn dw
To be used on preparations designed for sublingual use.

27 Take with a full glass of water
Cymerwch gyda llenyd gyddy'r dŵr
To be used on preparations that should be well diluted (e.g. chloral hydrate), where a high fluid intake is required (e.g. sulfonamides), or where water is required to aid the action (e.g. methylcellulose). The patient should be advised that a 'full glass' means at least 150 mL. In most cases fruit juice, tea, or coffee may be used.

28 Spread thinly on the affected skin only
Taenwch yn denau ar y croen sydd wedi'i cae
To be used on external preparations designed for topical use. Patients should be advised to hold under the tongue and avoid swallowing until dissolved. The buccal mucosa between the gum and cheek is occasionally specified by the prescriber.

29 Do not take more than 2 at any one time. Do not take more than 8 in 24 hours
Peidiwch â chymryd mwy na 2 ar unrhyw un adeg. Peidiwch â chymryd mwy na 8 mewn 24 awr
To be used on containers of dispensed solid dose preparations containing paracetamol for adults where the instruction on the label indicates that the dose can be taken on an 'as required' basis. The dose form should be specified, e.g. tablets or capsules.

30 Contains paracetamol. Do not take anything else containing paracetamol while taking this medicine. Talk to a doctor at once if you take too much of this medicine, even if you feel well
Yn cynnwys paracetamol. Peidiwch â chymryd unrhyw beth arall sy'n cynnwys paracetamol tra'n cymryd y feddyginaeth hon. Siaradwch gyda'r meddyg ar unwaith os ydych yn cymryd gormod, hyd yn oed os ydych yn teimlo'n iawn
To be used on all containers of dispensed preparations containing paracetamol.

31 Contains aspirin. Do not take anything else containing aspirin while taking this medicine
Yn cynnwys aspirin. Peidiwch â chymryd unrhyw beth arall sy'n cynnwys aspirin tra'n cymryd y feddyginaeth hon.

To be used on containers of dispensed preparations containing aspirin when the name on the label does not include the word 'aspirin'.

1018 Cautionary and advisory labels for dispensed medicines
BNFC 2017–2018
Dental Practitioners’ Formulary

List of Dental Preparations

The following list has been approved by the appropriate Secretaries of State, and the preparations therein may be prescribed by dental practitioners on form FP10D (GP14 in Scotland, WP10D in Wales).

Licensed sugar-free versions, where available, are preferred. Licensed alcohol-free mouthwashes, where available, are preferred.

Aciclovir Cream, BP
Aciclovir Oral Suspension, BP, 200 mg/5 mL
Aciclovir Tablets, BP, 200 mg
Aciclovir Tablets, BP, 800 mg
Amoxicillin Capsules, BP
Amoxicillin Oral Powder, DPF
Amoxicillin Oral Suspension, BP
Artificial Saliva Gel, DPF
Artificial Saliva Oral Spray, DPF
Artificial Saliva Pastilles, DPF
Artificial Saliva Protective Spray, DPF
Artificial Saliva Substitutes as listed below (to be prescribed only for indications approved by ACBS (patients suffering from dry mouth as a result of having or, having undergone, radiotherapy or sicca syndrome):
BioXtra® Gel Mouthspray
BioXtra® Moisturising Gel
Glandosane®
Saliveze®
Artificial Saliva Substitute Spray, DPF
Aspirin Tablets, Dispersible, BP
Azithromycin Capsules, 250 mg, DPF
Azithromycin Oral Suspension, 200 mg/5 mL, DPF
Azithromycin Tablets, 250 mg, DPF
Azithromycin Tablets, 500 mg, DPF
Beclometasone Pressurised Inhalation, BP,
50 micrograms/ metered inhalation, CFC-free, as: Clenil Modulite®
Benzylamine Mouthwash, BP 0.15%
Benzylamine Oromucosal Spray, BP 0.15%
Betamethasone Soluble Tablets, 500 micrograms, DPF
Carbamazepine Tablets, BP
Cefalexin Capsules, BP
Cefalexin Oral Suspension, BP
Cefalexin Tablets, BP
Cefradine Capsules, BP
Cetirizine Oral Solution, BP, 5 mg/5 mL
Cetirizine Tablets, BP, 10 mg
Chlorhexidine Gluconate Gel, BP
Chlorhexidine Mouthwash, BP
Chlorhexidine Oral Spray, DPF
Chlorphenamine Oral Solution, BP
Chlorphenamine Tablets, BP
Chlorphenamine Tablets, BP
Clarithromycin Oral Suspension, 125 mg/5 mL, DPF
Clarithromycin Oral Suspension, 250 mg/5 mL, DPF
Clarithromycin Tablets, BP
Clindamycin Capsules, BP
Co-amoxiclav Tablets, BP, 250/125 (amoxicillin 250 mg as trihydrate, clavulanic acid 125 mg as potassium salt)
Co-amoxiclav Oral Suspension, BP, 125/31 (amoxicillin 125 mg as trihydrate, clavulanic acid 31.25 mg as potassium salt)/5 mL
Co-amoxiclav Oral Suspension, BP, 250/62 (amoxicillin 250 mg as trihydrate, clavulanic acid 62.5 mg as potassium salt)/5 mL
Diazepam Tablets, BP
Diazepam Oral Solution, BP, 2 mg/5 mL
Diclofenac Sodium Tablets, Gastro-resistant, BP
Dihydrocodeine Tablets, BP, 30 mg
Doxycycline Tablets, Dispersible, BP
Doxycycline Capsules, BP, 100 mg
Doxycycline Tablets, 20 mg, DPF
Epidural Analgesic, BP
Erythromycin Ethyl Succinate Oral Suspension, BP
Erythromycin Ethyl Succinate Tablets, BP
Erythromycin Stearate Tablets, BP
Fluconazole Capsules, 50 mg, DPF
Fluconazole Oral Suspension, 50 mg/5 mL, DPF
Hydrocortisone Cream, BP, 1%
Hydrocortisone Oromucosal Tablets, BP
Hydrogen Peroxide Mouthwash, BP, 6%
Ibuprofen Oral Suspension, BP, sugar-free
Ibuprofen Tablets, BP
Lansoprazole Capsules, Gastro-resistant, BP
Lidocaine Ointment, BP, 5%
Lidocaine Spray 10%, DPF
Loratadine, 5 mg/5 mL, DPF
Loratadine Tablets, BP, 10 mg
Menthol and Eucalyptus Inhalation, BP 1980
Metronidazole Oral Suspension, BP
Metronidazole Tablets, BP
Miconazole Cream, BP
Miconazole Oromucosal Gel, BP
Miconazole and Hydrocortisone Cream, BP
Miconazole and Hydrocortisone Ointment, BP
Nystatin Oral Suspension, BP
Omeprazole Capsules, Gastro-resistant, BP
Oxytetracycline Tablets, BP
Paracetamol Oral Suspension, BP
Paracetamol Tablets, BP
Paracetamol Tablets, Soluble, BP
Phenoxybenzylpenicillin Oral Solution, BP
Phenoxybenzylpenicillin Tablets, BP
Promethazine Hydrochloride Tablets, BP
Promethazine Oral Solution, BP
Saliva Stimulating Tablets, DPF
Sodium Chloride Mouthwash, Compound, BP
Sodium Fluoride Mouthwash, BP
Sodium Fluoride Oral Drops, BP
Sodium Fluoride Tablets, BP
Sodium Fluoride Toothpaste 0.619%, DPF
Sodium Fluoride Toothpaste 1.1%, DPF
Sodium Fusidate Ointment, BP
Temazepam Oral Solution, BP
Temazepam Tablets, BP
Tetracycline Tablets, BP
Nurse Prescribers’ Formulary

Nurse Prescribers’ Formulary for Community Practitioners

List of preparations approved by the Secretary of State which may be prescribed on form FP10P (form HS21(N) in Northern Ireland, form GP10(N) in Scotland, forms WP10CN and WP10PN in Wales) by Nurses for National Health Service patients.

Community practitioners who have completed the necessary training may only prescribe items appearing in the nurse prescribers’ list set out below. Community Practitioner Nurse Prescribers are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved generic name.

Medicinal Preparations

Preparations on this list which are not included in the BP or BPC are described under Details of NPF preparations (p. 1021).

Almond Oil Enema, BP
Arachis Oil Enema, NPF
Aspirin Tablets, Dispersible, 300 mg, BP (max. 96 tablets; max. pack size 32 tablets)
Bisacodyl Suppositories, BP (includes 5-mg and 10-mg strengths)
Bisacodyl Tablets, BP
Catheter Maintenance Solution, Sodium Chloride, NPF
Catheter Maintenance Solution, ‘Solution G’, NPF
Catheter Maintenance Solution, ‘Solution R’, NPF
Chlorhexidine Gluconate Alcoholic Solutions containing at least 0.05%
Chlorhexidine Gluconate Aqueous Solutions containing at least 0.05%
Choline Salicylate Dental Gel, BP
Clotrizamole Cream 1%, BP
Co-danthramer Capsules, NPF
Co-danthramer Capsules, Strong, NPF
Co-danthramer Oral Suspension, NPF
Co-danthramer Oral Suspension, Strong, NPF
Co-danthrusate Capsules, BP
Co-danthrusate Oral Suspension, NPF
Crotamiton Cream, BP
Crotamiton Lotion, BP
Dimeticonic barrier creams containing at least 10%
Dimeticone Lotion, NPF
Docusate Capsules, BP
Docusate Enema, NPF
Docusate Oral Solution, BP
Docusate Oral Solution, Paediatric, BP
Econazole Cream 1%, BP
Emollients as listed below:
  - Aquadrate® 10% w/w Cream
  - Arachis Oil, BP
  - Balneum® Plus Cream
  - Cetraben® Emollient Cream
  - Dermamist®
  - Diprobase® Cream
  - Diprobase® Ointment
  - Doublebase®
  - Doublebase® Dayleve Gel
  - E45® Cream
  - E45® Itch Relief Cream
  - Emulsifying Ointment, BP
  - Eucerin® Intensive 10% w/w Urea Treatment Cream
  - Eucerin® Intensive 10% w/w Urea Treatment Lotion
  - Hydromol® Cream
  - Hydromol® Intensive
  - Hydrous Ointment, BP
  - Lipobase®
  - Liquid and White Soft Paraffin Ointment, NPF
  - Neutrogena® Norwegian Formula Dermatological Cream
  - Nutraplus® Cream
  - Oilatum® Cream
  - Oilatum® Junior Cream
  - Paraffin, White Soft, BP
  - Paraffin, Yellow Soft, BP
  - Ultrabase®
  - Unguentum M®
  - Emollient Bath and Shower Preparations as listed below: Aqueous Cream, BP
Balneum® (except pack sizes that are not to be prescribed under the NHS (see Part XVIIA of the Drug Tariff, Part XI of the Northern Ireland Drug Tariff))
Balneum Plus® Bath Oil (except pack sizes that are not to be prescribed under the NHS (see Part XVIIA of the Drug Tariff, Part XI of the Northern Ireland Drug Tariff))
Cetraben® Emollient Bath Additive
Dermalo® Bath Emollient
Doublebase® Emollient Bath Additive
Doublebase® Emollient Shower Gel
Doublebase® Emollient Wash Gel
Hydromol® Bath and Shower Emollient
Oilatum® Emollient
Oilatum® Gel
Oilatum® Junior Bath Additive
Zerolatum® Emollient Medicinal Bath Oil
Folic Acid Tablets 400 micrograms, BP
Glycerol Suppositories, BP
Ibufrofen Oral Suspension, BP (except for indications and doses that are prescription-only)
Ibufrofen Tablets, BP (except for indications and doses that are prescription-only)
Ispaghula Husk Granules, BP
Ispaghula Husk Granules, Effervescent, BP
Ispaghula Husk Oral Powder, BP
Lactulose Solution, BP
Lidocaine Ointment, BP
Lidocaine and Chlorhexidine Gel, BP
Macrogol Oral Liquid, Compound, NPF
Macrogol Oral Powder, Compound, NPF
Macrogol Oral Powder, Compound, Half-strength, NPF
Magnesium Hydroxide Mixture, BP
Magnesium Sulfate Paste, BP
Malathion aqueous lotions containing at least 0.5%
Mebendazole Oral Suspension, NPF
Mebendazole Tablets, NPF
Methylcellulose Tablets, BP
Miconazole Cream 2%, BP
Miconazole Oromucosal Gel, BP
Mouthwash Solution-tablets, NPF
Nicotine Inhalation Cartridge for Oromucosal Use, NPF
Nicotine Lozenge, NPF
Nicotine Medicated Chewing Gum, NPF
Nicotine Nasal Spray, NPF
Nicotine Oral Spray, NPF
Nicotine Sublingual Tablets, NPF
Nicotine Transdermal Patches, NPF
Nystatin Oral Suspension, BP
Olive Oil Enal Drops, BP
Paracetamol Oral Suspension, BP (includes 120 mg/5 mL and 250 mg/5 mL strengths—both of which are available as sugar-free formulations)
Paracetamol Tablets, BP (max. 96 tablets; max. pack size 32 tablets)
Paracetamol Tablets, Soluble, BP (includes 120-mg and 500-mg tablets; max. 96 tablets; max. pack size 32 tablets)
Permethrin Cream, NPF
Phosphates Enema, BP
Povidone—Iodine Solution, BP
Senna Oral Solution, NPF
Senna Tablets, BP
Senna and Ispaghula Granules, NPF
Sodium Chloride Solution, Sterile, BP
Sodium Citrate Compound Enema, NPF
Sodium Picosulfate Capsules, NPF
Sodium Picosulfate Elixir, NPF
Spernicidal contraceptives as listed below:
Gygel® Contraceptive Jelly
Sterculia Granules, NPF
Sterculia and Frangula Granules, NPF
Titanium Ointment, BP
Water for Injections, BP
Zinc and Castor Oil Ointment, BP
Zinc Oxide and Dimeticone Spray, NPF
Zinc Oxide Impregnated Medicated Bandage, NPF
Zinc Oxide Impregnated Medicated Stocking, NPF
Zinc Paste Bandage, BP 1993
Zinc Paste and Ichthammol Bandage, BP 1993

**Appliances and Reagents (including Wound Management Products)**

Community Practitioner Nurse Prescribers in England, Wales and Northern Ireland can prescribe any appliance or reagent in the relevant Drug Tariff. In the Scottish Drug Tariff, Appliances and Reagents which may not be prescribed by Nurses are annotated Nx.

**Appliances** (including Contraceptive Devices) as listed in Part IXA of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 3 (Appliances) and Part 2 (Dressings) of the Scottish Drug Tariff). (Where it is not appropriate for nurse prescribers in family planning clinics to prescribe contraceptive devices using form FP10(P) (forms WP10CN and WP10PN in Wales), they may prescribe using the same system as doctors in the clinic.)

**Incontinence Appliances** as listed in Part IXB of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 5 of the Scottish Drug Tariff).

**Stoma Appliances and Associated Products** as listed in Part IXC of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 6 of the Scottish Drug Tariff).

**Chemical Reagents** as listed in Part IXR of the Drug Tariff (Part II of the Northern Ireland Drug Tariff, Part 9 of the Scottish Drug Tariff).

The Drug Tariffs can be accessed online at: National Health Service Drug Tariff for England and Wales: [www.ppa.org.uk/ppa/edt_intro.htm](http://www.ppa.org.uk/ppa/edt_intro.htm)
Health and Personal Social Services for Northern Ireland Drug Tariff: [www.hscbusiness.hscni.net/services/2034.htm](http://www.hscbusiness.hscni.net/services/2034.htm)

**Details of NPF preparations**

Preparations on the Nurse Prescribers’ Formulary which are not included in the BP or BPC are described as follows in the Nurse Prescribers’ Formulary. Although brand names have sometimes been included for identification purposes, it is recommended that non-proprietary names should be used for prescribing medicinal preparations in the NPF except where a non-proprietary name is not available.

**Arachis Oil Enema**
arachis oil 100%

**Catheter Maintenance Solution, Sodium Chloride**
(proprietary products: OptiFlo S; Uro-Tainer Sodium Chloride; Unisept), sodium chloride 0.9%

**Catheter Maintenance Solution, ‘Solution G’**
(proprietary products: OptiFlo G; Uro-Tainer Suby G; Unisept G), citric acid 3.23%, magnesium oxide 0.38%, sodium bicarbonate 0.7%, disodium edetate 0.01%

**Catheter Maintenance Solution, ‘Solution R’**
(proprietary products: OptiFlo R; Uro-Tainer Solution R; Unisept R), citric acid 6%, gluconolactone 0.6%, magnesium carbonate 2.8%, disodium edetate 0.01%

**Chlorhexidine Gluconate Alcoholic Solutions**
(proprietary products: Chloraprep; Hydrex Solution; Hydrex spray), chlorhexidine gluconate in alcoholic solution

**Chlorhexidine Gluconate Aqueous Solutions**
(proprietary product: Unisept), chlorhexidine gluconate in aqueous solution

**Co-danthramer Capsules**
co-danthramer 25/200 (dantron 25 mg, poloxamer ‘188’ 200 mg)

**Co-danthramer Capsules, Strong**
co-danthramer 37.5/500 (dantron 37.5 mg, poloxamer ‘188’ 500 mg)

**Co-danthramer Oral Suspension**
(proprietary product: Codalax), co-danthramer 25/200 in 5 mL (dantron 25 mg, poloxamer ‘188’ 200 mg/5 mL)

**Co-danthramer Oral Suspension, Strong**
(proprietary product: Codalax Forte), co-danthramer 75/1000 in 5 mL (dantron 75 mg, poloxamer ‘188’ 1 g/5 mL)

**Co-danthrusate Oral Suspension**
(proprietary product: Normax), co-danthrusate 50/60 (dantron 50 mg, docusate sodium 60 mg/5 mL)

**Dimeticone Barrier Creams**
(proprietary products: Conotrane Cream, dimeticone ‘350’ 22%; Stoepl Barrier Cream, dimeticone ‘1000’ 10%), dimeticone 10–22%

**Dimeticone Lotion**
(proprietary product: Hedrin), dimeticone 4%

**Docusate Enema**
(proprietary product: Norgalax Micro-enema), docusate sodium 120 mg in 10 g

**Liquid and White Soft Paraffin Ointment**
liquid paraffin 50%, white soft paraffin 50%

**Macrogol Oral Liquid, Compound**
(proprietary product: Movicol Liquid), macrogol ‘3350’ (polyethylene glycol ‘3350’) 13.125 g, sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 46.6 mg/25 mL

**Macrogol Oral Powder, Compound**
(proprietary products: Laxido Orange, Molaxole, Movicol), macrogol ‘3350’ (polyethylene glycol ‘3350’) 13.125 g, sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 46.6 mg/sachet; (amount of potassium chloride varies according to flavour of Movico® as follows: plain–flavour (sugar-free) = 50.2 mg/sachet; lime and lemon flavour = 46.6 mg/sachet; chocolate flavour = 31.7 mg/sachet. 1 sachet when reconstituted with 125 mL water provides K⁺ 5.4 mmol/litre)

**Macrogol Oral Powder, Compound, Half-strength**
(proprietary product: Movicol-Half), macrogol ‘3350’ (polyethylene glycol ‘3350’) 6.563 g, sodium bicarbonate 89.3 g, sodium chloride 175.4 mg, potassium chloride 23.3 mg/sachet

**Malathion Aqueous Lotions**
(proprietary products: Derbac-M Liquid), malathion 0.5% in an aqueous basis

**Mebendazole Oral Suspension**
(proprietary product: Vermox), mebendazole 100 mg/5 mL
Mebendazole Tablets
(proprietary products: Ovex, Vermox), mebendazole 100 mg (can be supplied for oral use in the treatment of enterobiasis in adults and children over 2 years provided its container or package is labelled to show a max. single dose of 100 mg and it is supplied in a container or package containing not more than 800 mg)

**Mouthwash Solution-tablets**
consist of tablets which may contain antimicrobial, colouring and flavouring agents in a suitable soluble effervescent basis to make a mouthwash

**Nicotine Inhalation Cartridge for Oromucosal Use**
(proprietary products: NicAssist Inhalator, Nicorette Inhalator), nicotine 15 mg (for use with inhalation mouthpiece; to be prescribed as either a starter pack (6 cartridges with inhalator device and holder) or refill pack (42 cartridges with inhalator device)

**Nicotine Lozenge**
nicotine (as bitartrate) 1 mg or 2 mg (proprietary product: Nicorette Mint Lozenge, Nicotinell Mint Lozenge), or nicotine (as resinate) 1.5 mg, 2 mg, or 4 mg (proprietary product: NiQuitin Lozenges, NiQuitin Minis, NiQuitin Pre-quit)

**Nicotine Medicated Chewing Gum**
(proprietary products: NicAssist Gum, Nicorette Gum, Nicotinell Gum, NiQuitin Gum), nicotine 2 mg or 4 mg

**Nicotine Nasal Spray**
(proprietary product: NicAssist Nasal Spray, Nicorette Nasal Spray), nicotine 500 micrograms/metered spray

**Nicotine Oral Spray**
(proprietary product: Nicorette Quickmist), nicotine 1 mg/metered spray

**Nicotine Sublingual Tablets**
(proprietary product: NicAssist Microtab, Nicorette Microtab), nicotine (as a cyclodextrin complex) 2 mg (to be prescribed as either a starter pack (2 × 15-tablet discs with dispenser) or refill pack (7 × 15-tablet discs))

**Nicotine Transdermal Patches**
releasing in each 16 hours, nicotine approx. 5 mg, 10 mg, or 15 mg (proprietary products: Boots NicAssist Patch, Nicorette Patch), or releasing in each 16 hours approx. 10 mg, 15 mg, or 25 mg (proprietary products: NicAssist Translucent Patch, Nicorette Invisi Patch), or releasing in each 24 hours nicotine approx. 7 mg, 14 mg, or 21 mg (proprietary products: Nicopatch, Nicotinell TTS, NiQuitin, NiQuitin Clear) (prescriber should specify the brand to be dispensed)

**Permethrin Cream**
(proprietary product: Lyclear Dermal Cream), permethrin 5%

**Senna Oral Solution**
(proprietary product: Senokot Syrup), sennosides 7.5 mg/5 mL

**Senna and Ispaghula Granules**
(proprietary product: Manevac Granules), senna fruit 12.4%, ispaghula 54.2%

**Sodium Citrate Compound Enema**
(proprietary products: Micolette Micro-enema; Micralax Micro-enema; Relaxit Micro-enema), sodium citrate 450 mg with glycerol, sorbitol and an anionic surfactant

**Sodium Picosulfate Capsules**
(proprietary products: Dulcolax Perles), sodium picosulfate 2.5 mg

**Sodium Picosulfate Elixir**
(proprietary product: Dulcolax Liquid), sodium picosulfate 5 mg/5 mL

**Sterculia Granules**
(proprietary product: Normacol Granules), sterculia 62%

**Sterculia and Frangula Granules**
(proprietary product: Normacol Plus Granules), sterculia 62%, frangula (standardised) 8%

**Zinc Oxide Impregnated Medicated Bandage**
(proprietary product: Steripaste), sterile cotton bandage impregnated with paste containing zinc oxide 15%

**Zinc Oxide Impregnated Medicated Stocking**
(proprietary product: Zipzoc), sterile rayon stocking impregnated with ointment containing zinc oxide 20%
Non-medical prescribing

Overview
A range of non-medical healthcare professionals can prescribe medicines for patients as either Independent or Supplementary Prescribers.

Independent prescribers are practitioners responsible and accountable for the assessment of patients with previously undiagnosed or diagnosed conditions and for decisions about the clinical management required, including prescribing. They are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved non-proprietary name.

Supplementary prescribing is a partnership between an independent prescriber (a doctor or a dentist) and a supplementary prescriber to implement an agreed Clinical Management Plan for an individual patient with that patient’s agreement.

Independent and Supplementary Prescribers are identified by an annotation next to their name in the relevant professional register.

Information and guidance on non-medical prescribing is available on the Department of Health website at www.dh.gov.uk/health/2012/04/prescribing-change.

For information on the supply and administration of medicines to groups of patients using Patient Group Directions see Guidance on prescribing p. 1.

Nurses
Nurse Independent Prescribers (formerly known as Extended Formulary Nurse Prescribers) are able to prescribe any medicine for any medical condition.

Nurse Independent Prescribers are able to prescribe, administer, and give directions for the administration of Schedule 2, 3, 4, and 5 Controlled Drugs. This extends to diamorphine, dipipanone, or cocaine for treating organic disease or injury, but not for treating addiction.

Nurse Independent Prescribers must work within their own level of professional competence and expertise.

Pharmacists
Pharmacist Independent Prescribers can prescribe any medicine for any medical condition.

They are also able to prescribe, administer, and give directions for the administration of Schedule 2, 3, 4, and 5 Controlled Drugs. This extends to diamorphine, dipipanone, or cocaine for treating organic disease or injury, but not for treating addiction.

Pharmacist Independent Prescribers must work within their own level of professional competence and expertise.

Optometrists
Optometrist Independent Prescribers can prescribe any licensed medicine for ocular conditions affecting the eye and the tissues surrounding the eye, except Controlled Drugs or medicines for parenteral administration.
Index of proprietary manufacturers

Alphabetical list of manufacturers and other companies.

The following is an alphabetical list of manufacturers and other companies referenced in the BNF, with their medicines information or general contact details. For information on ‘special-order’ manufacturers and specialist importing companies see ‘Special-order manufacturers’.

Special-order manufacturers

Unlicensed medicines are available from ‘special-order’ manufacturers and specialist-importing companies; the MHRA maintains a register of these companies at tinyurl.com/cdske.

Licensed hospital manufacturing units also manufacture ‘special-order’ products as unlicensed medicines, the principal NHS units are listed below. A database (Pro-File; www.pro-file.nhs.uk) provides information on medicines manufactured in the NHS; access is restricted to NHS pharmacy staff.

The Association of Pharmaceutical Specials Manufacturers may also be able to provide further information about commercial companies (www.apsm-uk.com).

The MHRA recommends that an unlicensed medicine should only be used when a patient has special requirements that cannot be met by use of a licensed medicine.

As well as being available direct from the hospital manufacturer(s) concerned, many NHS-manufactured Specials may be bought from the Oxford Pharmacy Store, owned and operated by Oxford Health NHS Foundation Trust.

</thead>
</table>

Do you consider the reactions to be serious? Yes / No

If yes, please indicate why the reaction is considered to be serious (please tick all that apply):

- [ ] Patient died due to reaction
- [ ] Life threatening
- [ ] Congenital abnormality
- [ ] Involved or prolonged inpatient hospitalisation
- [ ] Involved persistent or significant disability or incapacity
- [ ] Medically significant; please give details: ____________________________

If the reactions were not serious according to the categories above, how bad was the suspected reaction?

- [ ] Mild
- [ ] Unpleasant, but did not affect everyday activities
- [ ] Bad enough to affect everyday activities
It’s easy to report online: www.mhra.gov.uk/yellowcard

OTHER DRUG(S) (including self-medication and complementary remedies)
Did the patient take any other medicines/vaccines/complementary remedies in the last 3 months prior to the reaction? Yes / No
If yes, please give the following information if known:

<table>

Newborn Life Support

(antenatal counselling)
Team briefing and equipment check

Birth

Dry the baby
Maintain normal temperature
Start the clock or note the time

Assess (tone), breathing, heart rate

If gasping or not breathing:
Open the airway
Give 5 inflation breaths
Consider SpO₂ ± ECG monitoring

Re-assess
If no increase in heart rate look for chest movement during inflation

If chest not moving:
Recheck head position
Consider 2-person airway control and other airway manoeuvres
Repeat inflation breaths
SpO₂ ± ECG monitoring
Look for a response

If no increase in heart rate look for chest movement

When the chest is moving:
If heart rate is not detectable or very slow (< 60 min⁻¹) start chest compressions; coordinate with ventilation breaths (ratio 3:1)

Re-assess heart rate every 30 seconds:
If heart rate is not detectable or very slow (< 60 min⁻¹) consider vascular access and drugs

Update parents and debrief team

Acceptable pre-ductal SpO₂
- 2 min 60%
- 3 min 70%
- 4 min 80%
- 5 min 85%
- 10 min 90%

AT
ALL TIMES
ASK:
DO
YOU
NEED
HELP?

Increase oxygen (guided by oxygen saturation)

Reproduced with the kind permission of the Resuscitation Council (UK) from Resuscitation Guidelines, 2015
Paediatric Basic Life Support
(Healthcare professionals with a duty to respond)

Unresponsive

Shout for help

Open airway

Not breathing normally

5 Rescue breaths

No signs of life

15 Chest compressions

2 Rescue breaths
15 Chest compressions

Call resuscitation team
(1 min CPR first, if alone)

Reproduced with the kind permission of the Resuscitation Council (UK) from Resuscitation Guidelines, 2015
Paediatric Advanced Life Support

Unresponsive
Not breathing or only occasional gasps

Call resuscitation team
(1 min CPR first, if alone)

CPR
(5 initial breaths then 15:2)
Attach defibrillator/monitor
Minimise interruptions

Assess rhythm

Shockable
(VF/Pulseless VT)

1 Shock
4 J kg⁻¹

Immediately resume
CPR for 2 min
Minimise interruptions

Return of spontaneous circulation

Immediate post cardiac arrest treatment
- Use ABCDE approach
- Controlled oxygenation and ventilation
- Investigations
- Treat precipitating cause
- Temperature control

Non-shockable
(PEA/Asystole)

Immediately resume
CPR for 2 min
Minimise interruptions

During CPR
- Ensure high-quality CPR: rate, depth, recoil
- Plan actions before interrupting CPR
- Give oxygen
- Vascular access (intravenous, intraosseous)
- Give adrenaline every 3-5 min
- Consider advanced airway and capnography
- Continuous chest compressions when advanced airway in place
- Correct reversible causes
- Consider amiodarone after 3 and 5 shocks

Reversible Causes
- Hypoxia
- Hypovolaemia
- Hyper/hypokalaemia, metabolic
- Hypothermia
- Thrombosis (coronary or pulmonary)
- Tension pneumothorax
- Tamponade (cardiac)
- Toxic/therapeutic disturbances

Reproduced with the kind permission of the Resuscitation Council (UK) from Resuscitation Guidelines, 2015

Medical emergencies in the community

Overview
Drug treatment outlined below is intended for use by appropriately qualified healthcare professionals. Only drugs that are used for immediate relief are shown; advice on supporting care is not given. Where the child’s condition requires investigation and further treatment, the child should be transferred to hospital promptly.

Airways disease, obstructive

- **ASTHMA: ACUTE**
  Regard each emergency consultation as being for severe acute asthma until shown otherwise; failure to respond adequately at any time requires immediate transfer to hospital

  - EITHER Salbutamol aerosol inhaler p. 150
    (100 micrograms/metered inhalation)
    BY AEROSOL INHALATION VIA LARGE-VOLUME SPACER
    (AND A CLOSE-FITTING FACE MASK IF CHILD UNDER 3 YEARS)
      » Child 4 years and below: 2.5 mg every 20–30 minutes or as necessary
      » Child 5-11 years: 2.5–5 mg every 20–30 minutes or as necessary
      » Child 12-17 years: 5 mg every 20–30 minutes or as necessary

  - OR Salbutamol nebuliser solution p. 152 (1 mg/mL, 2 mg/mL)
    BY INHALATION OF NEBULISED SOLUTION (VIA OXYGEN-DRIVEN NEBULISER IF AVAILABLE)
      » Child 4 years and below: 2.5 mg every 20–30 minutes or as necessary
      » Child 5-11 years: 2.5–5 mg every 20–30 minutes or as necessary
      » Child 12-17 years: 5 mg every 20–30 minutes or as necessary

  - PLUS (in all cases)

    - EITHER Prednisolone tablets p. 421 (or prednisolone soluble tablets) (5 mg)
      BY MOUTH
      » Child 11 years and below: 1–2 mg/kg (max. 40 mg) once daily for up to 3 days or longer if necessary; if child has been taking an oral corticosteroid for more than a few days, give prednisolone 2 mg/kg (max. 60 mg) once daily
      » Child 12-17 years: 40–50 mg once daily for at least 5 days

    - OR Hydrocortisone p. 420 (preferably as sodium succinate)
      BY INTRAVENOUS INJECTION
      » Child 17 years and below: 4 mg/kg (max. 100 mg) every 6 hours until conversion to oral prednisolone is possible; alternative dose if weight unavailable:
        » Child 1 year and below: 25 mg
        » Child 2–4 years: 50 mg
        » Child 5–17 years: 100 mg
      High-flow oxygen should be given if available (via face mask in children)
      Monitor response 15 to 30 minutes after nebulisation; if any signs of acute asthma persist, arrange hospital admission.

While awaiting ambulance, repeat nebulised beta₂ agonist (as above) and give with

- **Ipratropium bromide nebuliser solution p. 147**
  (250 micrograms/mL)
  BY INHALATION OF NEBULISED SOLUTION (VIA OXYGEN-DRIVEN NEBULISER IF AVAILABLE)
  » Child 11 years and below: 250 micrograms, repeated every 20–30 minutes for the first 2 hours, then every 4–6 hours as necessary
  » Child 12-17 years: 500 micrograms every 4–6 hours as necessary

- **CROUP**
  Dexamethasone oral solution p. 419 (2 mg/5 mL)
  BY MOUTH
  » Child 1 month-2 years: 150 micrograms/kg as a single dose

Anaphylaxis

- **ANAPHYLAXIS**
  Adrenaline/epinephrine injection p. 132 (1 mg/mL (1 in 1000))
  BY INTRAMUSCULAR INJECTION
  » Child 5 years and below: 150 micrograms (0.15 mL), repeated every 5 minutes if necessary
  » Child 6-11 years: 300 micrograms (0.3 mL), repeated every 5 minutes if necessary
  » Child 12-17 years: 500 micrograms (0.5 mL), repeated every 5 minutes if necessary; 300 micrograms (0.3 mL) should be given if child is small or prepubertal
  High-flow oxygen and intravenous fluids should be given as soon as available.

- **Chlorphenamine maleate injection p. 172**
  BY INTRAMUSCULAR OR INTRAVENOUS INJECTION
  May help counter histamine-mediated vasodilation and bronchoconstriction.

- **Hydrocortisone (preferably as sodium succinate)**
  BY INTRAVENOUS INJECTION
  Has delayed action but should be given to severely affected patients to prevent further deterioration.

Bacterial disease

- **MENINGOCOCCAL DISEASE**
  Benzylpenicillin sodium injection p. 323 (600 mg, 1.2 g)
  BY INTRAVENOUS INJECTION (OR BY INTRAMUSCULAR INJECTION IF VENOUS ACCESS NOT AVAILABLE)
  » Neonate: 300 mg
  » Child 1 month-11 months: 300 mg
  » Child 1-9 years: 600 mg
  » Child 10-17 years: 1.2 g
  NOTE A single dose should be given before urgent transfer to hospital, so long as this does not delay the transfer.

- **OR if history of allergy to penicillin**
  Cefotaxime injection p. 307 (1 g)
  BY INTRAVENOUS INJECTION (OR BY INTRAMUSCULAR INJECTION IF VENOUS ACCESS NOT AVAILABLE)
  » Neonate: 50 mg/kg
  » Child 1 month-11 years: 50 mg/kg (max. 1 g)
  » Child 12-17 years: 1 g
  NOTE A single dose can be given before urgent transfer to hospital, so long as this does not delay the transfer.
OR if history of immediate hypersensitivity reaction (including anaphylaxis, angioedema, urticaria, or rash immediately after administration) to penicillin or to cephalosporins

Chloramphenicol injection p. 340 (1 g)
BY INTRAVENOUS INJECTION
- Child 1 month–17 years: 12.5–25 mg/kg

NOTE A single dose can be given before urgent transfer to hospital, so long as this does not delay the transfer.
See also Central nervous system infections, bacterial p. 292.

Hypoglycaemia

DIABETIC HYPOGLYCAEMIA
Glucose or sucrose
BY MOUTH
- Child over 2 years: approx. 10–20 g
  (55–110 mL Lucozade® Energy Original or 100–200 mL Coca-Cola®, both non-diet versions or
  2–4 teaspoonfuls of sugar or 3–6 sugar lumps)
  repeated after 10–15 minutes if necessary

OR if hypoglycaemia unresponsive or if oral route cannot be used

Glucagon injection p. 444 (1 mg/mL)
BY SUBCUTANEOUS OR INTRAMUSCULAR INJECTION
- Child body-weight up to 25 kg: 500 micrograms (0.5 mL)
- Child body-weight 25 kg and over: 1 mg (1 mL)

OR if hypoglycaemia prolonged or unresponsive to glucagon after 10 minutes

Glucose intravenous infusion p. 564 (10%)
BY INTRAVENOUS INJECTION INTO LARGE VEIN
- Child 1 month–17 years: 5 mL/kg (glucose 500 mg/kg)

Seizures

CONVULSIVE (INCLUDING FEBRILE) SEIZURES LASTING LONGER THAN 5 MINUTES

EITHER Diazepam rectal solution p. 212 (2 mg/mL, 4 mg/mL)
BY RECTUM
- Neonate: 1.25–2.5 mg, repeated once after 10–15 minutes if necessary
- Child 1 month–1 year: 5 mg, repeated once after 10–15 minutes if necessary
- Child 2–11 years: 5–10 mg, repeated once after 10–15 minutes if necessary
- Child 12–17 years: 10–20 mg, repeated once after 10–15 minutes if necessary

OR Midazolam oromucosal solution p. 215
BY BUCCAL ADMINISTRATION, REPEATED ONCE AFTER 10 MINUTES IF NECESSARY
- Neonate: 300 micrograms/kg [unlicensed]
- Child 1–2 months: 300 micrograms/kg (max. 2.5 mg) [unlicensed]
- Child 3 months–11 months: 2.5 mg
- Child 1–4 years: 5 mg
- Child 5–9 years: 7.5 mg
- Child 10–17 years: 10 mg
### Approximate Conversions and Units

#### Conversion of pounds to kilograms

</tr>
</tbody>
</table>

#### Mass

- 1 kilogram (kg) = 1000 grams (g)
- 1 gram (g) = 1000 milligrams (mg)
- 1 milligram (mg) = 1000 micrograms
- 1 microgram (µg) = 1000 nanograms
- 1 nanogram (ng) = 1000 picograms

#### Volume

- 1 litre = 1000 millilitres (mL)
- 1 millilitre (mL) = 1000 microlitres
- 1 pint = 568 mL

#### Other units

- 1 kilocalorie (kcal) = 4186.8 joules (J)
- 1000 kilocalories (kcal) = 4.1868 megajoules (MJ)
- 1 megajoule (MJ) = 238.8 kilocalories (kcal)
- 1 millimetre of mercury (mmHg) = 133.3 pascals (Pa)
- 1 kilopascal (kPa) = 7.5 mmHg (pressure)

#### Plasma-drug concentrations

Plasma-drug concentrations in BNF publications are expressed in mass units per litre (e.g. mg/litre). The approximate equivalent in terms of amount of substance units (e.g. micromol/litre) is given in brackets.

#### Prescribing for children: weight, height, and gender

The table below shows the mean values for weight, height and gender by age; these values have been derived from the UK-WHO growth charts 2009 and UK 1990 standard centile charts, by extrapolating the 50th centile, and may be used to calculate doses in the absence of actual measurements. However, the child’s actual weight and height might vary considerably from the values in the table and it is important to see the child to ensure that the value chosen is appropriate. In most cases the child’s actual measurement should be obtained as soon as possible and the dose recalculated.

<table>

</tbody>
</table>

#### Length

1 metre (m) = 1000 millimetres (mm)
1 centimetre (cm) = 10 mm
1 inch (in) = 25.4 mm
1 foot (ft) = 12 inches
12 inches = 304.8 mm
Recommended wording of cautionary and advisory labels

For details including Welsh language translation, please see Appendix 3

1. Warning: This medicine may make you sleepy
2. Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines. Do not drink alcohol
3. Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines
4. Warning: Do not drink alcohol
5. Do not take indigestion remedies 2 hours before or after you take this medicine
6. Do not take indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine
7. Do not take milk, indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine
8. Warning: Do not stop taking this medicine unless your doctor tells you to stop
9. Space the doses evenly throughout the day. Keep taking this medicine until the course is finished, unless you are told to stop
10. Warning: Read the additional information given with this medicine
11. Protect your skin from sunlight—even on a bright but cloudy day. Do not use sunbeds
12. Do not take anything containing aspirin while taking this medicine
13. Dissolve or mix with water before taking
14. This medicine may colour your urine. This is harmless
15. Caution: flammable. Keep your body away from fire or flames after you have put on the medicine
16. Dissolve the tablet under your tongue—do not swallow. Store the tablets in this bottle with the cap tightly closed. Get a new supply 8 weeks after opening
17. Do not take more than... in 24 hours
18. Do not take more than... in 24 hours. Also, do not take more than... in any one week
19. Warning: This medicine makes you sleepy. If you still feel sleepy the next day, do not drive or use tools or machines. Do not drink alcohol
20. Take with or just after food, or a meal
21. Take 30 to 60 minutes before food
22. Take this medicine when your stomach is empty. This means an hour before food or 2 hours after food
23. Suck or chew this medicine
24. Swallow this medicine whole. Do not chew or crush
25. Dissolve this medicine under your tongue
26. Take with a full glass of water
27. Spread thinly on the affected skin only
28. Do not take more than 2 at any one time. Do not take more than 8 in 24 hours
29. Contains paracetamol. Do not take anything else containing paracetamol while taking this medicine. Talk to a doctor at once if you take too much of this medicine, even if you feel well
30. Contains aspirin. Do not take anything else containing aspirin while taking this medicine
Abbreviations and Symbols

Internationally recognised units and symbols are used in the BNF publications where possible.

Latin abbreviations

Directions should be in English without abbreviation. However, Latin abbreviations have been used when prescribing.

The following is a list of appropriate abbreviations. It should be noted that the English version is not always an exact translation.

a. c. = ante cibum (before food)
b. d. = bis die (twice daily)
o. d. = omni die (every day)
o. m. = omni mane (every morning)
o. n. = omni nocte (every night)
p. c. = post cibum (after food)
p. r. n. = pro re nata (when required)
q. d. s. = quater die sumendum (to be taken four times daily)
q. q. h. = quarta queque hora (every four hours)
stat = immediately
t. d. s. = ter die sumendum (to be taken three times daily)
t. i. d. = ter in die (three times daily)

E numbers

The following is a list of common E numbers and the inactive ingredients to which they correspond.

E102 Tartrazine
E211 Sodium Benzoate
E104 Quinoline Yellow
E223 Sodium Metabisulfite
E110 Sunset Yellow FCF
E320 Butylated Hydroxyanisole
E123 Amaranth
